500 c.c. Touring Class.—1, F. Lamb (3½ Premier); 2, S. Poyser (3½ Ivy).

500 c.c. T.T. Models.—1, E. Folwell (3½ B.S.A.); 2, F. Lamb (3½ Premier).

Unlimited Cubical Capacity.—1, E. Folwell (3½ B.S.A.); 2, F. Lamb (3½ Premier).

An informal competition on the knock-out system was held subsequently, competitors racing in pairs. Final: Jones (3½ Ivy) beat S. S. Poyser (3½ Ivy).

Malvern and District M.C.C.

The results of the hill-climb held at Hipton Hill are as follows. *The Motor Cycle* formula was used:

Class I.—Up to 500 c.c., Touring Machines on Time.

	Rider and machine.	Time.
1.	G. H. Skirrow (3½ Rudge)	19⅖s.
2.	B. Bladder (3½ Rudge)	20s.
3.	F. Nickson (3½ Rudge) ... ... / H. D. Wynn (3½ Rudge)	21⅕s.

Class II.—500 c.c., T.T Machines on Time.

1.	F. Giles (3½ Triumph)	19s.
2.	N. Smith (3½ Triumph)	19⅖s.
3.	F. Nickson (3½ Rudge)	20s.

Class III.—Up to 1,000 c.c., on Time.

1.	R. Surman (5 Matchless)	17s.
2.	G. H. Skirrow (3½ Rudge) ... ... / B. Bladder (3½ Rudge)	19⅕s.
4.—F. Nickson (3½ Rudge)		20s.

Class IV.—Up to 1,000 c.c., on Formula.

	Rider and machine.	Fig. of merit.
1.	B. Bladder (3½ Rudge)	459
2.	R. Surman (5 Matchless)	471
3.	G. H. Skirrow (3½ Rudge)	517

Class V.—Up to 1,000 c.c., Handicap Race in Pairs.

	Rider and machine.	Time.
1.	R. Surman (5 Matchless)	16⅕s.
2.	F. Nickson (3½ Rudge)	19s.
3.	H. D. Wynn (3½ Rudge)	21½s.

"The Motor Cycle" Diary of Week-end Club Events.

Aug. 29th and 30th.—Essex M.C. 400 miles reliability trial to York and back.

Aug. 30th.—Birmingham M.C.C. captain's annual twelve hours' ride.

,, 30th.—Bradford A.C. gymkhana.

,, 30th.—Bristol B. and M.C. run to Frome.

,, 30th.—South Birmingham M.C.C. "old crock" hill-climb.

,, 30th.—Walthamstow M.C.C run to Much Hadham.

A.C.U. TRIALS. Group of competitors and spectators motor cycles at the top of Kirkstone Pass on Friday

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

A.C.U. Six Days' Trials.

Sir,—As a competitor in the above, I was pleased to read your comments with regard to White Shaw Moss, and consider that you might have included several other portions of the routes under the same heading as having abnormal surfaces. It is evident to me that the A.C.U. are aware that the present day variably geared motor cycles are so good and so reliable that it is almost impossible to prevent them winning the highest award unless freak hills and surfaces and roads are included, but they should state in their conditions that such roads are to be included, and not make statements to the opposite effect. What the competitors as a whole think of the routes can be judged by the unanimous protests that were handed in to the secretary almost every day. I have been a supporter of the A.C.U. up to the present, but I cannot write words strong enough to express my opinion of their methods of conducting the 1913 Six Days' Trials.

JOSHUA J. DAY, No. 88.

Sir,—I enclose for publication a copy of the letter written by me to the Secretary of the A.C.U., setting forth my reasons for retiring from last week's trials.

C. B. MOSS-BLUNDELL.

[Copy.]

Dear Loughborough,—I beg to inform you that after due consideration I have withdrawn my machine, No. 31, from the trial.

I have taken this step as a protest against the character of the course, for it is impossible to keep up an average of 20 m.p.h. without either risking one's neck in the by-ways or breaking the law on the highways. I do not intend to do either. I would specially call your attention to non-stop section No. 6 of the 18th inst., and to the watersplash lane near Crosby Ravensworth of the 19th inst. Enquiries from the villagers elicited the information that this narrow lane is only occasionally used by farmers for muck carting, and that it is not considered suitable for other vehicles.

In the "General Conditions," page 2, a specific assurance is given as to surface, width, and safety of the roads selected for the trial, and I believe that I am only voicing the opinion of the majority when I state that these conditions have not been fulfilled. I feel that the A.C.U. would have no alternative other than to return the entrance fee to any competitor who desired it, on the grounds that the nature of the trial had been misrepresented in the printed conditions.

Yours truly,

C. B. MOSS-BLUNDELL.

Benzol.

Sir,—In view of the benzole question, which is attracting so much notice nowadays, my experience may be of interest. The benzole I use is 90% obtained from the Gas Light and Coke Co. at Beckton. I test this myself occasionally, and have always found it to be good spirit.

I use it on my 1913 Triumph, and have not altered the jevel or jet in any way. In my carburetter, which is of the standard Triumph pattern, I find that it takes less air than petrol, which is not remarkable. In no case, I suppose, does complete combustion take place, and the air it will take is chiefly a matter for empirical determination.

I took the engine down for the first time after 1,849 miles and found very little carbon. During this period I used about three gallons of petrol. I was emboldened by this to let the engine run for a considerable time longer, an when this was done—it was not done because of knockin or overheating, but simply because I found certain hill which I could climb on top—required a reduction to secon over the steep bits. After 2,629 miles, the amount of carbo taken off the piston and cylinder walls scarcely covered th dial of my speedometer. The carbon was so soft as to b easily removed with a penknife. These figures compare ver well with those of a recent contributor who found it neces sary, on a mixture of paraffin and petrol, to take down hi engine about every 500 miles. I searched the cylinder fc signs of scoring, owing to the acid produced by the burnin of the sulphur, but was unable to detect anything seriou after 4,500 miles. It may be that after all the sulphu compounds do not get completely burnt, but are just swep away through the exhaust.

The benzole I use shows under tests less than 100 grains c sulphur per gallon, which is under .16% by weight. Thi of course, is exceedingly good.

I am pleased to say that I have converted several motorist to the use of this spirit, and always use it when procurabl even when, as sometimes, I have to pay 1s. 6d. a gallo for it. Through traffic I average about 100 m.p.g., and o the open road, at an average speed of 20-25 m.p.h., 12 m.p.g.

F. E. THOMAS.

Re-opening of Roman Roads.

Sir,—I was much interested in your description of th re-opening of a portion of the Fosseway.

No doubt there are many similar stretches of old Roma roads which could be re-opened, with considerable advantag to all road users. Of course finance will have the last wor in the matter, but I should like to direct attention to particular example.

The main road between London and North Wales leave Watling Street at Weedon (Northamptonshire), and passe through Birmingham and Wolverhampton, joining Watlin Street again near Wellington (Shropshire). Most motorist however, in order to avoid the Black Country, leave th main road at Stonebridge and travel along the Old Chest Road, joining Watling Street at Brownhills (route 936 Contour Road Book).

The road between Stonebridge and Brownhills is narro and the surface is in very bad condition; there are al many dangerous cross roads.

I would venture to suggest that the question of re-openin Watling Street between Weedon and Brownhills should b considered. If this were done motorists would be able t follow the old Roman road all the way from St. Albans t within a few miles of Shrewsbury, and would not pas through a single large town *en route*.

The task is not so formidable as might first appear, becaus I believe that some parts of the route are in quite goo condition.

A SOUTHALL.

[By turning off the main road at Daventry and continuin to Kilsby, Watling Street is picked up again just beyon the latter place, and the road to Holyhead is sign-poste all the way by R.A.C. signs. This route misse Brownhills. It is true that the portion from Weedon t Watford Gap might be widened, and the section betwee Watford Gap and Kilsby re-opened—which would give straight run through except for one diversion at Weeford near Lichfield.—ED.]

A 91 year old passenger in a 6 h.p. Enfield sidecar. (See letter from CX1151.)

An Aged Passenger.

Sir,—I am sending you a photograph of myself and my passenger. He is my grandfather, and is ninety-one years of age. It was his first experience of a sidecar, and the old man travelled about thirty miles. We varied from 5 to 50 m.p.h., and no matter whether cornering, traffic dodging, or exceeding the limit, the old man enjoyed it immensely. He simply put his faith in the driver, and then everything came right with him as a matter of course. The machine is a 6 h.p. Enfield, and would tackle anything. Can any of your readers boast of an older passenger than this? CX 1151.

Carburetters and Flexibility.

Sir,—Referring to your leading article of some few weeks ago, I think it would be a most useful thing if the A.C.U. were to hold a proper flexibility and power test for carburetters, and impose such conditions at the test that any "faking" of carburetters would be immediately unmasked. We occasionally see people writing to papers saying they can do 150 miles to the gallon; even if true, this misleads a great number of people who think that with the 150 miles they get everything they should do, whereas probably they get nothing except 150 miles, and no flexibility whatever. One of your correspondents last week calmly talks about his engine turning over at 80 revs. per minute when the clutch is taken out. The same correspondent also alludes to his getting 142 miles to the gallon. The inaccuracy as to the number of revs. he got rather tends to discount his statement as to consumption. I have been conducting recently some exhaustive tests with different carburetters as to fuel consumption, and it is very easy to get big mileage without flexibility, and easy to get flexibility with a heavy petrol consumption. The best carburetter is the one that will give the very slowest running with any variation up to the very highest speed at the lowest petrol consumption.

The conditions which, in my opinion, would be suitable for a carburetter test are as follows:

(1.) Machine to be put on stand and petrol turned on and left like this for half an hour; no petrol to leak from nuts or jets.

(2.) Start engine on stand and let it "tick" over at slowest for fifteen minutes without touching levers.

(3.) Machine to be lifted from stand and started. Easiest starting to count; no flooding permitted.

(4.) The clutch to be engaged and the demonstrator to walk alongside the machine whilst the engine is running with clutch in for fifty yards.

(5.) Machine now to be ridden on top gear as slowly as possible without misfiring, or without any manipulation of the clutch, brake, or valve lifter.

(6.) Machine now to be ridden at speed of twenty-five miles per hour for one hundred yards, and then easing down to seven miles per hour. This to be repeated twenty times.

(7.) Machine to be driven at full speed for five miles.

(8.) Machine then to be ridden up a hill one mile long with a gradient in parts of 1 in 6.

(9.) Machine to be ridden down the hill.

(10.) Petrol consumption to be then measured off.

(11.) No adjustment to be made to the carburetter from start to finish and the h.p. and gear of the machine to be the same in all cases.

I should be very pleased to enter one of my carburetters for such a test. CHAS. BINKS.

Hub and Counter-shaft Gears.

Sir, -I must protest against the remark made by "AN 1231" that "hub gears will not stand the kick of a healthy 3½ h.p."

I am a commercial traveller, and during the last eighteen months I have ridden a 3½-4 h.p. New Hudson, Armstrong three-speed hub, with sidecar attached. This machine has done over 20,000 miles to date, and puts me very much in mind of "Tennyson's Brook." The gears and clutch have never given any trouble whatever, and when dismantled for cleaning a month ago there was barely a trace of wear visible. A brother commercial has a 1911 model of the same make, which has given equal satisfaction. Both clutch and gears are as good as ever after more than two years' hard work.

If the hub is fitted correctly in the first place, and systematically oiled and kept in adjustment, which latter is a very simple matter, it will be found perfectly reliable and give no trouble at all.

In conclusion, I beg to say I have no interest in Messrs. Armstrong or the New Hudson Co., except my complete satisfaction with their goods. H. T. SANDERS.

Sir,—In reply to Sturmey-Archer Gears, Ltd., I should like to ask whether their remarks apply to two-speed countershaft gears? If so, their statements are certainly incorrect.

The chain on my last year's Douglas lasted 7,500 without breaking; the chain on my 1913 model has run 4,750, and has been tightened once. The letter says nothing about belt wear and adjustment. The Pedley belt on my present machine has been shortened three times and has not pulled through once; it shows practically no sign of wear after 4,500 miles. I might add that the engine has not yet been taken down for cleaning, or the valves ground in, and it is still running well. F.R.C.S., O 7692.

Sir,—As one whose business occupation renders him entirely dependent upon his motor cycle, I feel that I must comment upon a statement that appears in Mr. Harold Bowden's letter in your issue of August 14th.

I am obliged to consider reliability above all things in my mount, and this leads me to watch carefully all improvements, and to satisfy myself that they can be relied upon before adopting them. I am perfectly satisfied as to the reliability of the hub gear, but have not yet adopted it because I consider it means increased delay in the case of removal of the back wheel. Mr. Bowden somewhat airily dismisses this objection to the hub gear by saying that this advantage (of the counter-shaft gear), of course, only applies to the novice. But I believe I am voicing the opinion of many other business riders when I say that this objection has a much wider application. As a "novice" I revelled in tinkering and adjustment, but I prefer as little as possible nowadays. And I want to be able to execute any necessary repairs in the shortest possible time and with the least possible trouble. That is my sole reason for not adopting the hub gear, and why I await the counter-shaft three-speed gear and the "clean back wheel." TAURUS.

Sir,—Upon the advent of the counter-shaft gear some years ago, much correspondence filled the pages of your valuable paper as to the merits of the counter-shaft gear as compared with its rival the hub gear, and now that some knowledge has been obtained, a further interchange of ideas is to be welcomed. I have since had some experience with both, and, although the counter-shaft gear is my favourite, I will admit that it is far from being perfect. A most surprising fact is that practically no development has taken place in the counter-shaft gear beyond the method of control; the original crude pattern being to a great extent copied by every manufacturer to adopt it.

Many of the objections in connection with counter-shaft gears as summarised by Mr. Bowden are most certainly due to faulty design, and not to the position of the gear.

The noise occasioned by high speed should be overcome as it has been in motor cars. The driving shaft in a

car gear box runs at engine speeds, but the driving shaft of a motor cycle gear box is geared down, hence the difficulty is not insurmountable.

The fierce drive is a matter of clutch, not gears. If the clutch is adjusted to give a relative amount of slip, as is unavoidable in a hub gear, any fierceness will disappear.

Vibration in the gear box can only be attributable to either badly cut and ill meshing gear wheels or to shafts being out of truth.

I can hardly agree that the advantage of simplicity of removing a back wheel applies to novices only. Surely it is the desire of even the most experienced rider to be able to change tyres or effect any repair with the greatest saving of time and trouble to himself either in the workshop or on the road. Is it only the novice, who, when choosing a mount, looks to see whether he will have to drop the crank case out of the frame before removing the cylinder?

In conclusion, I should like to state that I have no interest in the subject from a business point of view, as I am an ordinary "half-holiday" sidecarist who owns a machine with a hub gear and a happy nack of keeping his temper under trying circumstances. F. L. PARSONS.

Sir,—I was very interested to read Mr. Bowden's letter on hub and counter-shaft gears. My experience with counter-shaft gears has been entirely different from his.

My counter-shaft gear is a two-speed 4 h.p. Jardine, gear ratios of 4:8 and 9.6 to 1 respectively. It has a cork clutch and two very efficient shock absorbers, one being fitted on the engine-shaft. The gear has been in use since November 1st, 1912, and has covered almost 9,000 miles. I do 150 miles weekly, in all weathers, in course of my business, besides much running in trials and for pleasure purposes. I have never, on a single occasion, been "hung up" with gear or transmission trouble during the last eleven months.

I am highly pleased with the gear, which is quite free from noise or vibration, the slight whirr of the chains is far from objectionable.

The original chains are still on, the front chain is in better condition than the rear chain, owing, no doubt, to its being better protected. The chains will soon need renewing as both begin to show signs of stretching. They have had, nevertheless, a good "innings."

I have only had to replace a tyre—the original rear tyre, a 2½×26 Dunlop rubber-studded, having run 7,000 approximately from November to May. When I took it off the tread had worn right down to the canvas in two places only, and the bead was in a fair condition. The rubber studs of my present rear tyre, a 26×2½ Hutchinson Brooklands, are only just worn down after 2,000 odd miles.

The transmission is not in the least harsh. It is silky—even smoother than belt transmission. This is due to the two shock absorbers. I am able to start from a standstill with sidecar and passenger on top gear on a slight up grade by means of the clutch. I have even stopped and restarted on Matlock Bank. The effect is like gliding off in a Rolls-Royce. No replacements of corks have been made as I am free from clutch slip even after 9,000 miles. After the first 1,000 miles I had to adjust the clutch tensioning device and also the throw-out pedal. These have not needed adjustment since. My machine is a pleasure to ride in traffic. I move along at a crawl without any jerkiness whatever.

As regards the accessibility of the back wheel the counter-shaft gear scores over the hub gear. Who—whether expert or novice—when attacked with tyre trouble, when it becomes necessary to change a tyre or a tube on the road, wants to do the work demanded by some of the present two or three-speed hub gears before the wheel can be removed.

In 1911 I rode a machine fitted with a very heavy two-speed hub gear. Unaided, it required at least well over one hour to remove and replace the wheel alone. I also had several skids on greasy sets and on wood blocks, caused almost solely by the tremendously heavy rear member of the machine. Most of my most expensive tyres were scrap at 1,500 to 2,000 miles, and some barely reached 1,000 miles with careful riding solo. I do not see how one can get normal tyre wear with a heavy hub gear. As there is quite sufficient work for the rear tyre to do I do not believe in piling on extra in the form of heavy gears in the hub.

With my two-speed hub gear frequent adjustment was necessary to the bands and rods. There was also considerable noise caused by the gear when the engine was runni free on stand or was shut off when going downhill.

Mr. Bowden's gear has no chains to lubricate that certain, but what about the care of the belts, their adjus ment, slipping in wet weather, and such defects? Wit chains that is a thing of the past. No motor cyclist, who a motor cyclist, minds lubricating and properly adjusti his chains. The latter is seldom necessary, and giv intelligent care and usage chains will give next to no troubl

In my experience a counter-shaft gear box and cha transmission, with efficient clutch and shock absorbers, the thing for a motor cycle engine—single or multi-cylinde

In conclusion, I beg to be excused for the length of n letter, but at the same time I think it will be of interes I would also like to state that I have no connection wi Jardine's, of Nottingham, but am one of those who like speak of an article as I find it. JAMES A. HARDY.

Fair Treatment.

Sir,—Some little time ago, a friend and I, bo riding Rudge machines, were proceeding to Bristol, wh upon reaching Evesham, my friend's machine gave out wi a cracked piston. After many suggestions as to what do for the best, I telephoned to the Rudge-Whitwor Works at Coventry asking if they could suggest anything.

Mr. Holroyd, the works manager, gave us every sympat and said he would see what could be done, which he did in a most practical form, viz., sent a smart mechanic, ful equipped, with tools and a new piston, at express speed a Tourist Trophy machine, a distance of thirty-three mil to us at Evesham. The rapidity with which the new pist was fitted and the machine overhauled and tested was real a marvellous piece of smart workmanship, inasmuch th only twenty minutes was occupied to complete the wh repair. When asked the cost of repairs we were inform that there was no charge, and that the company were pleas to be of service to us in our troubles. BOB HARRIS.

Sir,—Perhaps the following details of my experience wi a Sturmey-Archer hub may be found of interest to th of your readers who are contemplating the addition of three-speed gear to their motor cycle.

I had the gear fitted to my machine by a local firm, b found it did not run satisfactorily. I took the machi back three or four times, and was disappointed each tin Finally, I decided to take it to the makers of the gear, a did so. On the second day I received my machine ba and I was never asked to pay one penny piece. Since th I have run the machine with the greatest pleasure, and ha given it a good testing before sending this letter. I ha toured the Lake District and South Wales, and with p senger and sidecar have climbed each hill without troubl G. R. DREWERY.

SIX DAYS' TRIALS. Hugh Gibson (Bradbury) is seen rounding the acute bend on Crossdale Hill on the third day.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Planning Tours.

Will you please give me a nice motor cycle tour through the Lake District and in Scotland. I have plenty of time.—F.M.R.

We regret we cannot undertake to work out tours. What you had better do is to become a member of the Auto Cycle Union (89, Pall Mall, S.W.), touring membership of which only costs 5s., or the A.A. and M.U., Fanum House, Whitcomb Street, Coventry Street), and apply to the Touring Department.

Birmingham to the West.

I shall be much obliged if you can tell me the best route from Birmingham to Plymouth, and back by another route. Also, do you know of any holiday camps near Plymouth?—A.W.

Your best route would be as follows: Birmingham, Alcester, Evesham, Cheltenham, Painswick, Stroud, Nailsworth, Bath, Radstock, Wells, Glastonbury, Taunton, Cullompton, Exeter, Chudleigh, Ashburton, Plympton, to Plymouth. We do not know of any holiday camps in this district. Return: Ivybridge, Totnes, Newton Abbot, Exeter, Taunton, Bridgwater, Bristol, Gloucester, Tewkesbury, Worcester, Bromsgrove, Birmingham.

Strangers and Taxation.

I am home from China, and should be glad if you can tell me if a local taxation licence taken out, say, in the London County Council, is sufficient anywhere in Great Britain? Also if facilities are given to non-residents of Great Britain, who may be touring here just for a month or six weeks, or does everyone, even a guest in England, have to pay the £1 tax for a motor cycle?—W.C.W.

Yes; one local taxation licence taken out at any Post Office in Great Britain is sufficient. We are under the impression that the local taxation licence has to be paid except in cases of foreign tourists entering the country under the International Touring regulations, which apply to those countries which have agreed to these regulations, *e.g.*, anyone coming from China, with which there is no agreement, would have to take out the local taxation licence, whereas a motor cyclist coming from France, under the auspices of the Automobile Club of France or the Touring Club of France, can enter under the International regulations for the sum of 7s. 6d., and be free to travel in this country without payment of further taxes

"Klipdam to Ecclefechan."

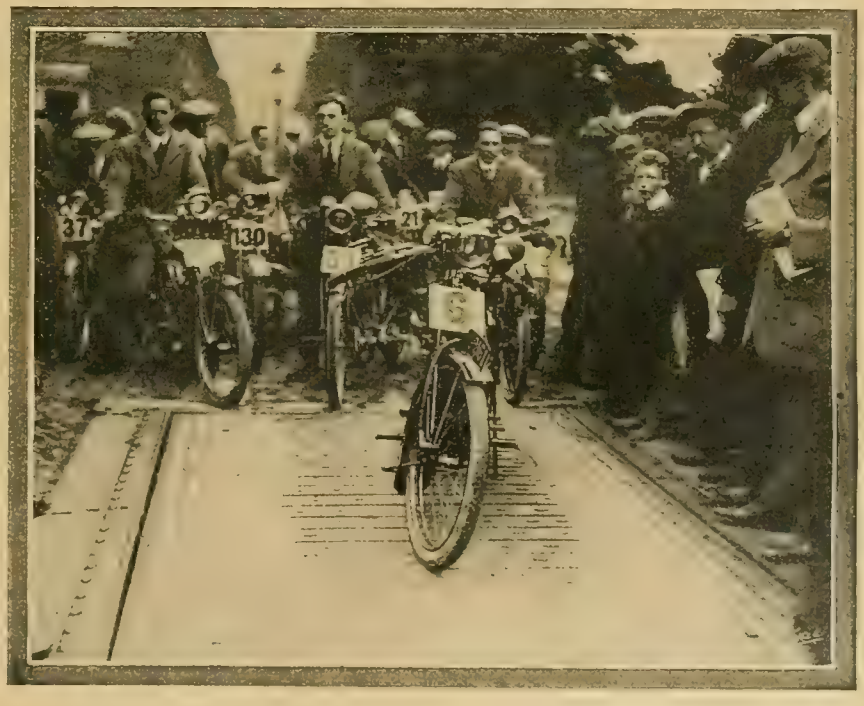
There's no limit to your usefulness. Please state best route for 3½ h.p. free model bike from "Klipdam Cape to Ecclefechan," embracing Jericho, Archangel, Greenland's Icy Mountains, The Grey Mare's Tail, and Wamphray Glen, enumerating cheapest petrol depots *en route*, also borough councils who are "dead nuts" on the speed limits. Guid luck to the world-wide known journal.—"TRIUMPH EXPONENT."

We recommend the following route: Klipdam Cape, Woolloomooloo, Madagascar (have the barnacle deposit scraped off the cylinder heads here), Tyre, Jericho (do not ride round the city near the walls, they are notoriously unsafe), Astrachan, Nijni Novgorod (rather crowded at fair time), Archangel (fit a warming device to the carburetter), Greenland's Icy Mountains (be careful of side-slip), The Back of Beyond, The Horsehoe Falls, The Grey Mare's Tail. 50° north and 40° west, Wamphray Glen, Ballybunion, Upper Tooting, Ecclefechan. to come recent trials routes.—ED.]

Petrel, the "Stormy" brand, is common in the Pacific Ocean, and any amount of Shell can be obtained quite cheaply at most seaside resorts. Any old fossil will direct you. Another well-known brand of spirit can be procured at the "Devil's Punch Bowl."

You will do well to remember that the speed limit is very strictly enforced in the Arctic regions, and that the descent of the Horsehoe Falls may be considered to be quite dangerous. In fact, we believe that this noted acclivity has never yet been climbed. On passing through any district ruled by a dusky potentate take care to placate the genial private secretary.

[We make no apologies for publishing the above route query, as the journey is of considerable interest to the touring public, and bears a striking similarity to some recent trials routes.—ED.]



Showing how the competing machines in the A.C.U. Trials were weighed. Some competitors thought the scales were inclined to err on the heavy side.

Cambridge to Brighton.

Will you please state the best route from Cambridge to Brighton, missing London and the largest towns.—O.J.

Your best route would be as follows: Cambridge, Royston, Baldock, Stevenage, Welwyn, Hatfield, St. Albans, Watford, Rickmansworth, Denham, Uxbridge, Staines, Chertsey, Weybridge, Cobham, Leatherhead, Dorking, Reigate, Crawley, Handcross, Piecombe, Brighton.

Engine Stops when Hot.

I have a 1911 Kerry-Abingdon fitted with free engine in rear wheel, and Brampton variable pulley, B. and B. carburetter, and coach-built sidecar. The engine overheats, and if I get on a long hill it will pull up suddenly, but if I wait a few minutes it will pick up and run well. If I run for ten miles on the level with the throttle well open, the result is the same. If I am on a switchback road, where I can keep lifting the exhaust, it will run very well and climb nearly anything. I have plenty of air to play with, and it is the same on petrol or benzole. I have cleaned the cylinder and piston head, fitted new rings, ground in the valves, and made fresh joint on the induction pipe, but still it is the same. It also exudes a lot of oil from the crank case.—J.C.

The symptoms you describe point to the piston being rather a tight fit in the cylinder. If this is the case a few hundred miles light running with plenty of lubrication and good oil should greatly improve matters. If this is not the case it is very probable that one or both of your valves tend to stick in the guides when the motor becomes hot. Take the valves out and examine the stems to see whether they are perfectly straight. Smooth them off slightly with emery paper and lubricate with some graphite before replacing. This should improve the running immensely. Also check the magneto timing.

Two Tours from London.

I should feel obliged if you will kindly inform me: (1.) The best route from London to Paignton (S. Devon), approximate distance, and condition of road surface encountered. (2.) Also the same information with regard to the route from London to Windermere.—J.P.

(1.) Your best route would be as follows: London, Staines, Bagshot, Blackwater, Basingstoke, Whitchurch, Andover, Salisbury, Shaftesbury, Yeovil, Chard, Honiton, Exeter, Chudleigh, Kingsteignton, Paignton. The distance is approximately 217 miles. The road is fair all the way. (2.) Your best route from London to the Lakes is *viâ* the Great North Road, through Barnet, Hatfield, Stevenage, Baldock, Eaton Socon, Stamford, Grantham, Newark, Tuxford, Retford, Doncaster, Ferrybridge, Aberford, two miles south of Wetherby turn left and go through Harewood, Otley, Ilkley, Skipton, Settle, Ingleton, Kirkby Lonsdale, Kendal, Windermere. The distance is approximately 272 miles. The condition of the road is fairly good throughout.

Cheshire to Devon.

Will you kindly give me particulars of the best route to Ilfracombe, avoiding towns as far as possible; also, say the distance, kind of roads, and where would be the best place to stay the night? I presume the journey could be done in two days with 3½ h.p. motor cycle and sidecar.—A.M.

Your best route would be as follows: Sandbach, Crewe, Nantwich, Market Drayton, Hodnet, Wellington, Bridgnorth, Kidderminster, Worcester, Tewkesbury, Gloucester, Stroud, Nailsworth, Bath, Chewton Mendip, Wells, Glastonbury, Durston, Taunton, Wiveliscombe, South Molton, Barnstaple, to Ilfracombe. The distance is approximately 300 miles. You had better stop the night at Gloucester.

Overheating Troubles.

I have a 3½ h.p. Bradbury motor cycle, and would like your opinion on the following difficulties. I can only get about 60 m.p.g. of petrol with a 33 jet, and the machine will not take extra air if a smaller one is fitted. After the engine gets heated up I find that it knocks when picking up after slowing down, and also when climbing, although I retard the spark and close extra air. The gear is 5 to 1, and the belt is not too tight. The engine has developed a crack in the exhaust valve seat. Can this be repaired, and, if so, could you give me the name of a reliable firm of repairers in the north.—J.K.

You might try if you can use the 32 jet, and then see if the consumption is going up through petrol being splashed about from the filler cap and leaking from the unions. An appreciable amount of petrol is sometimes lost in this way on a motor cycle. The knocking may be due to your using too weak a mixture when picking up speed, or to the engine requiring to be cleaned of carbon deposit. If you have a crack in the exhaust valve seating it would certainly cause loss of compression and loss of power. These cracks are difficult explain the position and size of the crack to repair. You had better write and to Messrs. Lea and Son, Runcorn.

Low Tension Magneto Difficulty.

I have a twin-cylinder Laurin and Klement 83 mm. × 96 mm. fitted with low tension magneto. I should be grateful for assistance on the following points with regard to the ignition. There are internal rocker arms actuated by a cam fitted to an extension of the half time shaft. These are both connected to a wire, which, by a single wire, is connected to the magneto. Is this correct? At what point does the spark occur, when the rockers strike or when they break? At what position of the piston should the rockers break? What is the correct gap between the rockers? Are the makers of this machine still in existence? If so, can you give me their address? Who made the magneto fitted to this machine?—B.G.

With the low tension magneto ignition fitted to the old twin-cylinder Laurin-Klement motor cycles the spark occurs when the make and break inside the cylinder separates. This should occur at approximately the top of the stroke of the piston—if anything a trifle before rather than after, but if it occurs at the top of the stroke it will be quite satisfactory. Within comparatively wide range the gap does not much matter. This form of ignition has the advantage of giving the largest spark at the highest speeds, and except to facilitate starting it is an advantage to have a fairly wide gap. Set it as wide as you can commensurate with easy starting. The makers of this machine are still in existence, and their address is Laurin and Klement, Jungblunzau, Austria. They made their own magneto as far as we are aware.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"C.F." (Worthing).—A.C. Sociable (two-seater). Best gear for hills; general information for novice.

"B.W.H." (Sutton Coldfield.)—5 h.p. twin Hazlewood (Jap) 1913 fitted with Armstrong gear. Reliability and wearing qualities.

THE CAMPION CYCLE CAR.

A neat cycle car is being marketed by the Campion Cycle Co. of Nottingham. The engine is an 8 h.p. J. A. P., the drive being transmitted through friction gear to a countershaft and thence by one inch belts to the rear wheels. Five speeds forward and one reverse are obtainable, and 650 × 65 tyres are fitted throughout. A Solex carburetter supplies the mixture.

SHAMROCK-GLORIA BELT

MADE IN ALL SIZES

S.E. TYRES give better and longer service than any other.

Equally superior for SOLO or SIDE-CAR use.

S.G. BELTS are the only rubber belts to win the T.T. Races 3 years in succession. Order a Shamrock-Gloria and get SATISFACTION.

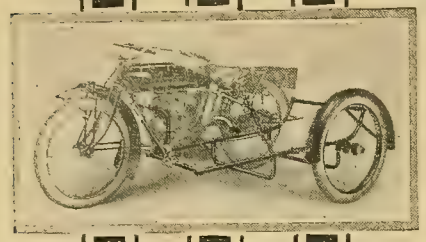
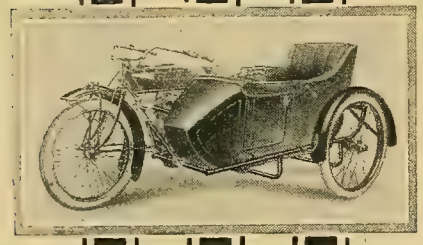
The First Practical Sidecar for the 1913 Spring Frame

Indian





This new model (P.M.C. No. 21) Sidecar is specially designed for the 19 Spring Frame "Indian." The five attachments all fit to rigid members of t motor cycle frame; and thus all sideway and strain are avoided, the re spring frame working as free as if the machine was ridden solo. The chas and body are painted to exactly match the machine.

Other salient points are as follows:

FRAME.—Rectangular pattern, of great strength—Five Point attachment.
SPRINGS.—Double Cee Springs, hung on special plates brazed to frame. Do not rub on frame.
FITTINGS.—P.M.C. Patent Quickfit Couplings—Sidecar can be attached or detached, without to inside three minutes.
BODY.—Coachbuilt Torpedo, luxuriously upholstered, with spring back and spring cushion. Lugg well under seat.
WHEEL.—28 x 2¾in. Spindle diameter, 1 inch.
TYRE.—28 x 2¼in. Dunlop or Continental.

Hood or Wind Screen fitted at extra charge.

PRICE, complete, £15 15 0.

New Edition. ***Now Ready.***

SIXTEENTH EDITION REVISED and ENLARGED

THIS new edition of "Motor Cycles and How to Manage Them," is, in many ways, a great improvement on its predecessors. It has been entirely revised and brought up-to-date by the staff of "The Motor Cycle." 50 extra pages and nearly 100 new illustrations have been added. The chapters on the Carburetter, Transmission, and Gearing, have been enlarged considerably, and form a very important feature of the new edition. New matter is included dealing with Cycle Cars. Every user of a motor cycle, and every purchaser of a new or second-hand machine will find this book interesting, instructive, and helpful.

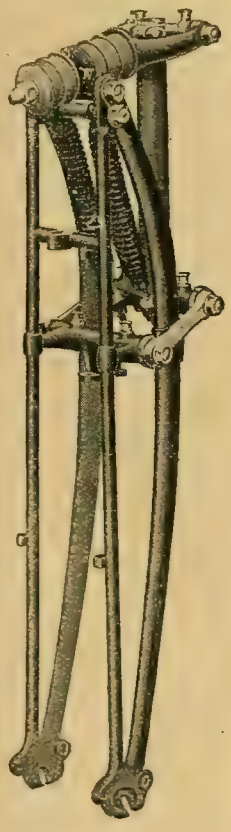
THE "BRAMPTON BI-FLEX" Spring Fork

Absorbs both vertical and horizontal shocks

Other makes absorb shocks in one direction only—generally vertically.



In the Brampton Bi-flex Fork the girder is attached to the bottom of the steering column by links, and a pair of springs absorb vertical shocks. The top of the girder is not held by links, but cushioned between two sets of rubber buffers, and moves backwards or forwards under horizontal shocks. These two movements taking place simultaneously absorb all shocks, the buffers damping out any tendency to bounce.

The bearing surfaces are large, and adjustment is provided to take up wear in the links.

This fork gives a high degree of comfort unobtainable by any other make, whilst two years of continuous testing have proved its reliability and durability.

Descriptive pamphlet free on request.

BRAMPTON BROS. LTD., Oliver St. Works, Birmingham.

What does it mean to you?

IS the act of "Lighting Up" an occasion of trouble and anxious uncertainty by reason of an inefficient and unreliable Lamp?—it should not be—and *need* not!

—EQUIP YOUR MOUNT WITH A "P. & H." LAMP!!—Model 127C—its marked superiority and efficiency will ensure perfect service and relieve you of all trouble and uncertainty here. Its powerful, penetrating light and absolute dependability will give you a sense of perfect security and safety—ensuring your riding with an easy mind, always.

MODEL 127C.

PROJECTOR of extra large size, has 6½in. Front with large Hood Reflector; very powerful best quality 5in. real Mangin Mirror Reflector; Bray "RONI" Burner, which cannot crack lens or reflector, fitted into a perfect arrangement for adjusting; and 5½in. Plate-glass Convex Lens. Special GENERATOR can be easily cleaned and recharged; with adjustable stamped steel DOUBLE CARRIER of new design and exceptional strength to withstand excessive vibration, complete with best grey Rubber Connection. Can be easily fitted on handle-bar stem, or lamp bracket.

Price: Nickel or Ebony Finish, complete 36/6

R.11.5.

BROUGH IN THE SCOTTISH 6 DAY

BACK COVER—Loss of Weight only 4¼ oz.

FRONT COVER—Loss of weight only 1¼ oz.

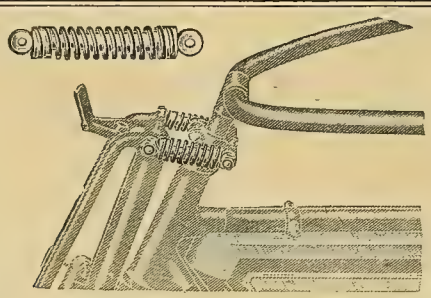
AND THOSE ARE THE TYRES HE RODE →

Everybody knows that Brough's achievement in the Scottish Six-Day was the "star performance"—he rode a 6 h.p. Twin Brough with single gear and sealed tool bag, won GOLD MEDAL, and came through with flying colours.
And the

JOHN BULL Tyres & Belt

were largely—very largely—responsible for his success.
Here you see them as actually photographed after the performance—note the meagre wear—remember the roads they covered (the photograph above is typical) and—
Say if the John Bull Tyres and Belt will serve Brough so successfully are they not worthy of your consideration? We think so and suggest you ask for latest Booklet.

Leicester Rubber Co., Leicester.



TERRY'S SPRING LINK absorbs road shocks.

It is a wonderful auxiliary to motor cycle front fork springing—taking up all the shocks uneven road surfaces create and imparting to the motor cycle the comfortable easy gliding motion of the car. Vibration is reduced to a minimum—and, of course, great economy in running costs is effected. It can be fitted to any front fork of link type. For 3 h.p. machines **10/-**, 6 h.p. **12/6** per pair. Write now for descriptive leaflet—It is post free.

HERBERT TERRY & SONS,
The Spring Specialists, REDDITCH, Eng.

CYCLE CARS

need and deserve good lubricants. Their engines are called upon to work under more severe conditions than most motor cycles. Double loads, lower gears, and increased windage all call for more throttle opening and the need of the best oil.

The following are a few types, with the most suitable lubricants for each:

HUMBERETTE **MORGAN** **G. N.**	fitted with medium compression air-cooled engines for which SUMMER HUILE DE LUXE is specially suitable.
SWIFT **SINGER** **G. W. K.**	fitted with water-cooled engines requiring a water-cooled engine oil of good body, such as MOTORINE C.

Don't libel your lamp

when the flame fluctuates and goes up and down like water in a gauge; ten to one the carbide is the culprit, and doesn't give the lamp a chance.

Use G.B., the reliable carbide, the carbide that never "lets you down."

G.B. is 100% carbide. It is prepared with scrupulous care, every particle of dust and foreign matter being removed. It is protected by our own special process of coating, and the quality never varies.

G.B.
CARBIDE

gives the user a feeling of safety, insomuch that it can always be depended upon to give a clear, steady light.

Get the "G.B. Label"; it's good!

Prices:

MOTOR BICYCLES FOR SALE.

MOTOSACOCHE, 1¾h.p., mag., h.b.c., Watawata, direct drive, Palmer, runs well; £15.—Bradleigh, 21, Graham Rd., Weston-super-Mare. [1021

1910 Humber, Roc 2-speed, handle starting, splendid condition, hub wants seeing to; sacrifice £17/10, rare bargain.—Cutland, poultry fancier, Wellington, Som. [X7306

TRIUMPH, 1909, splendid condition, just re-bushed and overhauled, tyres almost new; £22, or near offer.—Box L3,959, *The Motor Cycle* Offices, 20, Tudor St., E.C. [1127

TRIUMPH, 3½h.p., clutch model, late 1909, recently overhauled by makers, in splendid condition, with lamp, horn, and spares; a bargain, £26/10.—A. Baker, Beaworthy, Devon. [X7436

TRIUMPH, clutch model, good condition, £38; New Hudson, 1913, and Canoelet sidecar, 72 gns.; Rex, £16; Victoria Precision, 1913, 2½h.p., new, £33.—Harris, Parade, Exmouth. [2542

3½h.p. Rudge, sidecar, new Armstrong 3-speed, Cowey, £35; 3½h.p. Triumph, fixed engine, £30; 3½ h.p. Quadrant, Bosch, Auto Varia, free engine, £12.—A. Davey, Moorland Rd., St. Austell. [X7234

PREMIER, 2½h.p., 1912½, Sturmey-Archer 3-speed and clutch fitted 1913, new belt, spares, splendid condition, spare tube and case; £28; approval.—Box L2,488, *The Motor Cycle* Offices, 20, Tudor St., E.C. [0920

NEARLY New 3h.p. Motor Cycle, latest 1913 model, Armstrong 3 speeds, and free engine, spares, etc., complete, cost over £50, will accept 36 gns., or what offers? Mabon free engine clutch and variable pulley combined, cost £3/10, will accept 50/-.—Young, Misterton, Somerset. [X7286

SECTION X.

Scotland.

3½h.p. Rex, £10; 5h.p. N.S.U., £14; 3½h.p. Humber tricar, £8; must sell.—Frazer's Garage, Largs. [0931

3½h.p. Humber, free engine, chain drive, good condition; accept £9.—McCulloch, 2, Jamieson Terrace, Troon. [0889

MOTOSACOCHE, 1912, 2½h.p., good condition, only done 1,800 miles; buying heavyweight.—Farquhar, Pitscandly, Forfar. [X7315

N.S.U., 5-6h.p., 2-speed, V.M. Pillion seat, Cowey speedometer, perfect condition; £20, or nearest.—McCormick, Polmont Station, Stirlingshire. [X7502

ABERDEEN and District Agent for Scott, Levis, P. and M., A.J.S., Matchless, and Sun, also Premier cycle car; any other make supplied.—George Cumming, 165, Holburn St. [9406

GLASGOW Agents for Indian, Bat, Royal Enfield, Williamson, B.S.A., Zenith, Norton, Rex-Jap, Trump, also G.W.K. cycle cars, Ford cars.—Alexander and Co., the leading Scottish firm, 272, Gt. Western Rd., Glasgow. [X6302

EDINBURGH.—Agents for Indian, Phelon and Moore, Douglas, Williamson, Zenith, Matchless, B.S.A., Bradbury, Norton, Royal Enfield, Premier, Rex, Rex-Jap, Trump, also G.W.K., Ford cars.—Alexander and Co., Scotland's largest motor cycle dealers, 115, Lothian Rd., Edinburgh. [X6301

SECTION XI.

Ireland and Isle of Man.

3½h.p. 1912 Free Engine Triumph Motor Cycle for sale, in perfect order.—R. G. Stewart, St. Mary's Terrace, Sligo. [X7273

CYCLE CARS.

MORGAN 1912 Sporting Models, complete, lamps etc., good tyres, and chains; £68.—Below.

HUMBERETTE, latest 1913 model, used for two demonstration runs; £115.—Below.

CALTHORPE, 1913, 10h.p., specially tuned for demonstration car, and winner of Shelsey Walsh hill climb; £135.—Below.

CYCLE Cars.—Before purchasing a cycle car, call and see me. I can give immediate delivery of Perry-Standards, Calthorpes, Humberettes, Alldays, Midget Fords, G.W.K., Singers, etc. Tel.: 662 Midland.—J. J. Evans, John Bright St., Birmingham. [X736

CYCLE Car Chassis, complete, less engine and tyres, perfect; £10.—Hughes, Electrician, Selly Oak. [X742

DUO Sociable, all accessories, fine condition throughout, new last August; offers.—Rowley, 35, Lumley Rd., Skegness. [066

A.C. Sociables for reliability, £75; demonstration run arranged.—Sole Devon agents, Moon Bros., Duke St., Plymouth. [X56

BEDELIA De Luxe, late 1912, hood, screen, lamps complete, accept £72.—Chalmers, 67, Scholefield St., Birmingham. [X746

HURLIN and Co., 295, Mare St., Hackney.—Brand new Turner cycle car, 10h.p., unused; listed £220, our price £150. [109

HURLIN and Co., Hackney.—Sabella, 8-10h.p. J.A.P. cycle car, 1912; best offers wanted.—Hurlin and Co., 295, Mare St., Hackney. [109

HUMBERETTE, 1913, £120, unused, practically new.—Hurlin and Co., 295, Mare St., Hackney (2 doors Hackney Empire). [109

A New Road Problem.

A JOURNAL, which is known for its enterprise in many directions, has lately taken motor cycles under its care. In so doing, our contemporary has discovered a new road problem, none other than the congestion of the highways by motor cycles in the near future. This is all the more interesting, as some few years back this same organ gave it out authoritatively that motor cycles were dead and were doomed to disappear, and that in a year or two we should not see such things on our roads any more. How near this prophecy was to the truth may be left to the imagination. Now, burying its former prophecy, it indulges in another: that in the near future motor cycles will out-number cars; but in this case we regret we cannot share such an optimistic view, for, as a matter of fact, probably largely due to the influx of cheap American cars, the number of motor car owners has lately increased in even greater ratio.

Still the increase in motor cycles has been wonderful, and this increase is naturally very pleasing to everyone interested in the welfare of the movement, but we do not think there is any need to become flustered at the number of these machines, "which are as thick as flies upon the great roads that lead out of London." With the memory of the start of the recent Six Days Trials fresh upon us, we cannot recollect that the 160 competitors and innumerable officials and lookers-on mounted on motor cycles made even the streets of Carlisle appear at all crowded. Half a dozen cars will block up a road far more than five-and-twenty motor cycles, and, if it comes to obstructing the road, one road hog on a car is more of a nuisance than a whole club of riders on the single track machine.

A total of 200,000 motor cycles is looked for "in the near future" by a "traffic authority," but if we multiply this figure by ten in years to come, we do not anticipate the King's highway will be unpleasantly crowded. There is a ray of consolation, however. These machines are not all to be ridden by speedmen. The advent of the sidecar is having a sobering effect on speed. No longer will the most ardent speed maniac scorch—instead he fills his sidecar with feminity and becomes a sober tourist. Still, we prefer to keep our heads, believing that our highroads are capable of accommodating any traffic likely to be put upon them.

One point more—a motor cyclist, even if a rash rider, will always do his best to avoid a collision, for, as he rides an unstable vehicle, there is every prospect of injury to himself and a valuable machine.

The Olympia Show.

THE fourth International Motor Cycle, Cycle Car, and Accessories Exhibition, which will be open on November 24th next and remain open until Saturday, the 29th of November, promises to be even more successful than its predecessors. Elsewhere in this issue we publish a plan of the main hall, showing the positions of the exhibitors of complete machines and some of the accessory firms. Some dissatisfaction was expressed last year at the large amount of space devoted to business offices in the annexe; this year this space has been considerably reduced and a portion of the annexe given over to tyre exhibitors.

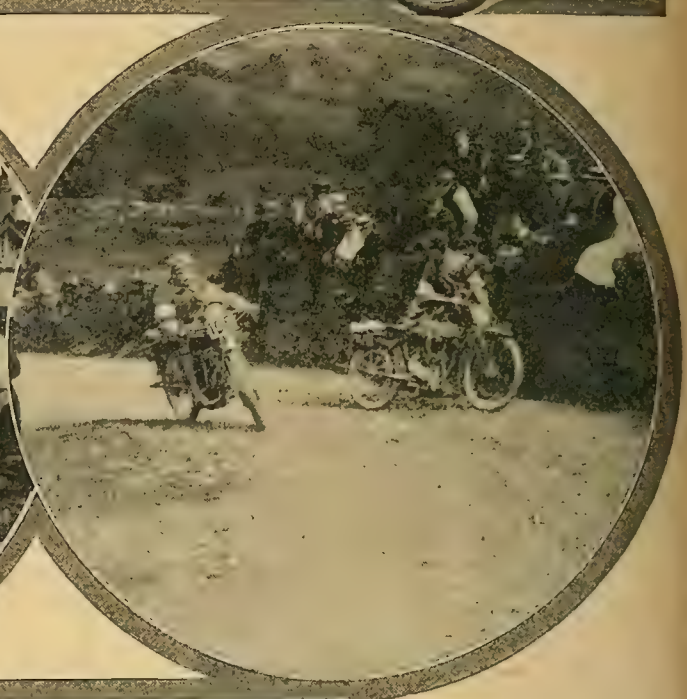
The growth of the Olympia Motor Cycle Show is phenomenal, particularly taking into consideration that only three of these exhibitions have been held. The organisation and conduct of the exhibition reflect the greatest credit on its promoters, the Motor Cycle Manufacturers' Union. Motor cycles and their accessories will again form the bulk of the exhibits, and, although most of the accessory firms cater for pedal cycles as well as motor cycles, there will be comparatively few complete pedal cycles shown; it is possible to run through the plan of the main hall and find only two or three firms who will exhibit pedal cycles only.

A suggestion recently made for a separate cycle car show has not borne fruit, and at this stage of the cycle car industry we do not think a separate exhibition for these machines would be at all successful either from a monetary or numerical point of view. This year's exhibits of cycle cars promise to be of the most interesting nature, as there are a large number of new models to be shown, which will come under the public view for the first time at Olympia.

It will be most interesting to see the trend of design in connection with motor cycle engines, as we know of several firms who are experimenting with multi-cylinder engines and two-strokes.

The springing question is also receiving some attention, and, in connection with sidecar combinations, it is most essential that the motor cycle should be fully sprung as well as the sidecar wheel.

INCIDENTS OF THE SIX DAYS TRIALS IN THE LAKE DISTRICT.



(1) A long line of competitors waiting for the flexibility test. In the foreground are R. E. Guest (8 h.p. Matchless sidecar), J. N. Longfield (Scott), and George Hunt (Campion).

(2) A trio of Douglas riders in Threlkeld.

(3) E. A. Colliver (7 h.p. Indian) on Gastack Beck. The rough state of the surface will be noted.

(4) J. V. Edge (Brough) and F. A. Applebee (Scott) rounding the hairpin on a severe gradient known as Sil er Hill, Keld.

The Clutches of Three-speed Hubs.

I was a little surprised by the warnings printed against using the clutch of a three-speed hub. My third three-speed hub has already reeled off a very creditable no-trouble mileage, and with all three test samples I have habitually used the clutch whenever I wanted it. I plead guilty to still finding the jump mount the quickest and least troublesome, but in spite of this my three clutches have all had plenty of work. I use them for all momentary stops, for turning round after overshooting a signpost, for handling the machine with the engine "dead," for coasting down long hills, and for starting against tiring grades, yet my hubs have never given me any trouble.

Starting on a Decompressor.

As I recently overheard several novices grumbling about the difficulty of starting up with the decompressor in action, I will venture to repeat the simple essentials which are familiar to every practised rider. To obtain a quick and certain start on a decompressor two things are necessary.

(1.) Flood the carburetter very freely.

(2.) Open the throttle much wider than is needed for a start on full compression.

Further, to prevent the engine baulking as soon as the rider is in the saddle (supposing the jump-mount is applied with the decompressor still in action, as would usually occur in the case of a machine fitted with a single gear and foot-operated decompressor), do not give any extra air until the decompressor has been put out of action. If these instructions are followed, a decompressor will be found to work with comfort and certainty until the engine compression becomes so poor that the engine cannot fire under any circumstances when the decompressor is in action. I am riding a three-speeder with decompressor, and I find the engine starts so easily on first or second gear that I seldom use the decompressor except for getting a start on the stand by pulling the back wheel round.

Hub and Countershaft Gears.

Perfection in this vale of tears is always in the nature of a compromise, and the admirable letter signed by Mr. Bowden on behalf of the Sturmey-Archer Gear, Ltd., ignores the fact that, though we are more than satisfied with his and other three-speed hubs, as gears, we are distinctly dissatisfied with their present location. It may be ideal from the gear manufacturer's point of view, it may even be nearly ideal in running: but, frankly, it is rather a nuisance when we want to change a tyre, and some of us, who are fastidious or fussy, imagine that it makes our back wheels much more bounceable and uncomfortable than they should be. Consequently there are thousands of us who are ready to accept the counter-shaft gear, with all its faults, real or alleged, if only we can get a moderate efficiency and durability, plus an accessible and light back wheel.

I should be specially interested to know if Mr. Bowden's experiments included the fitting of a counter-shaft Sturmey gear to a medium powered twin-cylinder machine, for to my mind the substitution of a twin (not exceeding 500 c.c. or 600 c.c.) just turns the balance in favour of the counter-shaft gear, young as its age is. I agree with Mr. Bowden in so far that I have not yet lost my heart to a 3½ h.p. machine with two-step drive and counter-shaft gear: but I add a corollary, that I am prepared to discard the 3½ h.p. single with hub gear in favour of a 2¾ to 5 h.p. twin with two-step drive and countershaft gear. Reading Mr. Bowden's letter, I should imagine that the experimental Sturmey-Archer counter-shaft gears were chiefly or exclusively tested on single-cylinder machines of 500 c.c. or thereabouts. My own similar test discouraged me enormously: but as soon as I repeated it with a twin-cylinder engine, the knell of the single-cylinder three-speeded hub machine was sounded in the sphere of my private judgment.

The Experimental in Cycle Cars.

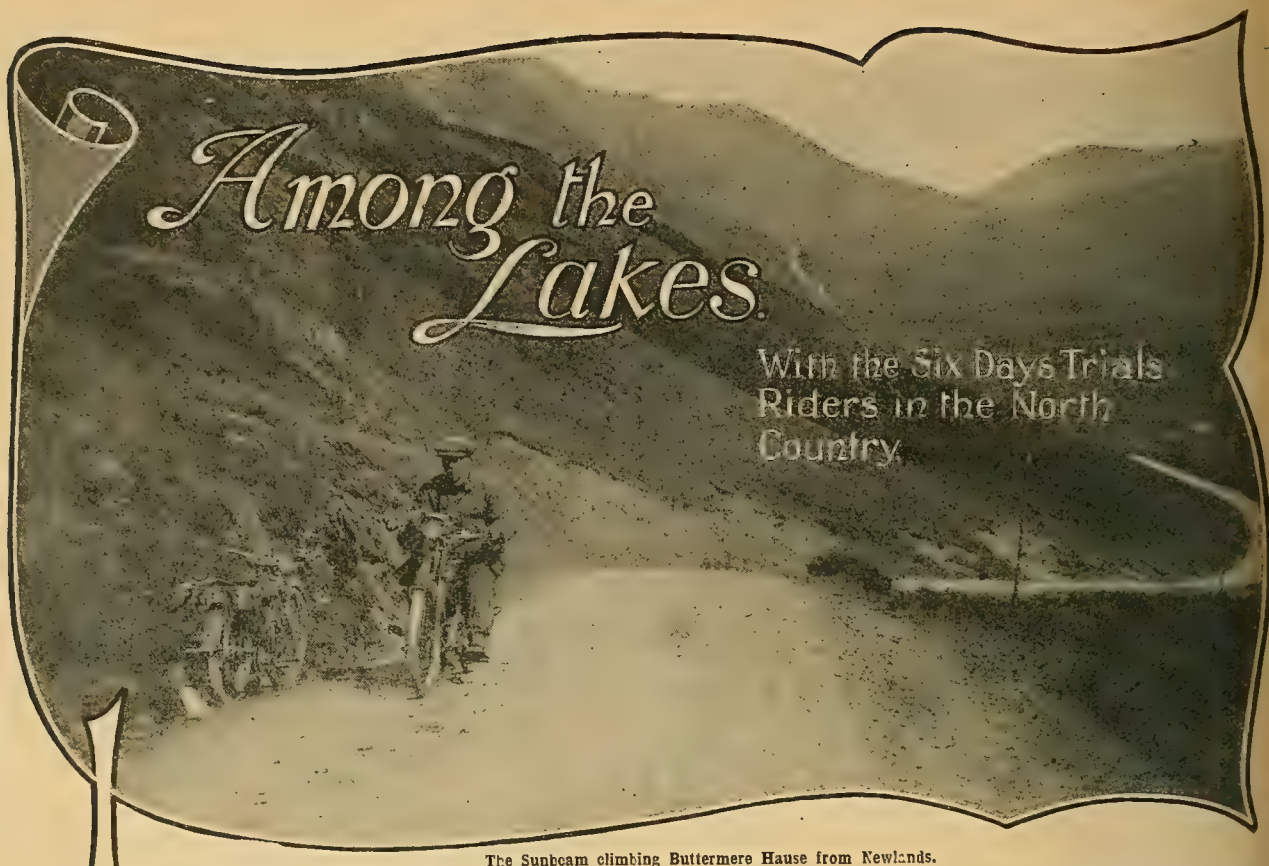
The Motor Cycle has never been afraid to reiterate the fact that, though a register of the different makes of cycle car may include over one hundred different names, yet a large number of these vehicles are purely experimental. In many cases, a name is only represented by one or two vehicles actually on the road, and the inventor is not prepared to accept—or at any rate to fulfil—orders. In other cases the eager designer is more cynical, and though he himself has only materials for the vaguest estimate of what his machine is worth, he is ready to supply by the hundred, supposing sufficient gullible fools come along. In a few—a very few—cases, the vehicle is sound from stem to stern, and the makers have their works thoroughly organised to supply a good article punctually.

We have often been reviled for our frank policy in this matter; but if there was anybody in whose eyes we needed some justification, the results of the A.C.U. Six Days' Trial bear us out most triumphantly. There is—admittedly—an immense market awaiting the first cheap and thoroughly efficient cycle car. If an inventor secured three gold medals with an entry of three machines, he would be absolutely certain of a busy season and large profits in 1914. Yet we find there are only twelve cycle car entries, representing ten makers. *Verb. sap.*

Personally, as one who was often "had" rather grievously in his salad days, I feel a certain resentment not only against the maker who tries to hoodwink the public into doing his experimenting for him, but also against those who in part create the impression that anything on wheels called a cycle car is, *ipso facto*, equal to the Rolls-Royce in everything except upkeep charges. Ninepence for fourpence is not to be had from any motor manufacturer!

Among the Lakes.

With the Six Days Trials Riders in the North Country.



The Sunbeam climbing Buttermere Hause from Newlands.

IT is a significant fact that, although honours in respect of chain *v.* belt are fairly evenly divided so far as *The Motor Cycle* staff is concerned, there seems to be an unconscious leaning towards the chain-driven single-cylinder type of mount for strenuous long-distance work. Thus it came about that we accepted the offer of Messrs. John Marston, Ltd., Wolverhampton, of a 2¾ h.p. Sunbeam as our hack during the now memorable A.C.U. Six Days Trials. It has been truthfully stated on more than one occasion that the journalist's lot in trials of this kind is far more difficult than the competitors', for he has to see practically all the main incidents in one place, then scurry ahead again to witness the performances of the vanguard, and after the day's run his time is usually fully occupied in writing, so that it is impossible to bestow any attention upon his motor cycle. A reliable machine, therefore, is a *sine qua non*.

We started away from Coventry on the Saturday preceding the trial, and were very quickly at home with our new mount. The position of the valve lifter on the right-hand grip certainly required some practice before we became accustomed to it, and in this connection we should like to point out that in our opinion it is high time the control of motor cycles was standardised. We, who, perforce, change from one machine to another, have first to become accustomed to carburetter levers opening inwards, others working outwards, brake levers on the left and right footrests, sometimes operated by a toe and sometimes by a heel pedal; valve lifters on left and right grips, clutch controls on handle-bar and footrest, until with such a medley one can hardly settle down with comfort to any one mount.

Impressions of the First Run.

Our Sunbeam was geared 6 and 12 to 1, in view of the tales of the severe climbing we were to expect in Lakeland, and the writer being in company with the rider of a 6 h.p. twin Brough on the trip to Carlisle, the pace, as may be imagined, was well up to standard. What impressed us more than anything else was the beautifully balanced engine and the absence of valve clatter. It has been our usual experience of single-cylindered machines that the handle grips are inclined to dither at speeds exceeding 30 m.p.h., but even with the chain drive of the Sunbeam there was a smoothness of running which must be experienced to be believed. Our run north *via* Stone, Knutsford, Warrington, to Preston by the R.A.C. avoiding route, and over Shap to Penrith and Carlisle was devoid of incident, and was accomplished throughout on top gear. *En passant*, neither of us was over-impressed by the R.A.C. route *via* Ormskirk. Twice we went off the route owing to the absence of direction posts, and finally decided that it was not worth the eleven miles extra distance entailed to avoid Wigan and the Lancashire cobble stones. A 240 miles trip in a day on an absolutely strange machine proves our confidence in the Sunbeam. The flexibility of the engine is a feature to be admired, for not only is it possible to crawl along in traffic with the engine just turning over, but it will "rev." at an extraordinary rate. As an instance of this, de la Hay in the mile speed test averaged forty-five miles an hour on a 6 to 1 gear;

Among the Lakes.

which gives a speed of 3,500 r.p.m. When it is remembered that the course was slightly uphill and heavy, owing to the drizzling rain, and that the test was on the last day of the trial, the significance of the demonstration of power maintenance is the more noteworthy. The course of the Six Days Trials has now been thoroughly discussed in these columns, and the consensus of opinion seems to be that, though the A.C.U. misled the competitors by stating that no abnormal surfaces or freak hills would be included, the fact that forty-six obtained gold medals proves that the test was not so bad as it has been painted. After all, with only five days and 750 miles to test the reliability and general excellence of the machines, the A.C.U. were bound to include tests out of the ordinary, or otherwise we should have had the absurd result of practically everybody obtaining the maximum award, which result would have neither benefited the industry as a whole nor the breed of machines in general.

The Tit-bit of the Trial.

Gastack Beck, between Dent and Ingleton, was, to the writer's mind, the test of the week. There was no such thing as a fluky ascent of this hill, which was nearly a mile long; had gradients of at least 1 in 4, and was covered with loose stones. A motor cycle which can successfully account for a hill such as this must be of the first water, though, admittedly, failure in some instances may have been due to bad luck. Our plucky little Sunbeam successfully scaled this hill as well as every other hill we attempted during the trial, but had it not been for the splendid plate clutch with which the machine is provided, success would not have been ours. Twice the machine slowed down on the steepest gradients until within a few yards the engine would have stopped, and as a last resource we eased the clutch slightly, and were amazed to find that one could hold it half engaged without there being the slightest tendency for it suddenly to grip, which is the usual procedure of clutches which are designed on the small side. We have never had a more striking demonstration of the efficiency of a large size plate clutch, or of the desirability for handle-bar control. On the loose surfaces it was necessary to put down one's feet from time to time to correct a skid, so that the successful operation of a pedal clutch was out of the question. Nenthead, Tan Hill, Butter Tubs Pass, Kirkstone Pass, and Silver Hill, Keld, among others, the Sunbeam revelled in, and Crossdale Hill, near Cockermouth, which a disillusioned yokel suggested

THE SIX DAYS TRIALS.

(1) V. Garland (8 h.p. Chater-Lea sidecar) followed by R. Pearson (Clyno sidecar) on Buttermere Hause. (2) E. A. Colliver (Indian) and D. Alexander (Williamson sidecar) on Watermillock. (3) H. Ball (Triumph) and F. Crosthwaite (8 h.p. Matchless sidecar) climbing Higher Lath near Ulverston.

Among the Lakes.—

to us was one of the worst hills in the whole trial, the Sunbeam easily climbed with *The Motor Cycle* photographer on the carrier. On the Wednesday of the trial, up to which point nothing had required attention, we climbed both sides of Buttermere Hause, the ascent from Newlands being the steeper. The stability of the Sunbeam left nothing to be desired.

On the Thursday and Friday of the trials, when the rain made the conditions so uncomfortable, the same average speed had to be maintained, and, as before mentioned, it was necessary for us to beat the average of the competitors, in order to see the main points of interest during the trial. By this time the exhaust caps and pipe of the Sunbeam had assumed a purple hue, but there was still no sign of falling off in power, and we continued to take single figure gradients with the certainty of a clock.

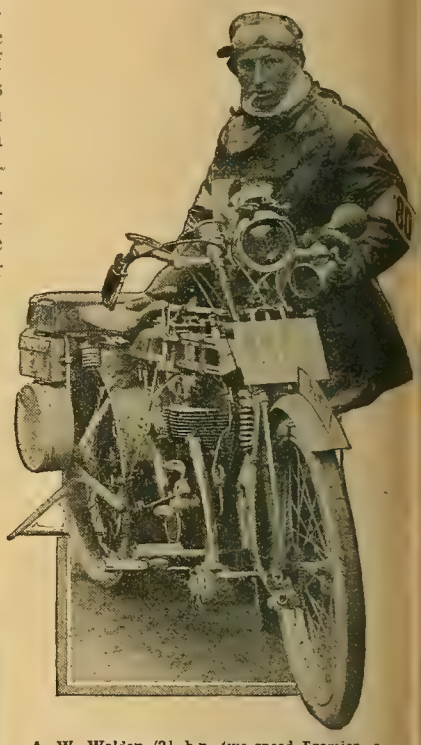
Only One Adjustment Necessary.

Only one adjustment did we deem necessary during the strenuous week's work, and that was to take up the slackness of the rear chain, which is easily accomplished by the special studs provided. This occasion was, in fact, the only one on which we inspected the toolbag, and we were interested to observe that the machine had been sent out equipped in the most thorough manner. It is a peculiar coincidence, of which we have taken due note on several occasions, that the most reliable machines which we are asked to test are usually those provided with the most complete repair outfit and spare parts.

On the Homeward Road.

The homeward run to the Midlands was again accomplished in a day, despite the fact that it rained practically all through the journey. At the conclusion of the test we were interested to observe that one could stand on the foot starter against compression for an indefinite length of time, proving that the Sunbeam engine is not only efficient and reliable, but one that will maintain its power for long periods. A peculiarity is a slight ring in the cylinder, due to the thin radiating fins.

The machine generally had stood up to its work perfectly. The brakes were as powerful as ever, and not a nut was loose. Oil certainly had oozed from the exhaust valve tappet, but not in sufficient quantities to cause a mess. If we were asked to suggest an improvement, it would be in connection with the number of speeds. It is true that a machine which suits Lake District requirements may not be ideal for the majority of other roads, but in hilly districts especially one notices the absence of a middle ratio on two-speed machines. For instance, when climbing the moorland hills during the Six Days Trials there were many cases when the combination of a head wind and rising gradient proved too much for the top gear of two-speeders, yet on the low gear the engines were running unnecessarily fast. An intermediate ratio would have exactly filled the bill and saved the little engine much needless labour. G.S



A. W. Walden (3½ h.p. two-speed Premier, a gold medal winner in the A.C.U. Trials.

J. Drysdale (5-6 h.p. Hazlewood) and Jesse Baker (3½ h.p. Scott) climbing Watermillock Hause, a long climb over a stony surface.

AMONG THE ACCESSORIES.

B.K. Accessories.

Messrs. Bransom, Kent, and Company, Limited, 40, Great Eastern Street, E.C., have lately introduced a good many interesting accessories. One, for example, known as the "Glad Eye" cushion, designed to fit on the back carrier of a

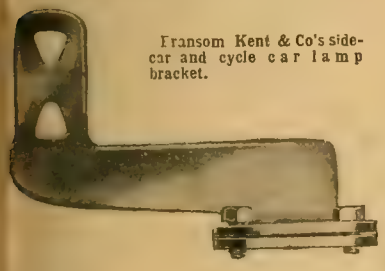
B.K. leather and canvas belt.

motor cycle; similar to this is the "Glad Eye" seat, which is a basket seat designed to be fitted in the same position. Quite a novelty introduced by this firm is a leather belt, which we illustrate herewith. The chief feature is the length of canvas (two plies) running between the leather. It will be noticed that the belt is supplied with eyelets, so that no boring is necessary.

A cleaning brush should be very useful to those riders who look after their own machines. Combined with it is a smaller brush, which fits into the handle, for cleaning between the chain links.

B.K. dashboard clock for cycle cars.

We also inspected an excellent motor cycle watch for fitting on the handlebar. The face is inverted and the back of the case is provided with slots which allow the face to be set square, even when the clip is fixed on to a curve in the

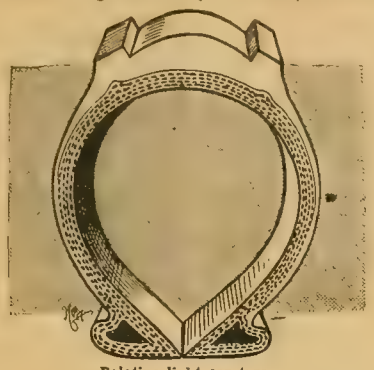


Fransom Kent & Co's sidecar and cycle car lamp bracket.

handle-bar. The cycle car clock illustrated is another useful accessory. The lamp bracket shown herewith is designed specially for sidecars and cycle cars. It is made in several forms for attaching to the bodywork, or for fastening to the sidecar tube by means of a U bolt, or on to the springs of the sidecar.

A Light Car Tyre.

Messrs. The Palatine Tyre Company, Saul Street, Preston, have recently introduced a light car tyre for cycle cars,



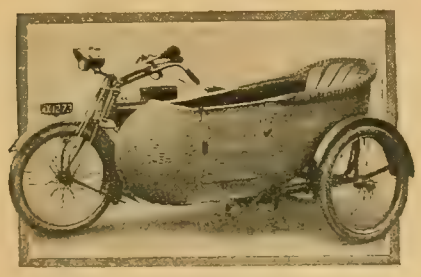
Palatine light car tyre.

following the lines of the successful motor cycle tyre which made its *début* at the beginning of the season with a severe A.C.U. test, through which it came most successfully. It is illustrated herewith.

The Lomax carrier tool case.

Maude's Latest Sidecar.

Messrs. Maude's Motor Mart, 136, Great Portland Street, W., have brought out a new pattern cane sidecar for which great comfort, combined with lightness



A new design wicker sidecar by Maude's Motor Mart.

and strength, is claimed. Spring cushions for the seat and back are fitted. A 26in. × 2¼in. Continental tyre is supplied on a flat type rim, and 5in. shackles are utilised in the springing. The whole sidecar is most roomy and built on strong lines, and the price complete is thirteen guineas.

"The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates:—Unmounted prints, half plate 1/6 post free; mounted, 1/9 post free. This refers to photographs taken by "THE MOTOR CYCLE."

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.

The "Midmore" Saddle.

The latest type motor cycle saddle which we have had the pleasure of using is the "Midmore," a padded-top saddle just placed on the market by Middlemore and Lamplugh, Ltd., Coventry. The saddle top is moulded and shaped to fit over a pressed steel plate which is shaped to accommodate itself to the rider's form. Between the leather and steel is a soft padding of felt, the combination making a very comfortable seat. The patented construction lies in the direction of the springing, which is quite novel. Attached to the rear of the steel plate

Latest pattern Middlemore saddle.

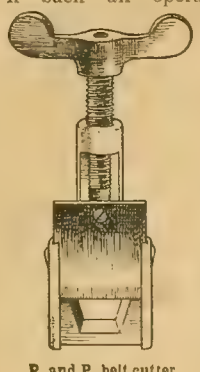
are two C springs made of flat steel, these springs being fastened at their base to tension coil springs depending from the rear extremities of the frame. The tension coil springs take the weight of the rider, and the C springs act as compensating springs. The action of the C springs is wonderfully easy, and we have found this saddle one of the most comfortable we have tried. There are no springs in front; the nose of the saddle is hinged to the front part of the frame and oscillates about this centre. The weight of the Midmore is 5¾ lbs., and the price is very reasonable.

An Unstretchable Belt.

We have received a belt for inspection which is interesting in that an attempt has been made to convert an ordinary belt into one of the unstretchable type. The feature consists of a length of flat

Allen's Patent unstretchable belt.

spring steel extending from one fastener to the other, and held in position by light wire staples. Holes are punched in the strip at short intervals near the end so as to facilitate shortening if such an operation should become necessary. The maker is Mr. A. H. Allen, Panmure, Victoria Road, Cirencester.



P. and P. belt cutter.

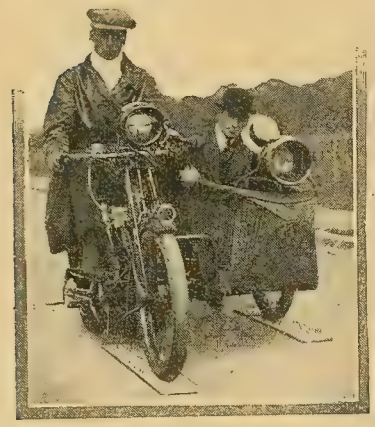
A Belt Cutter.

Messrs. Packer and Prentis, engineers and manufacturers, Roden Street, Ilford, E., have lately introduced a very neat and well made belt cutter, made, in the form of a guillotine, which cuts truly and cleanly

A Puncture-sealing Demonstration.

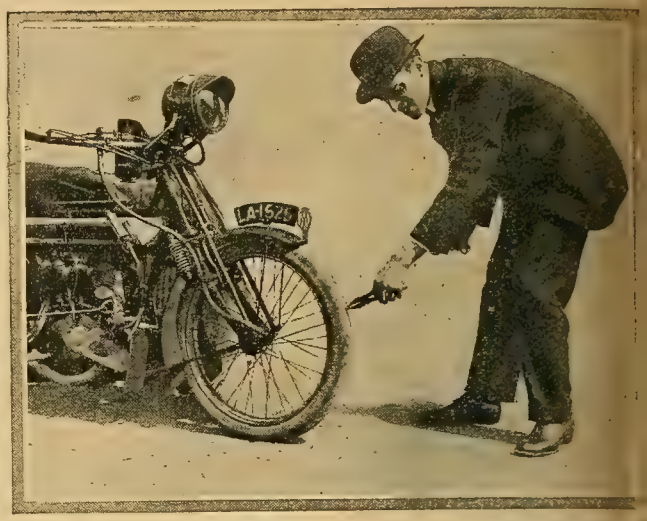
LAST week we were invited to witness a demonstration of the preparation called Puncture-Seal, which has been introduced by Puncture-Seal, Ltd., of Elden Street, Hampstead Road, N.W., to minimise the troubles arising from tyre punctures. The composition is a secret one, and is put up in collapsible tubes, but we understand that 50% of it is pure rubber. It is almost odourless and is non-inflammable, and can be washed off the hands with soap and water. Its application is as follows: A collapsible tube of the mixture is screwed to the valve of the air tube, from which all air has been expelled, the collapsible tube is squeezed, and the mixture forced into the air tube. The air tube, after fitting and inflation, is then used in the ordinary manner, and during the running the ingredients of Puncture-Seal receive their final mixing.

When a puncture occurs the pressure in the air tube will force the Puncture-Seal into the hole, where it sets like rubber. The mixture is always ready to fill a hole, because the centrifugal action of the revolving wheel keeps a layer of it on the inside of the tube next the tread.



The 6 h.p. three-speed Trump-Jap being driven over the nail covered planks to test a new puncture seal.

The demonstration we witnessed took the form of extreme ill-treatment of the tyres on a Trump motor cycle and sidecar driven by Mr. Cass, of Cass's Motor Mart. Two planks about 4ft. long were each studded with eighty-eight wire nails and laid along the road; meanwhile three wire nails 1¼in. long had been driven into each of the three tyres of the combination, which was deliberately driven over the planks, the nails of course penetrating the tubes, for they projected above the boards for about one inch.



Drawing nails from the tyres of the machine on which the test was made.

After the combination had been driven over the nail and had also been stopped and started thereon, some the nails previously hammered in were withdrawn from t tyres. Throughout the demonstration, no loss of pressu was experienced.

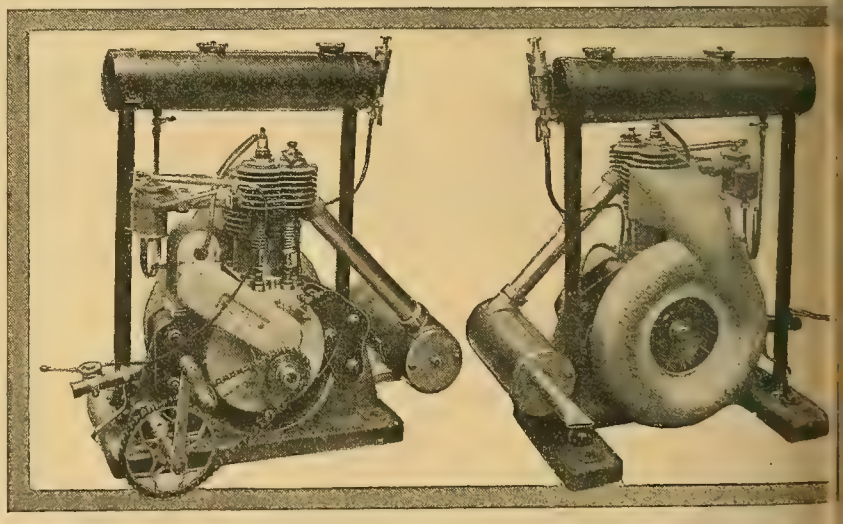
The makers of Puncture-Seal will guarantee air tub against puncture for three years if their preparation properly applied, but, of course, do not guarantee agai bad cuts or bursts, but they inform us that on one occasi a cut in a tube 1¼in. long was stopped.

Ordinary methods of vulcanisation are said not to affected by this composition, and should a cut or burst quire patching and vulcanising, the Puncture-Seal which oozed out can be removed by the aid of water, which m not be allowed to enter the tube.

It is claimed that the composition prolongs the life of t rubber and cures porous air tubes.

A 5 H.P. STAG ENGINE WITH NOVEL COOLING DEVICE.

We recently had an opportunity of examining the 5 h.p. Stag cycle car engine (bore and stroke 80 × 120 mm.), which is now at the Service Co.'s Depot. The engine is particularly well-made, the castings being clean and neat, and there is an absence of dust-collecting recesses. The timing is effected by means of a single cam of large dimensions, operating roller rockers of special design, so that both valves close sharply, thus doing away with the necessity of extremely strong springs. The valve springs are of large diameter and are brought well away from the engine so that they may be easily cooled. The valves are made of 3% nickel steel. The cylinder ports are of large area both above and below the valve. The cooling arrangement is most interesting. An outside flywheel has vanes cast on it, and is enclosed in an aluminium casing, thus acting as a high speed blower. The current of air produced by the flywheel fan is led through a large channel, and impinges upon the cylinder head round the valve ports. The main shaft is supported on ball bearings, the outside flywheel end of the shaft being provided with a double row. Inside flywheels have also been retained.



(1) Valve side of the Stag engine which is made at Nottingham. The engine is rated at 5-6 h.p. and designed for cycle car work. (2) The same engine showing the mechanical blower which directs a curre of air on to the cylinder head.

THE FREAK HILL POLICY.

By "ROAD RIDER."

LAMENTABLE as it may seem to have been, I for one am not altogether sorry that the path-finders of the Auto Cycle Union received some-ng of a snub in the Carlisle week. This remark is ely devoid of personalities. The gentlemen con-ned in the selection of the route which occasioned h sensational friction were merely the logical ponents of a policy which has been far too popular h the organisers of competitions during the last o years. The introduction of three-speed gears, ording emergency ratios as low as 15 to 1 if neces-y, has rendered a first class motor bicycle capable jeering at all the hills which any sane man would sh to climb. It has also put club secretaries in a tty hole. Split second timing is practically the sole ernative factor by which weaklings can be eliminated ler the present *régime*. A trial organiser does not sh his event to be reduced to the farcical level of Caucus race hymned by Lewis Carroll, in which erybody wins and everybody receives prizes. If he l, the treasurer would object furiously, since the gest practicable entry fee does not leave enough rgin for all the entrants to take home cups or dals: and, finally, the riders themselves, even the tradiest" of them, have sufficient sportmanship to fer a task with some difficulty in it. So our short-ghted organisers fancied they were in a cleft stick tween the most niggling split second timing and the ak hill policy.

The Baulking Difficulty.

The bigwigs of the A.C.U. were a little nervous st they had outstripped prudence with their Carlisle urse: and therefore they carefully announced that e path-finding party had made clean ascents of all e worst freak precipices, and that with quite rational ars—Brooklands gears, indeed, one might say with spice of exaggeration. They forgot in their uberance that it is one thing for a trio of light-arted holiday tourists to romp up a freak hill: but nite another for eight score machines, including many ide, slow passenger outfits, and a sprinkling of dacious fools, to tackle the same hill in a string, ssibly on a wet day, with the surface ploughed up kle-deep, with practically permanent baulking (I yself was baulked on all twelve test hills in a trial ith a smaller entry some years ago), and with the rain of knowing that the gold medal depends on ch twitch of the carburetter levers or the handle-ar. In other words, these freak hills do not provide genuinely fair and scientific test of the machine. hey are a magnificent lottery: and lotteries are right t of place in an event which may spell success or ilure to a manufacturer at the critical stage of his ublicity campaign, and which is, *par excellence*, tended to be the real "form-exposer" of the year r the buying public. If the Carlisle *débacle* sounds he knell of the "freak hill policy," so much the etter.

It is easy to be a destructive critic, and the world eeds constructive critics. I am strongly inclined to ecommend a combination policy. If adherence to ell-known main road hills (*e.g.*, Sunrising and Bird-ip, *et hoc genus omne*) were combined with a rigid ear ratio minimum, we should obtain a better flexibility test than the brief episode designed to try that factor in this year's trials: should practically eliminate the lottery factor, because baulking can easily be prevented on broader hills of good surface, and the trade would secure a greater advertisement, because an out-of-the-way hill can never command so huge a crowd of spectators as a main road gradient.

My Point of View.

In strongly commending this policy to the organisers of future trials, I write from the dual standpoint of a sportsman and an experienced trials competitor. I have won many gold medals under the "freak hill policy," which I condemn. The winning of those medals was largely a matter of good fortune. I was wiser than many of my fellow competitors. I was always careful so to arrange matters that I did not essay the ascent of a twisty, narrow, rockstrewn by-lane in the thick of the crowd, or with two or three passenger machines or bad drivers of solo mounts immediately ahead. I adopted gears too low for the occasion, and I changed down to my lowest ratio as soon as the surface became alarming. Even so, the gold medal on a dozen occasions hung round my neck by a thread. Over and over again, it was a question of inches and shrieks as to whether I was shut in or not, and an infinitesimal error in the adjustment of carburetter or ignition levers would have spelt failure. Failure did not particularly matter to me, riding as an irresponsible amateur for my own amusement. But I was inspired with a deep sympathy alike for the unfortunate trade rider, whose very bread and butter may depend on success, and for the budding manufacturer, whose capital is insufficient to wait another twelve months for the customers his goods may deserve. Therefore *à bas* with the "freak hill policy" so far as the big annual trials are concerned.

THE SIX DAYS' TRIALS IN LAKELAND.

W. R. Steel (2¾ h.p. Sunbeam) ascending Crossdale Hill. It was on this twisty rise that the Sunbeam we were riding took a passenger up on the carrier.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Caps for Motor Cyclists.

Sir,—I see that your well-known contributor, "Ixion," is in search of a cap for motor cycling in May I suggest the following, which I have found very practical: Remove the peak off a cap and sew it on to another whole cap so as to overlap the latter's peak and thereby provide a peak some six inches or so in length. I think "Ixion" will find that the above is a cure for keeping rain off goggles and glasses. One generally has an old cap handy, or perhaps one may find a friend's cap doing nothing!

G. G. C. PIGOTT.

The Fosseway.

Sir,—In your article on the Fosseway in *The Motor Cycle* for August 21st, the writer, in commenting upon the absence of villages along this road, says, "Moral: Don't run out of petrol." This would convey to your readers the impression that petrol cannot be obtained along this stretch of road, but this is not the case. Motor cyclists can always rely upon getting a supply of petrol, oil, carbide, etc., at the Durham Ox Inn, Six Hills. This inn is on the Fosseway at the junction of the Melton Mowbray and Loughborough roads, about ten and a half miles from Leicester along the Fosseway. L. B. SADLER.

Dispensing with a Differential.

Sir,—Mr. Walford, in his article "Dispensing with the Differential Gear," tells us that "for the most part one of two alternatives is adopted. In the one case, one wheel alone is driven, whilst in the other the axle transmits its torque to both road wheels through over-running clutches."

The first alternative is, of course, quite common, but I have never heard of over-running clutches or free wheels being used in connection with the modern cycle car, although I believe they were used in the early days of motor cars.

The third construction (a solid axle with both wheels driven) is also well-known, but the automatic clutch gear will, I think, be new to most of your readers. Would Mr. Walford tell us what cycle car is, or has ever been, fitted with this gear, as I am rather interested in it?

The last alternative (belt drive) is, of course, nothing new.

ROBERT D. DUNLOP.

Driving from the Sidecar.

Sir,—For four months of the year, in this part of India (Central Provinces) at least, the motor cycle and sidecar has the advantage of its more expensive congener. The rivers are now very much in evidence, and many of them are only bridged by railways, so that owners of cars while travelling have constantly to send their motors by train This is a troublesome and expensive business. The sidecar owner, however, has merely to detach the sidecar, and it goes comfortably into the brake van. I have lately taken to riding solo in the sidecar. It does not take long to get the knack of slipping into the sidecar when under weigh. I find a decompressor useful in descending hills as the clutch (Triumph) is not accessible from the sidecar. While throttling down hill with the decompressor in action it is difficult to tell whether the engine is firing or not, and with the throttle nearly closed and air lever wide open a very good braking effect is obtainable. Both brakes are within reach of the sidecar

I wonder manufacturers do not lay themeselves out more for middle-aged persons like myself. I find the bicycle saddle irksome in the extreme. Why cannot I have an upholstered cane chair to sit in attached to Cee springs connected to the back forks. This, together with a split metal apron, the end of which could be made detachable from the ends of the foot boards with flynuts, would enable the driver to go out to dinner in comfort in torrents of rain.

Central Provinces, India. F. TRAFFORD.

Flexibility.

Sir,—I have noticed several letters on flexibility in your paper, and should like to add a word or two to the subject.

I agree with one of your correspondents that an automatic carburetter is the chief secret. My old machine was a 2 h.p., and was fitted with one of the best makes of two lever carburetters, but it was very difficult to run slowly in traffic or to get sudden acceleration. I now have a 4 h.p. single cylinder, and have fitted it with a Binks carburetter, and to drive it is a pleasure. It is possible on the pilot jet to crawl in traffic, or even turn round in an ordinary road with the engine running, and yet the throttle can be opened quickly for a sudden burst of speed without the old bugbear of choking, as with the two lever type.

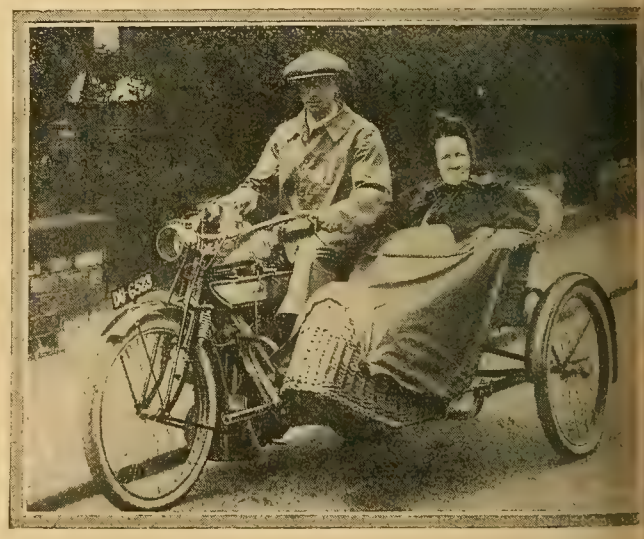
I imagine a twin would be still more flexible, especially if fitted with three speeds. My machine is only a single-speed which makes it a still more unfavourable subject for flexibility trials.

The Binks carburetter does just what Mr. Binks claims for it. I have no interest in his firm, but I am grateful to him for having produced a carburetter which makes driving such a comfort, and I will never be without an automatic carburetter of some sort again. WILFRID M. BEAR.

An Aged Passenger.

Sir,—I enclose a photograph which may be of interest to you, showing how some York young ladies enjoy sidecarring.

JOHN R. M. ANKERS.



An old lady of 91 enjoying a sidecar trip.

Rules for Reliability Trials.

Sir,—Early in the present season you commented upon the rules which were drawn up for one of this club's competitions, the points to which you directed attention being two conditions which were suggested by Messrs. Crow Bros. for the trial held on April 30th for a trophy presented by them. The two rules were as follows:

1. No solo machine exceeding 350 c.c. shall use a gear ratio lower than 8½ to 1.

2. No machine exceeding 600 c.c. shall be driven as a solo machine.

This matter is recalled to memory by looking through the list of entries for the big trade competitions of the last few weeks, in which it will be found that riders of 2¾ and of 8 h.p. solo machines appear to compete on a basis of equality so far as regards the performance expected of them, though it must be obvious that no one can fairly ask the smaller machine to do as much as the larger. The unfairness is further increased when no limitation of gear ratios is imposed.

In order to reduce this inequality, some steps should be taken to place the machines more nearly on a level footing, and I would suggest that it would be worth while to try the effect of enforcing at least the second of the above rules in future competitions.

Perhaps, sir, if you have noticed an alternative proposal of greater promise than the above you will give the matter publication so that it may receive the attention of club officials before we are started on a fresh season of competitions. CYRIL J. FEENY, Hon. Sec. Surrey M.C.C.

The Position of Three-wheeled Cycle Cars.

Sir,—We should be the last to find fault with the decision of the A.C.U. (following the A.C. of France) that three-wheeled cycle cars shall compete on equal terms with sidecars. We have always maintained that it is essential to the success of the cycle car that it shall prove itself the equal of all other light passenger vehicles. Nor do we complain that the three-wheeler is severely handicapped in comparison with the four-wheeler. We take it as a compliment (not wholly undeserved) that in the Six Days' Trials the three-wheeler was required to obtain 5% more marks in order to obtain the premier award for reliability, and also to show itself 7% more speedy, with 9% less engine power, in the speed trial.

But the method then adopted of classing the three-wheeled cycle cars with the sidecars, leaving the four-wheelers in a separate class, gave rise to some confusion and, perhaps, a little unintentional injustice. It is true that "Class II." was defined as "for sidecars and three-wheeled cycle cars," and most people know that the Morgan and the Wall are cycle cars. But, apparently, all had not that knowledge. *The Standard*, for example, wrote of "the only two surviving cycle cars, the G.W.K. and the J.B.S.," whereas the Morgan not only survived but qualified for a gold medal. The same mistake was made by some of the less well informed newspapers in regard to the Grand Prix. Would it not be more convenient if, in future, there should be one class of passenger machines only, which, for handicapping, could be divided into three categories—sidecars, three-wheeled cycle cars, and four-wheeled cycle cars? If special prizes were given they should be given to the whole class, at any rate not to three-wheelers and four-wheelers separately. MORGAN MOTOR CO.

Power for Sidecar Machine.

Sir,—In your 14th ult. issue I notice that on page 1055 Charles D. Wright suggests that there must be many who would like to know what a 3½ h.p. machine with sidecar can do in ordinary hands.

I am one of the "ordinary hands," and drive a Bradbury with sidecar. I always carry twenty-seven stone, which includes myself, passenger, and luggage. I have travelled all over North Wales, Staffordshire, and Derbyshire, and can go up any of the hills easily, and it is only very occasionally that I get any knocking, and this is generally when turning round a sharp corner. My machine has Sturmey-Archer three-speed hub gear. I get seventy to eighty miles out of one gallon of petrol. I have never had any trouble with the machine, although I travel on the average about 700 miles per month.

I learnt to drive on a fixed gear machine with sidecar (5 to 1), and the result was that I learnt how to get the best out of a machine, and even with this fixed gear machine there were only a few hills where the passenger had to get out.

FOOLSTEP OR FULLSTOP? H. E. Ashley (4 h.p. L.M.C.), C. E. Murphy (2¾ h.p. Douglas), and W. Chater-Lea (8 h.p. Chater-Lea cycle car) between the double bends on Foolstep Hill—affectionately known to the competitors as "Fullstop."

I consider that if a beginner was to start like I did, with a fixed gear, he would get a much better idea how to drive a machine than if he were to start with a machine with three-speed gear.

In conclusion I might say that, although a higher power machine may give a bigger speed on the level, for an "ordinary hand" there is nothing to equal a single 3½ h.p. machine for reliability and steady running.

I have no connection with the Bradbury Co., and only write what I have found out from my own experience.

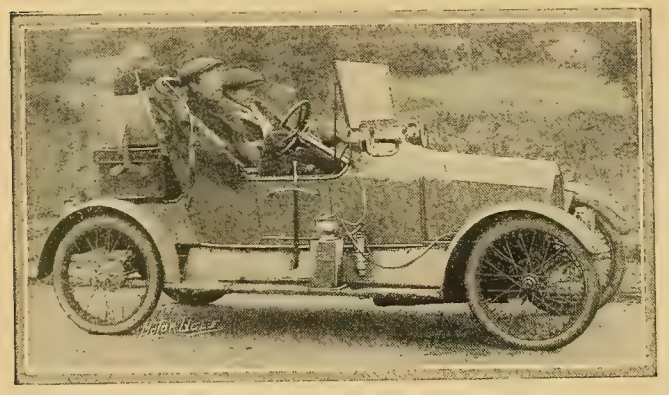
A. W. WALBURN.

A Cycle Car Camping Tour in Lakeland.

Sir,—You may be interested to hear of a tour through Lakeland I undertook recently on my Humberette, when I spent my annual holiday under canvas with my brother on the shores of Haweswater.

Besides our personal luggage and usual long distance motor spares the machine was loaded with tent for two, bedding, and utensils necessary for a camping holiday.

In spite of this heavy additional load (quite equal in weight to an extra passenger) the Humberette made light of all the hills and covered the total distance of 893 miles during the ten days we were away without a mechanical stop, save to clean an oily plug; and although driving on



A Humberette owner on tour (see letter from H. Bunce).

the original tyres supplied with the machine last December, which already have three or four thousand miles to their credit, we returned without even a puncture. I may say in this connection that I find the Humberette very light on tyres; in fact I have only had one puncture since I had the machine, due to a nail picked up on the wood pavement.

We did about 200 miles in the Lake District itself, and on the return journey climbed Kirkstone Pass from the Ullswater side, a sufficiently severe test, in my opinion, to convince any who may entertain doubts as to the practicability of air-cooling on this type of machine. The major portion of the run was done on petrol, and consumption averaged 40 m.p.g. When at home I always run on benzole, which gives rather more power than petrol and about 48 m.p.g.

HERBERT BUNCE.

Hub and Counter-shaft Gears.

Sir,—Last year I bought a 1912 machine with a three-speed back hub gear. Besides being very careful in following the instructions as to the gears, I always lifted the exhaust valve while changing gears, but after I had done six hundred miles trouble began in earnest. After about sixty or seventy miles' ride I always had to adjust the gear, although I had it done up as tight as it would possibly go. I had to have it taken to pieces ten times, and on four of these occasions the whole back wheel had to go to the makers of the gears, and three times the makers of the gears mended it free of charge. But the charges for taking the wheel down and sending it away by rail came to over £9. All this was done before I had the bicycle six months and before I had done 2,000 miles on it. It also kept me for weeks from the use of my machine.

Now in May this year I bought a 1913 Douglas, and have already done 3,400 miles on it without any trouble whatever with my counter-shaft gear. The only thing I do to it is to give it three pumpfuls of oil every 150 miles and to put graphite on my chain. My chain is open to all the dirt and dust of the road, but after 3,400 miles I find no signs of wear to speak of.

Also this year I have met nine persons on the road trying to make their hub gears work properly, and I have never found one person on the road who has broken down with his counter-shaft gear. I think there is no doubt whatever which of the two kinds is better.

LL. K. JONES.

Sir,—I was interested in Mr. Bowden's letter in your issue of August 14th, criticising the counter-shaft drive as compared to the direct belt drive with hub gear, in which he makes some rather alarming statements about chain drive.

I have driven a 3½ h.p. Indian for the past year, covering close on 5,000 miles in all weathers, and have had practically no trouble with the short engine chain to counter-shaft. I replaced this after 4,000 miles, as I found two rollers broken, but the chain is far from worn out, and will probably run a good distance further after being repaired. The drive is no fiercer than that of a belt, and as regards tyre wear I still have the original tyres on (Hutchinson's), which is fairly creditable, as steam-rollered roads are rather a luxury in Ireland, and a good distance has been covered with passenger on the carrier or sidecar. The machine is noticeably free from vibration; this may be put down to the excellent Indian clutch.

I owned a belt-driven machine (a Triumph) before the Indian—the less said of belts (in my experience) the better.

It may not be out of place, in view of the many objections raised against automatic carburetters, to put in a word for the Indian with pilot jet. I have found this very satisfactory, giving good acceleration and any speed from about 5 to 50 m.p.h. with reasonable economy (100 m.p.g.). I tried another widely advertised pilot jet carburetter, but found it was not in the same street as the Indian either as regards slow running, climbing, or speed. I have no interest whatever in the Hendee Co., except a profound regard for them as the makers of a really serviceable motor cycle.

W. T. MALCOLMSON.

Sir,—On reading through your two previous issues I note several comments with respect to the chain counter-shaft drive, and should like to bring my experience before your readers.

I am a commercial traveller, and, as you can imagine, come in contact with all kinds of roads both as regards surface and hills, in various kinds of weather, as I have to get over the ground wet or fine, and think my machine has done wonderfully well under the circumstances.

The mount is a 1913 3½ h.p. James three-speed, counter-shaft, with chain drive throughout, and I have covered upwards of 5,000 miles without ever having touched the counter-shaft chain, and only adjusted the driving chain on three occasions, which is only a few minutes' work—which, I think, will prove Mr. Bowden's theory of a counter-shaft chain only having a life of about 1,500 miles very absurd—and am still riding the original tyres.

I may add that I have no interest whatever in the James Co., and that my reason for writing these few lines is to show the great advantage, to my way of thinking, of the chain drive over the belt with hub gears.

G. R. ARMES.

Sir,—After reading the letter by "AN 1231" in your issue of 14th August, I feel that I cannot allow it to pass without comment, more especially his statement that "hub gears may be all right for lightweights but will not stand the healthy kick of a 3½ h.p." Allow me to give an account of my experiences with a hub gear.

In March last I had an Armstrong three-speed hub fitted to an 8 h.p. twin Matchless, and since then have covered about 3,000 miles, and at least 2,000 with a heavy coach-built sidecar fitted with a wind screen. In that distance I have never had one moment's gear trouble. The clutch has never slipped, the gears have never failed to change, and, above all, have never made any noise when changing. But in case "AN 1231" should think that my machine does not possess a "healthy kick," allow me to specify at least one of my journeys. In the Airdrie and Coatbridge District Club's reliability trial I was asked at the last minute to take the press representative as my passenger. The route

was 160 miles of rough highland road, including an ascent of Amulree. My machine was the only one to make a clean ascent of that hill. I gained the special prize for the best performance in the passenger class.

Again, in the same club's flexibility hill-climb I used my middle gear in both fast and slow ascents, the times being 44⅘s. and 2m. 53s. respectively. In the fast climb I had the full power of my engine turned on, except at the bad bends, and still no trouble with clutch slip. Surely this was a severe enough test to find any weakness in the gear.

In conclusion, I may state that I use my machine for business purposes, and have, on an average, forty stops per day, and I use the clutch to start after each. I do not oil the gear more than once every 200 miles, and then only sparingly. I have nothing but praise for the three-speed hub, especially the Armstrong, which certainly, in my case, has given greater satisfaction than I even expected. I need only add that I have no connection with the Armstrong gear company or with any cycle manufacturer or agent whatever. BENJ. W. BOYLE.

Sir,—Surely it is quite time that your readers looked at facts instead of fancies, and calmly considered performances instead of prejudices. We do not believe that there has been any other part of a machine so unmercifully criticised and so unfairly commented upon as the three-speed hub gear.

When this company first introduced its three-speed motor gear, the press took the thing very coldly, and advised people to stick to the single gear machine rather than take the risk of a complicated piece of mechanism. The great success we had in the T.T. Race, 1911, gave the motor cycle gear movement a great impetus, and the press then began the controversy that, if gears were necessary, counter-shaft gears were preferable to the hub type.

For three years the press has misguided people, and has rejoiced at any instance of a hub gear giving trouble. We know of one case in which a press man, entirely through misadjustment of the gear, complained of clutch slipping and hailed this with positive delight as proving the many unkind things he had written regarding hub gears.

Actions speak plainer than words, and, taking the whole of the strenuous competitions, hub gears have performed magnificently. In the T.T. Race this year six machines out of the first twelve in both junior and senior events were fitted with hub gears. In the Scottish Six Days Trials hub gears scored in a most decisive way, while, in the English Six Days Trials, just held in the Lake District, machines with hub gears put up a phenomenal performance. Ye gods, look at these figures!

500 c.c. Class.

	Machines entered.	Gold medals awarded.
Fitted with hub gears ...	27 ...	17, or 63% of entrants
Fitted with other gears (not hub type) ...	... 33 ...	6, or 18% of entrants

Surely, in face of these figures, it is time to cry a halt in the destructive criticisms that have been levelled against the three-speed hub gear.

Fortunately, the demand for hub gears has been so large that the makers have never been able to keep up with the demand, otherwise we might have felt more concerned about the misrepresentations.

Coming to the points of criticism levelled against us, the principal objections have been as follows:

1. Unreliability!—Surely this has been completely dispelled!

2. Slowing the back wheel!!—Reply: A machine fitted with a hub gear made the fastest lap in the 1913 T.T. Junior Race, and the machine won the race!!

3. Difficulty in taking out the back wheel!!!—This is the only objection that can now be held against the three-speed gear, and we throw down this challenge, that it is possible to take out the wheel of a machine fitted with a three-speed gear and replace the same within five minutes of the time taken with a machine not fitted with a three-speed gear!!!

Why not advocate counter-shaft brakes so that the back wheel could be more easily detached? There would be just as much reason in this as to complain about the three-speed gear. And how often does the back wheel require to be taken out? How many machines in our travels do we see on the side of the road with the back wheel out of the frame?

Really, Mr. Editor, it is time to call a halt, and allow the hub three-speed gear manufacturers fair play. Our success has been such that we have been content to suffer in silence, but feel that the time is come for us to ask the press now to give us justice.

THE ARMSTRONG TRIPLEX THREE-SPEED CO., LTD.
E. C. Paskell, Director.

[Mr. Paskell alludes to the press in the above letter, but, so far as *The Motor Cycle* is concerned, we entirely deny that the hub gear has been received coldly, or that any prejudice has been shown against it.—Ed.]

Carburetters and Flexibility.

Sir,—With reference to the letter in the last issue of *The Motor Cycle* by Mr. Binks *re* carburetter flexibility, I should like to compete with anyone with my new twelve-jet carburetter. The same machine to be used, namely, a 5 h.p. overhead Matchless-Jap, 3½ to 1 fixed gear, preferably with sidecar and two twelve stone passengers. Magneto to be fully advanced all the time. J. H. WILKINSON.

The A.C.U. Six Days Trials.

Sir,—I have read the reports and the comments on the above, with the correspondence printed on the subject, and if I may venture to criticise as one who is neither a member of the A.C.U. nor at all in agreement with its policy, I should like to suggest to you and your readers that the least said by the disappointed folk who went for the Trials the better.

When are we to have an end of this unsportsmanlike spirit that is showing itself amongst motor cyclists. Other people go in for other sports, and we do not immediately get strikes and most fierce letters to the press the moment they find that they cannot manage the trial to their satisfaction. Hats off to the A.C.U. for the trouble it took to make this trial a real test. Many of us in our daily work have quite as hard a time of it as some of the riders had. Some of us Sussex riders who have to be out in all weathers, who have to ride flinty, terrible roads all the year, over downs, through farmyard tracks, over stony roads, and bad hills, through watersplashes, do not squeal like some of the riders did about it, and though we all admit the trial was a severe one, it was merely putting into six days' running the sort of thing some of us have to put up with many times in the year.

The trial was advertised as a Six Days Trial, not as a six days' pleasure trip, and I for one sincerely regret the prominence given to the dissatisfied riders. If they do not like it let them stay away from the next lot. At the quarterly trial held down South this year it was, to many of us, disgusting to hear the growling that went on. If motor cycling is a sport, and men enter for it, let them stand by the rough time they get, and not create a bother for the ruling body, who worked so splendidly to make it a success.

Some machines behaved splendidly—they could not all have had skilful *and* lucky riders—and yet you get the Sunbeams, Triumphs, Ariels, and others coming through with flying colours. If machines fall into pieces, if we learn that crank cases and gear boxes and parts are not strong enough for such strenuous work, if, at the same time, we learn that other parts that ought to be able to go right also did not, the trials are useful things, as many machines have to stand a most strenuous doing in a year of rough work. We do not all ride week-ends only; some of us are at it all weathers, all roads, all places, and have to get there or else give up motor cycles and take to more reliable methods; hence I for one say, "let the growling stop." It has been proved that motor cycles can do hard work, and the sooner motor cycle riders, trade or otherwise, leave off growling every time they get a beating, and, like true British sportsmen, say "better luck next time," the better the sport will be. I was not at all impressed by your comments, as I should have preferred to see the leading motor cycle papers going for sportsmanship clearly and with no indefinite voice. R. C. MEASURES.

Competitors' machines lined up in the hotel yard, at Grantham,—the luncheon stop in the Essex M.C. 24 hours' run to York and back.

ESSEX M.C. ANNUAL 24 HOURS' RUN.

LONDON TO YORK AND BACK.

IN drizzling rain the first man was despatched from the Eagle Hotel, Snaresbrook, at seven o'clock last Friday evening. There were three lady riders competing, Miss Hammett (2¾ Douglas), Miss Baxter (2½ Connaught), and Miss Berend (7 Indian sc.). Whereas the former was riding an open frame machine, Miss Berend rode a standard Indian, with the addition of a very neat dress guard over the rear cylinder; L. A. Baddeley, a prominent M.C.C. member, occupied the sidecar seat.

The route was marked at night by means of red and green lanterns and lay through Hockerhill, Cambridge, Norman Cross, Grantham, and Doncaster, straight through to York. Rain continued to fall intermittently till Hockerhill was reached. The first check (open) was held here, in charge of Mr. Kapadia. On leaving this place the rain simply poured down, and continued to do so until Cambridge was reached, where a check (open) was held and fifteen minutes allowed for replenishing both man and machine.

Early Retirements.

Soon after leaving Hockerhill, Deacock, who was riding one of the two lightweight machines with sidecar attached, broke his driving chain, and as the spare links did not fit he was obliged to retire. Some fourteen miles from here Miss Hammett, also on a Douglas, was obliged to retire owing to the state of her eyes. During the Scottish Six Days she was badly bitten by mosquitos, and the night riding found out a weak spot again. The third rider to give up was Gordon Fletcher, who ran into the Cambridge control five minutes early, and as this mistake would probably have robbed him of a gold medal he decided to retire. The lightning up to this point was very vivid, and many of the competitors thought this had affected their watches. The next check (open) was held at Godmanchester, and six miles further on the first secret check section entered. Four sections were marked on the route card wherein a secret check would be held. The first was found one and a quarter miles past the top of Alconbury Hill, and was in the hands of Mr. E. J. Bass. An uneventful run now brought us to Stamford, where the rain had subsided to some extent, only to begin pouring down again a few miles out, and to continue thus right in to Grantham.

A Welcome Rest.

Here supper was served and one hour's rest allowed. After leaving in the rain an A.A. scout directed many on to the wrong road, among whom may be mentioned Cocks, with his little 2½ h.p. Connaught and sidecar, also Miss Baxter. After travelling some little distance they found themselves in a ploughed field, so decided they were off the route and returned. Cocks again lost his way at Barnby Moor and went several miles off the course, added to which both he and Miss Baxter suffered generator trouble. Some three miles north of Bawtry Mr. Bass held the second secret check. Webster arrived somewhat late through taking a wrong turning just outside Bawtry. The rain now stopped, and we had a fine run into Doncaster (open check), and thence on to York.

The York Control.

The morning was very foggy and dull when the timekeeper and one or two others awaited the arrivals at 6 a.m. at York. The control was at the Windmill Hotel, where breakfast was served. Punctually at 6.22 Webster and Brown arrived, followed in quick succession by a large batch of competitors, all of whom came in well up to time. We remained at the control till 9 a.m., and, except for the retirements mentioned, there were no late arrivals. The two ladies looked particularly well and fit, but all complained of the terrible weather experienced up to Grantham. A. T. Stanton repaired a puncture.

Just before reaching York, Brown, who had been "blinding" a great deal, broke his exhaust valve. Luckily, however, he carried a spare, and after fitting it he continued. MacDonald found it advisable to fit a larger jet; he had also lost part of his silencer, which caused his engine to make a terrible noise. Many told us tales of woe at York. Miller complained of serious belt slip, which caused him to arrive late at Cambridge. Cass and Beal had on several occasions been off the road, and the latter reported having run into a donkey, which he said he knocked down without doing any

Essex M.C. Annual 24 Hours Run.

damage to rider or machine. Worley had to take his carburetter down three times owing to some rag having entered his tank. Pearson had lost the shoe of his rear brake, and was obliged to put his foot on the flywheel when he wished to pull up. News came to hand that Applebee, sen., had hit a horse with his B.S.A. and sidecar, which caused his retirement. After a welcome rest the competitors were started on their return journey, the first man leaving at 7.30 a.m.

The Return Trip.

The same route was followed as on the outward journey. The first secret check section started at Ferrybridge, the check being found six miles past this place. Some two miles past the check Sewter had the misfortune to blow off one of the cylinders of his Humberette. The going through Doncaster was very bad, the tramlines being in a very greasy condition. After checking in here, a fine run brought us to Grantham where one hour was allowed for lunch. Just before Grantham Cocks had trouble with his front wheel. On making investigations he found that a ball had broken and had ruined his cone. This occurred some ten miles from Newark, but a passing Humberette driver very kindly took him into Newark, where he fixed things up and returned to his machine again on the cycle car.

Soon after leaving Grantham, Whitmore was worried by his Armstrong gear, the clutch appearing to slip momentarily when pulling up hill. After a good dose of oil his trouble disappeared. Just outside Stamford we found Pearson with his front wheel out fitting a new tube. It appeared that he and Brown had collided while travelling at a good speed. The last secret check was found at the Norman Cross Hotel, again in the hands of Mr. E. J. Bass.

After checking in at the top of Alconbury Hill we pushed on to Huntingdon, where we met Dr. Moss-Blundell on his Green-engined sidecar. This machine

Rex Mundy (Triumph) and C. Pearson (Douglas) at an early morning check outside Doncaster.

appears to possess a fine turn of speed. At Cambridge, where fifteen minutes were allowed for tea, Frank Applebee was checking the competitors. A mile after passing Great Chesterton, R. M. Brice, of Brown renown, was running a secret check to find competitors ten minutes ahead of time. This meant disqualification for those caught. The next check was held at Hockerill, but a mile or so outside we found Applebee, sen., running another secret check.

Upon enquiring of him for particulars of his smash, he informed us that in the dark he had hit a horse, which put its foot through the body of his sidecar and at the same time fell on his passenger. Both luckily escaped serious injuries. Soon after leaving Hockerill rain commenced to fall again, and continued practically all the way to the finish.

Wortley reported tyre troubles, having used four tubes and then had to send several miles into a village to get another one. Hemy punctured near Great Chesterton. Phillips, on the Warne cycle car, had a puncture and a burst, the latter being caused by a nail. An 8 h.p. Williamson successfully completed the double journey with a two-seated sidecar attached. Miss Baxter was heartily cheered on finishing at Snaresbrook. She had undoubtedly put up a splendid performance in finishing the course considering the weather conditions on the outward journey. Mr. Stenson Cooke, secretary of the A.A., accompanied the competitors throughout on a 40 h.p. Oakland car. The officials of the club wish to acknowledge the help received from the A.A. scouts all along the route. The following finished the course within twenty-five hours :

MOTOR CYCLES.

W. W. Webster (3½ Rudge).
L. G. Brown (3½ Corah Jap).
A. C. Stephens (3½ Triumph).
H. R. Whitmore (3½ Rover).
R. G. Mundy (3½ T.T. Triumph).
C. Pearson (2⅜ Douglas).
H. J. Beal (4 L.M.C.)
F. Roberts (3½ Singer).
G. T. Gray (5 Rudge).
S. Tharp (3½ Triumph).
A. G. Peppercorn (3½ Bradbury).
Miss Baxter (2½ Connaught).

SIDECARS.

A. G. Cocks (2½ Connaught).
F. H. Worley (6 Matchless).
Miss Berend (7 Indian).
B. A. Hill (7 Indian).
A. F. Brassington (6 Rex).
A. R. Abbott (3½ Bradbury).
A. T. Stanton (3½ Bradbury).
W. C. Hemy (6 Clyno).
A. H. Gold (8 Williamson).
J. H. Kerr (3½ N.S.U.)
F. L. Cook (4½ Calthorpe).
L. Cass (6 Trump).
A. E. Ufflеman (8 Chater-Lea).
Victor Garland (8 Williamson).
A. Miller (6 Zenith).
K. A. MacDonald (3½ Singer sc.)

CYCLE CARS.

J. Chater-Lea (8 Chater-Lea).
A. B. Phillips (8 Warne).

P. Alan Hill (7 h.p. Indian sidecar), J. H. Kerr (3½ h.p. N.S.U.), and another leaving York for the return journey to Woodford.

Road Tests of the New B. and B. Carburetter.

SINGLE OR DOUBLE LEVER CONTROL AT WILL.

THE problem of perfect carburation at all speeds is one which claims attention from all classes of motorists; motor cyclists, therefore, will be particularly interested in the new B. and B. carburetter, which has been the subject of twelve months' constant experimenting by Messrs. Brown and Barlow, of Westwood Road, Witton, Birmingham. The carburetter which we are about to describe is the result of this firm's experience with three earlier models: the standard single jet type, the universal, and the single lever automatic carburetters. The knowledge gained from these three models has enabled the firm to design a carburetter which can be treated, if desired, as a semi-automatic model, and is particularly easy to manipulate when so treated, especially at the low speeds necessary in slow moving thick traffic.

For the purpose of explanation four sectional views are given with the throttle valve in different positions. Fig. 1.—When running dead slow at no load. Fig. 2.—When on the level at about 20 m.p.h. Fig. 3.—When almost at full speed. Fig. 4.—At a point between 1 and 2.

Referring to the illustrations below, it will be seen that this carburetter is adapted for a double lever control, one lever of which controls the throttle T, and the other the air valve A. The construction of the throttle T is such that when it is opened it also uncovers 60% of the total available amount of air, so that the maximum amount of extra air that is under control by the air valve A only amounts to 40% instead of the usual 100%. This 40% is the amount of variation actually required to provide for the extreme conditions met with during running. To the throttle valve T is attached a needle N, which works in the jet so that as the throttle T is raised or lowered, the needle N is raised or lowered the same amount in the jet J. The first portion of the needle at N1 is parallel, and, after a certain distance, is tapered to the end. The jet J in which the needle slides is situated in a small choke tube C, so that a small amount of air enters at this point sufficient to break up the petrol as it issues from the orifices. Completely enclosing the top of the choke tube is a cap S, into which the petrol spray and air pass from the jet and choke. This cap is provided on one side with a number of holes S1 of small diameter, through which the petrol and air have to pass, thus ensuring perfect vaporisation. The throttle T is provided on the engine side with a small slot T1 to give ease of control when running slowly, and the corresponding part of the throttle on the other side T2 is cut away the whole width of the throttle. It will thus be seen that the air intake to the carburetter I is opened in advance of the outlet to the engine P. The proportions of the carburetter change as the throttle T is altered to suit various conditions met with at moderate speeds, this without any aid from the extra air valve A

Taking the position shown in fig. 1, we have a very small outlet to the engine formed by the top of the slot in the throttle, and the intake side of the throttle T completely shuts off the air. Under these conditions the whole of the air required must come through the choke tube C around the jet J, and it is a comparatively easy matter to make the size of the petrol orifice (*i.e.*, space around the needle N1) correct to run the engine dead slow when free.

Now, assuming that the throttle T has been opened out to fig. 2 position, in doing this we have, during the first portion of the opening, opened the slot T1 only on the engine side of the throttle, but giving a fair amount of air on the intake to the throttle I. Thus for the first part of the movement the inlet I to the carburetter is larger than the outlet P to the engine. At the same time the needle N has been raised out of the jet J, but the area around the needle N1 has not been increased. An equivalent process, however, has taken place, viz., the frictional resistance of the fluid between the needle N1 and the nozzle J has become less, and at this point has reached a minimum, and from now onwards the area around the needle N1 increases, with a consequent increase in the flow of the petrol.

Now taking fig. 3, in opening the throttle T through position fig. 2, the outlet will begin to increase quicker than the inlet I (owing to 40% of the available space on the inlet side being occupied by the air valve A), until at posi-

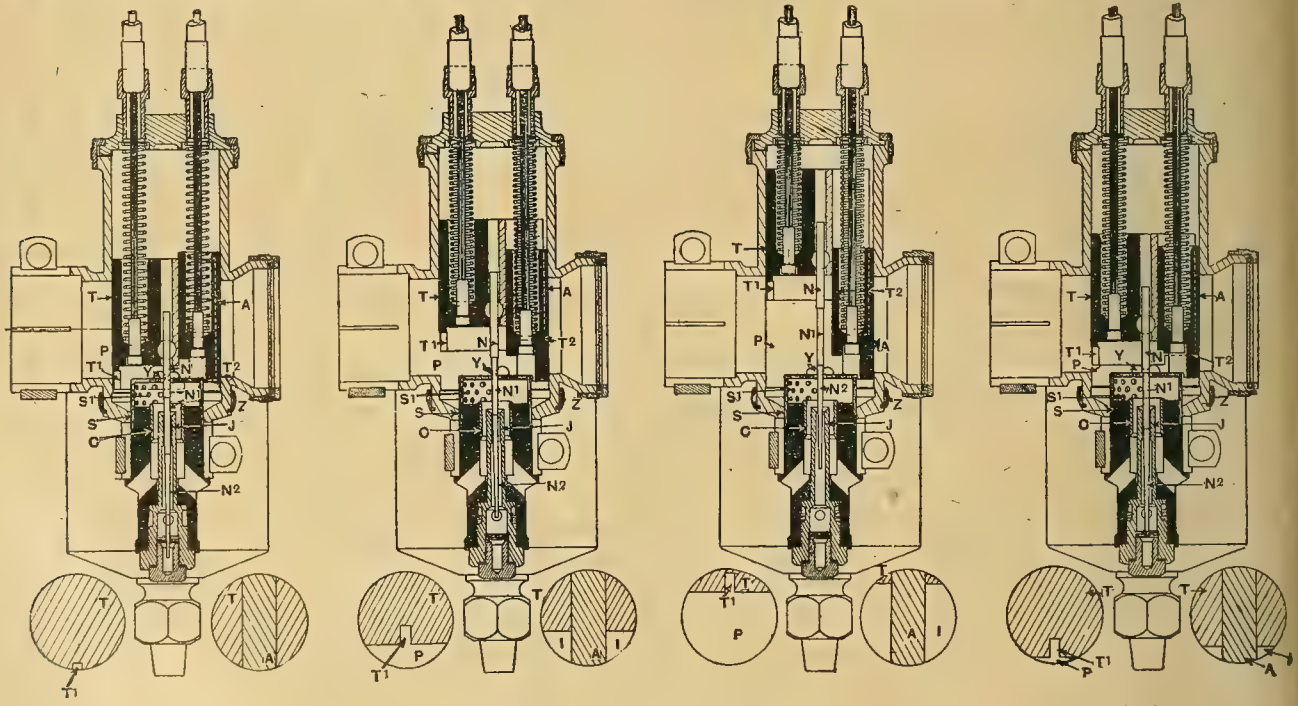


Fig. 1. Fig. 2. Fig. 3. Fig. 4.

Sectional views of the new B. and B. carburetter.

(1) Carburetter set for running dead slow at no load.
(2) On the level at about 20 m.p.h.
(3) At almost full speed.
(4) At a point between Nos. 1 and 2.

B. and B. Carburetter.

tion 3 the outlet P is larger than the inlet I. At this position the needle N has been raised a similar amount, and at this point the space around N2 of the needle is such as to give the mixture required for slow heavy pulling, the needle N2 having a proportionate increase in its taper from position 2, through position 3, and on to the full open position. The taper N2 on the needle steadily increases the size of the petrol orifice in correct proportions, starting from minimum size and finishing with the throttle T at the full open position. It has been found that practically all machines answer to the same setting on positions 1, 2, and 3, but there is a slight difference in the position midway between 1 and 2, and shown in fig. 4. This is owing to the slight variations in the valve design on different makes of engines. In some instances, when driving as a single-lever carburetter, *i.e.*, with the air valve A obstructing the intake, it is found that the mixture which is right at position 1 increases slightly in richness at position 4, and then falls back to the correct mixture at position 2, and afterwards is correct for the remainder of the opening. This slight variation has been provided for as follows: Two small air holes Y (completely closed by the throttle T when in position 1) are gradually opened as the throttle T is opened until position 4 is reached, when both holes Y are fully opened. On the outside of the body is a rotating member Z, which can be turned to uncover these holes Y to any desired extent. The rotating piece Z is then set, when the throttle T is at position 4, to suit the particular engine to which the carburetter is fitted, and left at that, no alteration being necessary after once setting.

Variable Jet Opening.

The firm's claims for this new model are simplicity, ease of adjustment and fitting, economy, and capability to take very heavy loads up the steepest hills, the last owing to a big jet which is provided to give maximum power on full throttle. As the great proportion of riding is done on a small jet, there is no waste of fuel owing to the provision of a big jet for maximum power, as the jet is variable. The petrol is vaporised in a complete manner, with the result that a good uniform mixture is fed to the engine at all speeds, so obviating overheating, which is often the result of bad carburation. It is also possible at all ordinary speeds to give an excess of air, thus making it possible to drive to the utmost nicety as regards consumption, if it be so desired. There is also an absolute absence of any blow-back of petrol.

The Road Tests.

Mr. C. Brown, although satisfied in his mind that these claims are accurate, wished us to prove to our own satisfaction that the new carburetter will do all that is claimed for it. In consequence, he invited us to make some road tests of the carburetter under varying conditions, using both the single and double levers. The tests arranged were flexibility (slowest and fastest), power on hills, acceleration, and consumption.

A Midland Route.

The route chosen was the firm's usual test course from Birmingham to Kidderminster, Bewdley, Cleobury Mortimer, Hopton, Clee Hill, Tenbury, and the old road from Tenbury to Worcester, which includes Hill Top Bank, near Rochford, returning through Stourport, Hartlebury, up Mucklow Hill to Birmingham. The first thing we noted was the easy control of the machine in traffic with the air valve closed and the carburetter manipulated as a one lever type. It was possible to crawl through traffic, and to bring the machine to a standstill with the clutch out and the engine just ticking round, re-starting being effected by simply opening the single lever throttle control. Once out of traffic, the air valve was brought into play, and with this open the requisite amount, speed could be controlled entirely by the single lever, and we noticed no sensitiveness at speeds varying from twenty to thirty-five miles an hour.

Steady Climbing

Those who know the route described above are aware that it comprises some steep hills, including Lem and Clee hills. The former has a steepest gradient of 1 in 7, and was ascended with a James sidecar on top gear with passengers weighing 26 stones. From Hopton to the summit of Clee is about two and a half miles of steady climbing, and we particularly noticed the even note of the exhaust during the whole ascent, and not the slightest sign of overheating.

At Tenbury we conducted a short experiment to prove slow running with the machine jacked up on the stand, and succeeded in getting as low as 300 r.p.m., with the engine firing evenly the whole time. (Will those who think 300 r.p.m. easy of accomplishment make the experiment themselves?)

On Hill Top Bank

Hill Top Bank was chosen for the hill-climbing test, two trials being made with a standard 1913 B. and B. single jet two-lever carburetter fitted with a No. 34 jet, and two trials with the new carburetter. The machine used was the works "'bus," an old 3½ h.p. Triumph, which has had nothing particular done to it since it was overhauled by the makers some nine months ago. The gear ratio was 4⅔ to 1. We convinced ourselves that we could not climb the hill with the standard carburetter and the gear ratio employed, but with the new carburetter on we reached within a few yards of the top, and Mr. Brown took the machine clean over at a minimum speed of 18 m.p.h. The Contour Book gives the gradient of this hill as 1 in 7. This is the average, as one section is about 1 in 5, and its length is about a mile.

Flexibility Tests.

The above tests consisted of riding the machine over a measured one-third of a mile with a flying start at the slowest and fastest possible speeds with air valve closed and controlling the carburetter by the single lever, and with both levers in use. The machine was ridden in a straight line, the engine firing regularly; neither clutch nor change-speed gear was fitted. The results will be found in the next column.

FLEXIBILITY TEST.

MEASURED DISTANCE ⅓ MILE.

	m. s.	m.p.h.
Slow with One Lever.		
1st trial	2 54	6.9
2nd trial	3 13	6.2
Fast with One Lever.		
	0 43	27.9
Fast with Two Levers.		
	0 23⅖	51.28

The high-speed test with one lever may appear slow, but it must be taken into account that this proves that the machine can be driven up to nearly 28 m.p.h. on the level without making use of the air valve lever.

For the acceleration test we used a Bonniksen speedometer, the hands of which show the amount of acceleration possible. The average of several tests, all with the single lever, be it noted, showed that it is possible to accelerate from 10 to 20 m.p.h. in five seconds on level ground by merely opening the throttle valve.

Consumption.

The consumption test was made over an undulating course, starting from the works towards Sutton Coldfield. This necessitated many sharp turnings, sudden accelerations, and a few short fairly steep hills. The same machine and carburetters that were used for the hill-climbs, without any alteration in setting or gear ratio, were employed. The float chamber was first drained dry and connected to a special tank holding .0905 of a gallon of petrol. The first test was made with the new model, and the distance, measured by Jones's speedometer, was 11.6 miles—128 m.p.g.

The 1913 model was then fitted, float chamber drained in the same manner, and connected to the special vessel, the result being a petrol consumption of 121½ m.p.g., the distance covered being exactly eleven miles.

It should be mentioned that the machine was ridden under touring conditions, and at a speed of between twenty and twenty-five miles an hour.

Power with Small Consumption

We think our readers will agree with us that the above test conclusively proves that the new B. and B. provides what it is impossible to obtain with a single jet of the ordinary type, viz., full power for hill-climbing, and a small petrol consumption for all ordinary speeds. This is what the makers have aimed at, and we certainly think that they have been successful.

Incidentally, we may mention that we tried one of these carburetters on a twin-cylinder sidecar machine of our own. The average previous best consumption was about fifty miles to the gallon, but by careful driving at the second attempt we were able to show a consumption of 70 m.p.g. over a distance of 6.3 miles. With this setting, we noticed no falling off in power on hills, and the ease of control was very marked, particularly when starting engine, and running slowly with clutch out.

To sum up we think that this new production of Messrs. Brown and Barlow marks a very considerable advance in the matter of motor cycle carburation.

TIME TO LIGHT LAMPS.

September	4	... ..	7.40
,,	6	... ..	7.35
,,	8	... ...	7.31
,,	10	... ...	7.26

Liege-Paris-Liege Trial.

In addition to the list of first-class awards in the above trial, particulars of which were published last week, E. Taymans, a Belgian rider and private owner of a Triumph, won a gold medal. He was riding the only Triumph entered.

Paris-Tours Reliability Trial.

This event will take place on the 14th September over a distance of 145 miles. The route taken will be *via* Orleans and Blois. The event is being held by the Touring Motor Club of France, under the rules of the Union Motocycliste of France. There are classes for practically every type of motor cycle on the market, including sidecars, tricars, and cycle cars. Speeds vary from 15½ miles for machines of 250 c.c. up to 18½ miles per hour for motor cycles of 1,000 c.c. and cycle cars of 1,100 c.c.

Entries close on Tuesday, September 9th, and should be sent to Mr. R. Desitter, 48, rue de Moscou, Paris. Entry fees: Trade, 40 francs each motor bicycle, sidecars or cycle cars 50 francs; members of foreign clubs, motor bicycles 35 francs, sidecars or cycle cars 40 francs.

Suggested Carburetter Trials.

In the issue of July 10th we published an article on automatic carburetters, and suggested that the Auto Cycle Union should organise a trial for the purpose of testing different carburetters on motor cycles. Our suggestion has been taken up with enthusiasm by several prominent manufacturers, and we would draw the attention of the Auto Cycle Union to this fact. We cannot but think that a trial of the leading makes of automatic carburetters, with a view to testing the flexibility and power obtained therefrom on some standard make of motor cycle, would produce data of the greatest interest to riders and the industry.

A.A. and M.U. Notes.

SPECIAL PATROL ARRANGEMENTS.—Special patrol arrangements have been made by the A.A. and M.U. in connection with the Doncaster St. Leger meeting (September 9th, 10th, 11th, and 12th). All the roads will be fully patrolled, and in the vicinity of Doncaster, where traffic is likely to be heavy, extra patrols will be put on duty.

EARLY LIGHTING-UP WARNING.—Members are requested to drive carefully and to light up early between Dunstable and Hockliffe on Sunday evenings. Several herds of cattle and flocks of sheep are regularly driven between these two places from five to eight o'clock.

SPECIAL FEATURES:

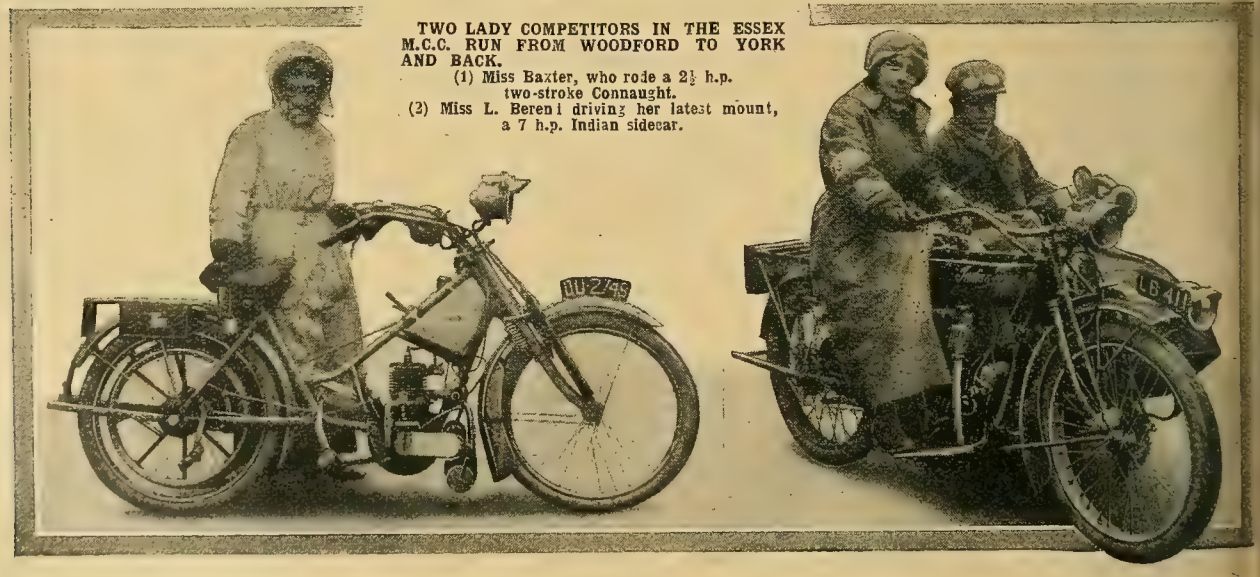
AMONG THE LAKES*
With the Six Days' Riders in the North.
ROAD TESTS OF A NEW CARBURETTER.
ESSEX M.C. 24 HOURS' RUN.

Import Duties on Motor Cycles.

The United States Senate Finan Committee have been considering t question of the duty on automobiles a motor cycles imported into the Unit States of America. The duty on mot cycles up to date has been 40% *valorem*, but in future the commit recommend that the duty be 25%. T should give British manufacturers chance of doing some business in U.S.A.

Illumination of Number Plates.

Motor cyclists generally are cautio so to fix their head lamp that it il minates the front number-plate on e side after dark. The chief constable Derby has pointed out in a very courte communication sent to the secretary the Derby and District M.C.C., t motor cyclists in Derby are infring the regulations, as the lamps, in m cases, are fitted too high. Motor and the police in Derby and distr are on excellent terms, and motor cycl should see that the existing conditi are preserved.



TWO LADY COMPETITORS IN THE ESSEX M.C.C. RUN FROM WOODFORD TO YORK AND BACK.
(1) Miss Baxter, who rode a 2½ h.p. two-stroke Connaught.
(2) Miss L. Berent driving her latest mount, a 7 h.p. Indian sidecar.

Three cycle cars in the Essex M.C. twenty-four hours. Reading from lef to right they are 8 h.p. Chater-Lea (driven by J. Chater-Lea), 8 h.p. Humberette (J. F. Sewter), and 8 h.p. Warne (A. B. Phillips).

Brooklands Automobile Racing Club.

The following races will be decided at the B.A.R.C. meeting on Saturday, October 4th: The Seventeenth Short Motor Cycle Handicap for all classes of motor cycles, distance 5¾ miles, and the Fourteenth Long Motor Cycle Handicap, distance 8½ miles. Entries close September 22nd at noon.

The A.C.U. Trials.

A competitor in these recent trials writes to say that he does not consider the hill at White Shaw Moss, sometimes called Gastack Beck, by any means unrideable, although the surface was undoubtedly rough. He also says that the hill near Durham, known as Little Honister, had an abnormal surface on the day in question, but that this was caused by the weather, and that the same thing applies to the hill at Alston. This competitor entirely approved of the course chosen and thoroughly enjoyed himself.

Road Warnings.

The police are extremely active in the village of Great Ormesby, on the road from Yarmouth to Stalham, and also at Potter Heigham, on Hickling Broad.

Motor cyclists on the road between Scarborough and Malton should take great care in passing the village of Sherburn, as there is a most dangerous cross-road at this point.

Military Motor Cyclists. Motor Cycles v. Horses.

The manœuvres which were to have been carried out by the 4th Cavalry Brigade in Northamptonshire and Buckinghamshire next week, will be seriously interfered with owing to the outbreak of mange amongst the horses of the 3rd and 20th Hussars, preventing these regiments from taking any part in the manœuvres. This is another point in favour of the establishment of a trained corps of motor cyclists, as it is considered that for despatch riding and orderly work an efficient motor cycle and trained rider could do the work of about six horsemen. A general finding himself in the predicament of being unable to use part of his cavalry owing to an outbreak of disease amongst his horses would not be so seriously handicapped if he had a body of trained motor cyclists at his disposal who could undertake many of the duties carried out in the ordinary way by his mounted troops, and so leave him the greater proportion of his cavalry for reconnaissance.

FUTURE EVENTS.

Sept. 6.—Scottish A.C.U. Speed Championships at St Andrews.
„ 6.—A.C.U. East Midland Centre Speed Trials.
„ 13.—Mersey M.C. Open Hill-climb at Pen-y-Ball.
„ 13.—B.M.C.R.C. Race Meeting.
„ 19-20.—Birmingham M.C.C. Open Trial to Carlisle and Back.
„ 20.—Streatham M.C.C. Open Speed Trials at Brighton.
„ 24.—A.C.U. Open One Day Trial.
„ 27.—Liverpool A.C.C. Open Reliability Trial.
Oct. 4.—B.A.R.C. Brooklands Meeting.
„ 11.—Coventry & Warwickshire M.C. Annual Open Hill-climb.

Well-known Motor Cyclist Married.

On Wednesday last the Rev. P. W. Bischoff, who is well known to most of our readers as an enthusiastic motor cyclist, was married to Miss Beatrice Langston at All Saints' Church, Brougham Street, Edinburgh. One of Mr. Bischoff's wedding presents was a Clyno and sidecar, on which the happy couple will tour in Devonshire.

Birmingham M.C.C. 24 Hours' Trial.

On September 19th, at 10 p.m., the start will take place at Perry Barr of the open reliability trial from Birmingham to Carlisle and back, promoted by the Birmingham Motor Cycle Club. Some valuable trophies are being put up for the competitors. First prize for solo machines will be the F. E. Baker Trophy, consisting of a silver cup; and first prize for passenger machines will be a watch presented by the Lloyd Motor Co., Ltd. In addition, gold, silver, and bronze medals will be awarded to successful riders. Entries close September 13th, and should be made to the secretary, Mr. B. C. Otley, 115, Colmore Row, Birmingham.

B.M.C.R.C. Fixtures.

On September 13th the B.M.C.R.C. holds a meeting confined to members. Eight events will be decided. The racing commences at 11 a.m., and the last event is due for decision at 5 p.m. Entries close Tuesday morning, Sept. 9th. Two one hour races are to be held, the Junior for teams of three machines of any one make not exceeding 350 c.c., and the Senior for teams of three machines of any one make not exceeding 1,000 c.c. Gold, silver, and bronze medals will be awarded in each class of each race and in the team races to each member of the winning teams. Members should at once correspond with other likely members to form a team and should state their partners on their entry forms.

Essex M.C.C. twenty-four hours Woodford to York and back ride. The 8 h.p. Williamson sidecar driven by V. Garland coming up the hill near Grantham.

A.C.U. SIX DAYS TRIALS.

Revised List of Marks and Awards.

SEVERAL alterations have been made in the marking, and, consequently, the awards in the Six Days Trials results. These have been due to the consideration of various protests, and to the fact that the firm of map publishers who measured the route were found to have made an error of four miles in the course followed on the Friday afternoon. C. R. Collier, who was down as having lost twenty marks, was misdirected at the foot of Kiln Park Brow, and did not protest at once. When he did eventually call the attention of the officials to the error, he was awarded a gold medal, and was found to have made the best performance in the sidecar class, thereby winning the Wheatley Cup.

The following riders have had their marks, etc., corrected as hereunder:

Rider and Machine.	Fig. of Merit for Whole Trial.	Total Marks, including Bonus.	Marks Lost.	Nett Marks Obtained.	Award.
DIVISION I.—CLASS B: 350 c.c.					
J. B. Sproston (2¾ Sunbeam)	102.04	99.4	6	93.4	Gold medal
T. C. de la Hay (2¾ Sunbeam)	142.55	104	0	100	Gold medal
H. Newey (2½ Levis)	105.66	101.96	18	83.96	Silver medal
DIVISION I.—CLASS C: 500 c.c.					
J. H. Kerr (3½ N.S.U.)	99.28	99.2	101	0	Bronze medal
A. E. Catt (3½ Triumph)	100.26	99.4	91	8.4	Bronze medal
F. W. Applebee, sen. (3½ B. S. A.)	133.9	102	69	33	Bronze medal
P. Shaw (3½ P. & M.)	97.18	92.18	1	91.18	Gold medal
W. H. Longton (3½ Alldays)	115.37	101	2	99	Gold medal
K. A. Macdonald (3½ Singer)	102.74	98.4	40	58.4	Bronze medal
C. Lester (3½ P. & M.)	116.27	100	4	96	Gold medal
DIVISION I.—CLASS D: 750 c.c.					
J. A. Neumann (5-6 Rudge)	119.48	102	81	21	Bronze medal
F. H. May (5-6 A.J.S.)	97.7	99.2	28	71.2	Silver medal
G. W. Braithwaite (5-6 Rudge)	129.82	100	10	90	Gold medal
G. Hunt (5-6 Campion)	139.6	100	21	79	Silver medal
J. Richard (4½ Sun-Precision)	114.63	102	19	83	Silver medal
J. D. Drysdale (5-6 Hazlewood)	110.1	102	4	98	Silver medal
DIVISION I.—CLASS E: 1,000 c.c.					
J. R. Alexander, jun. (7 Indian)	140.56	104	10	94	Gold medal
J. F. Morrison (5-6 Bat)	99.73	100	38	62	Bronze medal
DIVISION II.—CLASS H—SIDECARS: 750 c.c.					
G. Freeman (5-6 Clyno)	119.39	103	5	98	Gold medal
G. Nott (5-6 Clyno)	114.05	104	34	70	Silver medal
DIVISION II.—CLASS I: 1000 cc.					
C. R. Collier (7-8 Matchless)	141.11	104	4	100	Gold medal
DIVISION III.—CLASS K—CYCLE CARS.					
E. B. Slater (8 J.B.S.)	115.89	95	17	78	Silver medal

TEAM PRIZES (CLUBS).

1. Westmorland M.C.C. (231 marks).—G. W. Braithwaite (5-6 Rudge), H. Gibson (3½ Bradbury sc.), and W. Westwood (3½ Triumph).

2. Cumberland M.C.C. (270.8 marks).—W. B. Little (3½ Premier), T. B. Westmorland (3½ Premier), and R. Drinkhall (4½ Quadrant).

3. Essex Motor Club (267 marks).—G. T. Gray (5-6 Rudge), H. Gibson (3½ Bradbury sc.), and B. A. Hill (7 Indian).

TEAM PRIZES (TRADE).

1. Components, Ltd. (Ariel) (296 marks).—A. C. F. Andrews, F. C. North, and L. Newey.

2. Messrs. Phelon and Moore (P. and M.) (290 marks).—W. J. M. Sproulle, W. C. Drake, and P. Shaw.

3. The Hendee Manufacturing Co. (Indian) (284 marks).—E. A. Colliver, B. A. Hill, and J. R. Alexander, jun.

WHEATLEY CUP.

C. R. Collier (7-8 Matchless and sidecar).

A LETTER FROM THE A.C.U. SECRETARY.

Sir,—The amount of notice that has been taken, particularly in the general press, of the behaviour of certain competitors in the recent Six Days Trial and the gross exaggeration of the difficulties of the course will, I am afraid, tend to obscure the valuable object lessons that both the public and the trade may learn from this trial.

I trust, therefore, that you will give this letter the same publicity, not because it is in any sense an official explanation or statement, but because I am personally responsible for selecting most of the route, and by reason of my position should be able to demonstrate the value of the trial more authoritatively than certain misinformed journalists or disappointed competitors.

I need hardly labour the principle that the Six Days Trials have from their commencement in 1903 been organised with the sole object of encouraging the use of the motor cycle. This encouragement has been effected by demonstrating to the public how successfully the motor cycles entered have met the conditions that year by year have been made more difficult, and simultaneously by providing the manufacturer with a measure of the factor of reliability of his particular make. As machines have improved so have the regulations become more stringent, until a point was reached at which the personal element of the skill and good luck of the rider was of equal importance to the excellence of his mount.

Recognising this fact, it was obvious to the Competitions Committee of this Union that, if the trial was to continue its useful work, the personal element of luck must be discounted, hence the paragraph in the General Conditions to the effect that hills with an abnormal surface, that were dangerous, or too narrow, would be excluded. The Union assumed that the most skilful of this country's riders would enter, and, that they might do justice to their mounts, set them the most difficult course they could find in the district chosen, drawing the line at hills on which, given a suitable machine, it is more a question of luck than skill whether one

climbs it or not. I maintain that in the whole course of the trial there was no hill that a skilful driver should fail on, unless on account of some fault in his machine, or through being baulked by other competitors. When surveying the route a number of hills were visited (and most of them climbed) that were ruled out as, for the reasons above stated, they were considered abnormal. Honister Pass, the road over Bootle Fell, Bleatarn, of last autumn one day trial memory, a hill to the immediate west and parallel to Peat Hill, an extraordinary acclivity connecting this hill with the top of Peat Hill, and the hill leading south out of the village of Dent were amongst these on which the surface was considered abnormal, and on which a climb was considered to be largely a question of luck.

A considerable part of the trial was over very rough surfaces, particularly in Yorkshire, but such surfaces are the normal ones for nearly all secondary roads in that district. The drought had made them very loose, and consequently uncomfortable to drive over, though, personally, I should prefer such roads to many suburban ones I know of, and I am sure the latter stress wheels and frames more than any surface traversed in the trial, not excepting the gulleys on Crossdale and Buttermere Hause. The Union has been criticised for including watersplashes of two feet in depth (one paper stated three feet!). The deepest watersplash crossed in the trial had 8in. of water flowing over it on the day in question. Fords of this depth are met with all over England, and, in my opinion, the modern motor cycle should, and can, be driven through such splashes without difficulty. The remaining bone of contention was the scheduled speed of 20 m.p.h. To average 20 m.p.h. over many parts of the course needed a generous throttle opening and frequent application of brakes, and, consequently, as was intended, *cut down the time for adjustments and engine cooling to a minimum.* An inspection of the timekeepers' sheets shows, however, that the majority of riders drove extraordinarily closely to the schedule, and that those who were late had usually failed in other directions. Moreover, it appears to have been overlooked that on certain difficult parts of the trial the speed was reduced to 15 m.p.h., and that before the stewards (on the plea of personal danger) increased the permissible margin of error, it was possible to have driven for from eight to fifteen miles at a stretch at 5 m.p.h. less than the set speed without incurring any penalty.

I would suggest that it was simply because a number of competitors were unused to the undoubtedly difficult conditions that they found Tuesday's route so arduous. Personally, I consider Tuesday's run one of the easiest of the five, but then I surveyed it last of all, and had, perhaps, lost my sense of proportion! The fact that the driving of the competitors was much improved towards the end of the week, and that the two local club teams gained respectively first and second places, appears to bear out my contention that it was more the experience of the driver at fault than any unfair condition for the machine, in support of which is the additional fact that the 10.4 h.p. Grégoire car which preceded the competitors covered the whole of Tuesday's run without difficulty, and in spite of numerous stops to put up arrows, etc., made up time on schedule.

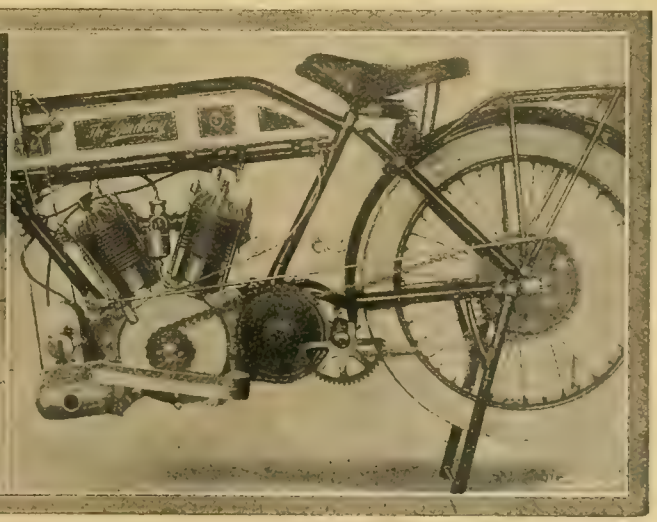
The value of the flexibility, acceleration, and speed tests has been somewhat overshadowed by the more sensational features of the trial, but it should be remembered that it was just the severity of the course as a whole that rendered these particular tests so interesting and instructive. These subsidiary tests are also valuable in that they furnish a satisfactory means of finding a winner from amongst the large percentage of competitors that gained full marks. The percentage of medal winners is my concluding argument, and I contend that these figures are a magnificent tribute to the reliability of motor cycles. Out of 161 starters 51 have obtained gold medals, 22 silver, and 26 bronze medals. These results prove conclusively, to my mind, the value of the trial; my only regret is that the sportsmanship of a minority of the drivers has not been displayed to the same advantage.

T. W. LOUGHBOROUGH.

A NEW BRADBURY TWIN-CYLINDER MODEL.

WHISPERS of a more powerful Bradbury model than the 3½ h.p. single-cylinder have, for some time, been heard in Oldham, and now it has been decided to market for 1914 a twin-cylinder three-speed motor cycle of 750 c.c. The cylinders are placed on the crank case at 50%, and are offset to secure larger bearings for the connecting rod big ends. The transmission is by Hans Renold chains throughout, which, in the marketed product, will be totally enclosed, although our photographs show the drive exposed. The makers have evidently been largely influenced by the admirable A.J.S. design, both in the engine and the general lay out of the machine. The engine is fitted with detachable cylinder heads, held down by long bolts to the crank case. Large diameter side-by-side valves are fitted. The gear box is also reminiscent of the A.J.S. gear, and gives three speeds—the standard ratios afforded being 4½, 7½, and 13¼ to 1, very well proportioned ratios, in our opinion. A clutch with cork inserts should provide a gentle and progressive take up, and such clutches have an almost unlimited life and will stand a good deal of abuse from the novice without complaining. A large internal expanding metal-to-metal foot-operated brake is fitted to the rear wheel. Other details are a Best and Lloyd drip feed lubricator, a very large petrol tank, kick starter, dropped frame, and a very large silencer, under the magneto in front of the engine.

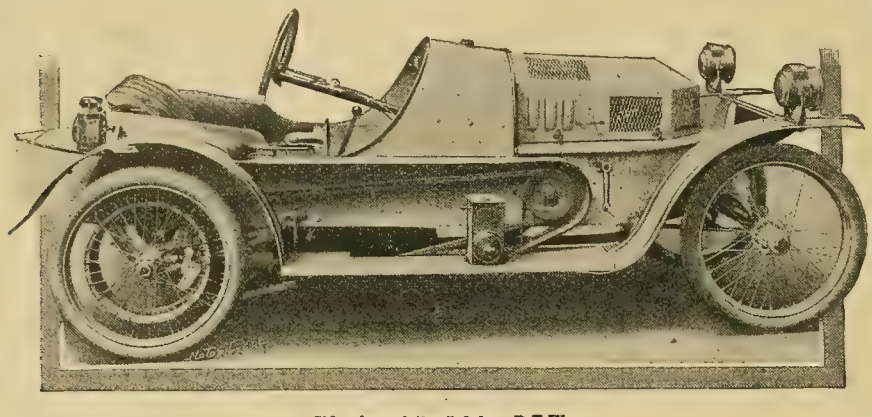
Hugh Gibson and J. Eastwood on a thousand miles test of the new twin Bradbury.



The Bradbury 7-8 h.p. twin-cylinder engine showing chain drive, with covers removed, three-speed counter-shaft gear and kick starter.

The Latest Type D.E.W. Cycle Car.

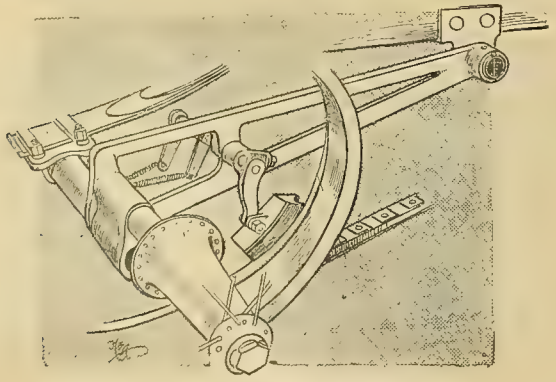
IN previous issues of *The Motor Cycle* we have given details of the early models of the D.E.W. cycle car, manufactured by the Dew Engineering Co., Eynsford, Kent. The model with which we are about to deal is a very great improvement upon anything yet turned out by Mr. Dew, and a company has now been formed, works have been installed, and the vehicle is properly on the market, we may therefore expect to see it in competitions before very long.



Side view of the 5-6 h.p. D.E.W.

The framework, consisting of the best seasoned ash members, which incorporates body as well, remains unaltered, but a 5-6 h.p. twin-cylinder Precision engine 76 × 85 mm., is now fitted. This engine is carried on a crossbar at its rearward end, and fitted in front to a bracket attached to the foremost portions of the frame. It is held by bolts passing through slotted holes in the brackets. On the front of the forward bracket is a single bolt, which, when the holding down bolts are slackened, if tightened up, draws the whole of the power unit gradually forward in a straight line, thus enabling the driving chains to be adjusted. A similar form of adjustment is used for the magneto chain.

The carburetter is the well-known Amac, and a Bosch magneto is fitted. The starting handle is fixed to a separate shaft, connected to the engine shaft by a chain and a pair of chain wheels, the one on the engine shaft being provided with a free engine clutch, by means of which the engine can be started.



Radius rods at the rear of the D.E.W. cycle car.

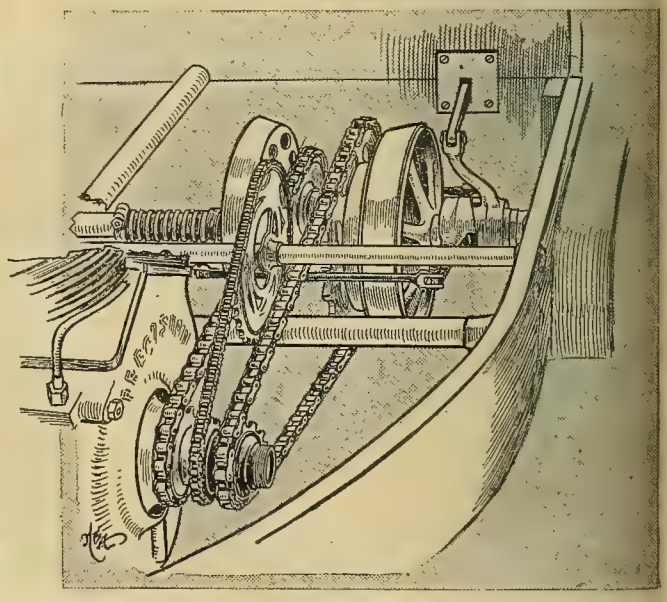
The two-speed gear is an innovation on the D.E.W. There are two chains and two friction clutches. The clutches run in double ball bearings, which also take the thrust. The gear control is by means of a pedal, which in its normal position gives the neutral. If pressed down, the low gear clutch is engaged, but if, after going into neutral, the pedal is kicked up, the high speed gear is engaged. The high gear is kept in position by means of a powerful spring, the low gear clutch being operated by means of inclined planes. On each end of the counter-shaft are mounted Skefko ball bearings, and on the end of the gearshaft, opposite the change-speed mechanism, the foot brake drum is carried.

The rear of the vehicle is sprung on cantilever springs, and the front axle is stayed by radius rods running to the first cross member of the chassis.

The steering is direct, and the wheel consists of special half wheel of large dimensions, allowing access to the body, and although the steering is direct it enables the vehicle to be steered with the greatest ease.

We drove the vehicle about six or seven miles, and were certainly impressed by the way in which it ran. It took all hills with the greatest ease, is controllable, and steered very well indeed. It is, in fact, a handy little vehicle.

A bonnet is fitted over the engine, and is arranged with louvres and wire-covered holes, so that plenty of air reaches the motor for cooling purposes. Large mudguards of the car type are fitted throughout, and a substantial guard covers each belt.



Details of the transmission, clutch and gearing of the latest model D.E.W. cycle car.

Streatham and District M.C.C. Open Hill-climb.

THE annual open hill-climb promoted by the above club took place on Saturday last on Up-Park Hill, near South Harting, Sussex. Up-Park Hill is on the right-hand fork at the foot of Telegraph Hill, which is generally used for hill-climbs. The surface of Telegraph Hill was somewhat greasy, and the officials did not consider it to be sufficiently safe for this competition. Up-Park Hill is practically straight, has a couple of easy bends, and a very fair surface. The timed section was one-third of a mile in length.

The weather was beautifully fine but rather close. Just before 3 p.m., when everything was ready for the start, a steam tractor drawing a trailer heavily loaded with gravel started up the hill. Olsson, Wilberforce, Axford, and a number of others jumped on board, evidently with a view to having a good look at the course with the minimum amount of trouble. All went well till the steepest portion near the crest (about 1 in 6) was reached, when the wheels of the tractor refused to grip, and the whole concern came to a standstill. Further efforts to restart made the tractor plough furrows in the road surface, so the only thing to be done was to use the winding gear. This was a long and tedious affair, and, though the men in charge worked with a will, the start of the competition was delayed nearly threequarters of an hour.

This was very hard luck on the organisers, who had really arranged things well and had everything ready for a punctual start. An excellent entry had been received, and there were ten classes. Each of these was divided into two sub-classes—"expert" and "general," the names of the experts being printed in italics. The results of Classes III., V., VI., and VII. were worked out on time, while formulæ were used for the others. The formula for Classes I., II., VIII., and IX. was that compiled by *The Motor Cycle*, $\frac{W}{C \times T^2}$, while that for Class X. was the A.C.U. formula, $\frac{W}{C \times T}$. In each class W = total weight of machine and rider, C = capacity in cubic centimetres, T = time in seconds. Class I. was for touring machines not exceeding 350 c.c. No machine was taken as weighing more than 140 lbs. for the purpose of obtaining the results on No. 1 formula, which were as follows:

GENERAL CLASS.

		Bore and stroke.	Fig. of merit.
1	M. Anderson (2¾ Humber)	60.75 × 60	9,515
2.	J. C. Bateson (2¾ Douglas)	60.5 × 60	9,455
3.	H. A. Fordham (2¾ Douglas)	60.5 × 60	8,857

In this class the winner cut out before crossing the finishing tape.

In Class II., for touring machines between 400 c.c. and 500 c.c., and in which no machine was taken as weighing more than 200 lbs., for the purpose of obtaining results on formula, J. Cocker (3½ Singer) made a magnificent climb and had a walk over in the expert class. The results in the general class were as follows:

		Bore and stroke.	Fig. of merit.
1.	S. R. Axford (3½ Martin)	85 × 88	9.183
2.	H. H. Barrs (3½ Triumph)	85 × 88	8.555
3.	T. Meeten (3½ Rudge)	85 × 88	8,455

Class III. was for similar machines, but the results were worked out on time. Results:

EXPERT CLASS.

		Bore and stroke.	Time.
1	J. Cocker (3½ Singer)	85 × 88	24⅖s.
2.	S. T. Tessier (3½ Bat)	90 × 77.5	25⅘s.

GENERAL CLASS.

		Bore and stroke.	Time.
1.	F. Lamb (3½ Premier) / R. L. Keller (3½ Triumph)	85 × 88	27s.
2.	C. Pattison (3½ Rudge)	85 × 88	28s.
3.	T. Meeten (3½ Rudge)	85 × 88	23⅕s.

Class IV. was for touring machines between 500 and 1,000 c.c. No machine in this class was taken as weighing more than 250 lbs. for the purpose of obtaining results on formula.

		Bore and stroke.
1.	G. Griffith (7 Zenith)	90 × 77½

Griffith in this, and in other classes in which he competed, made quite a sensational climb, covering the measured distance in 23⅘s.

Class V. was for any machine up to 350 c.c. Results on time:

EXPERT CLASS.

		Bore and stroke.	Time.
1.	J. P. le Grand (2½ Singer)	69 × 93	27⅕s.
2.	W. F. Newsome (2¾ Douglas)	60.5 × 60	31s.
3.	C. Williams (2¾ A.J.S.)	74 × 81	33⅖s.

GENERAL CLASS.

1.	W. A. Jacobs (2½ Singer)	69 × 93	29⅕s.
2.	M. Anderson (2¾ Humber)	60.75 × 60	29⅖s.
3.	H. A. Fordham (2¾ Douglas)	60.5 × 60	31⅖s.

Fordham wobbled somewhat badly half-way up the hill, but recovered himself.

Class VI. was for any machine with an engine not exceeding 500 c.c. Results on time:

EXPERT CLASS.

		Bore and stroke.	Time.
1.	J. Cocker (3½ Singer)	85 × 88	24⅖s.
2.	S. T. Tessier (3½ Bat)	90 × 77.5	26s.
3.	W. F. Newsome (3½ Triumph)	85 × 88	25⅕s.

General view at the starting line of the Streatham and District M.C.C. Hill-climb, Up-Park Hill, near Petersfield, showing competitors' machines lined up by the roadside.

Streatham and District M.C.C. Open Hill-climb.

GENERAL CLASS.

		Bore and stroke.	Time.
1.	F. Lamb (3½ Premier)	85×88 ...	27s.
2.	R. L. Keller (3½ Triumph) ...	85×88 ...	27⅘s.
3.	W. D. Hawkes (3½ Ixion) ...	85×88 ...	30s.
	S. R. Axford (3½ Martin) ...	85×88 ...	30s.

Olsson's Ariel in this class appeared to be overgeared.

Class VII. for any machine up to 1,000 c.c. Results on time :

EXPERT CLASS.

		Bore and stroke.	Time.
1.	G. Griffith (two-cyl. 7 Zenith)	90×77.5 ...	22⅘s.
2.	J. Cocker (3½ Singer)	85×88 ...	24⅘s.

The steam tractor which delayed the start being assisted by a little extra power.

GENERAL CLASS.

		Bore and stroke.	Time.
1.	E. L. Buchanan (two-cyl. 3½ Imperial)	70×64.5	28s.
2.	S. R. Axford (3½ Martin) ...	85×88 ...	31⅖s.
3.	F. W. Carryer (3½ Regal-Green)	85×88 ...	33⅖s.

Class IX. for cycle cars up to 1,100 c.c., results on No. 1 formula, was run off next. Each entrant ran in both the expert and the general classes. Nash and Bartlett both made good ascents on each occasion. Martin travelled slowly owing to having recently fitted two new pistons which were not run in, while Halsall suffered from misfiring. Results :

EXPERT CLASS.

		Fig. of merit.
1.	A. G. F. Nash (G.N.)	6473
2.	L. Martin (Singer)	4966
3.	Bartlett (Morgan)	3983

GENERAL CLASS.

		Fig. of merit.
1.	A. G. F. Nash (G.N.)	5663
2.	— Bartlett (Morgan)	5014
3.	L. Martin (Singer)	4927

Class X. was for variably geared touring machines with engines up to 1,000 c.c. Results on formula No. 2 :

EXPERT CLASS.

		Fig. of merit.
1.	C. Williams (A.J.S.)	4506
2.	G. Griffith (Zenith)	2205

GENERAL CLASS.

		Fig. of merit.
1.	C. Williams (A.J.S.)	3996
2.	J. C. Bateson (Douglas)	3848
3.	T. Meeten (Rudge)	3789

The last event to be run off was Class VIII. for sidecar combinations. The weight of the passenger had to be not less than ten stones. Results on formula No. 1 :

EXPERT CLASS.

1. G. Griffith (Zenith sc.).

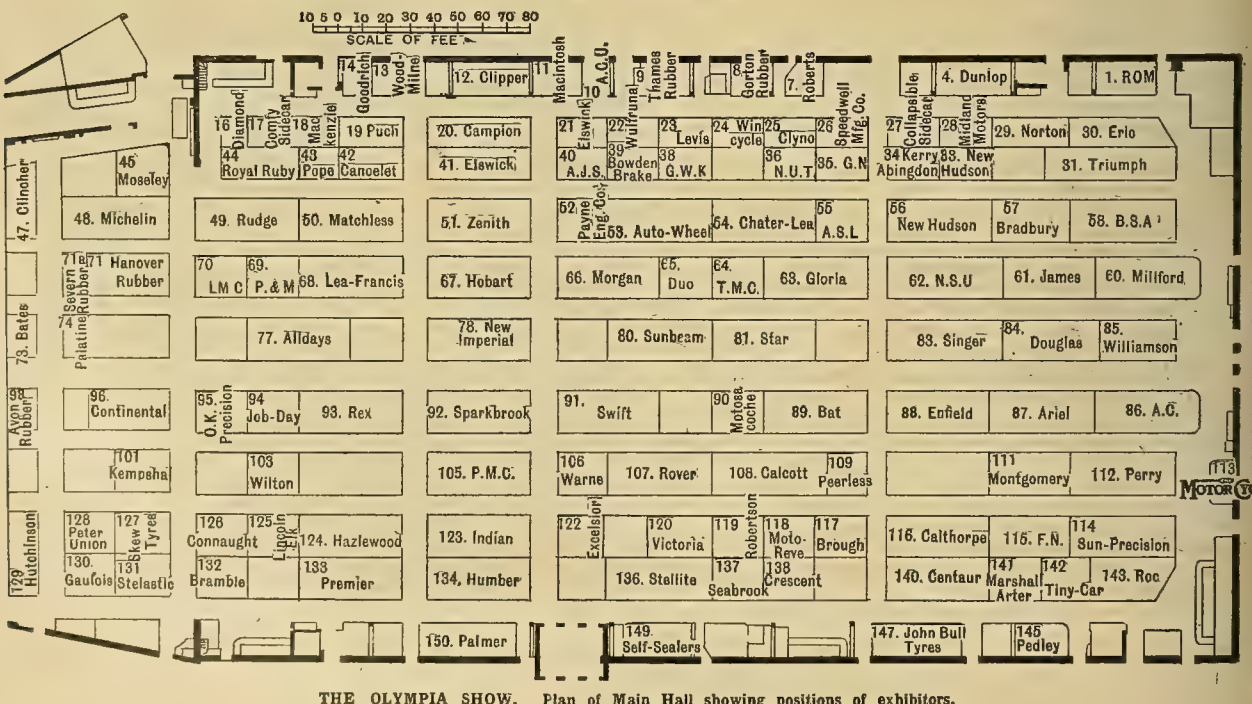
GENERAL CLASS.

1. C. Pattison (Rudge sc.).

Griffith came up at a tremendous pace, and took the corner at the bottom in magnificent style.

J. C. Bateson (Douglas) was the winner of the Pillett Cup for best private owner's performance as a member of the Streatham Club, and G. Griffith made fastest time.

The timekeepers were Messrs. T. D. Dutton and A. J. Wakeford. The formula results were worked out by Mr. F. L. Bassett, the clerk of the course and secretary.

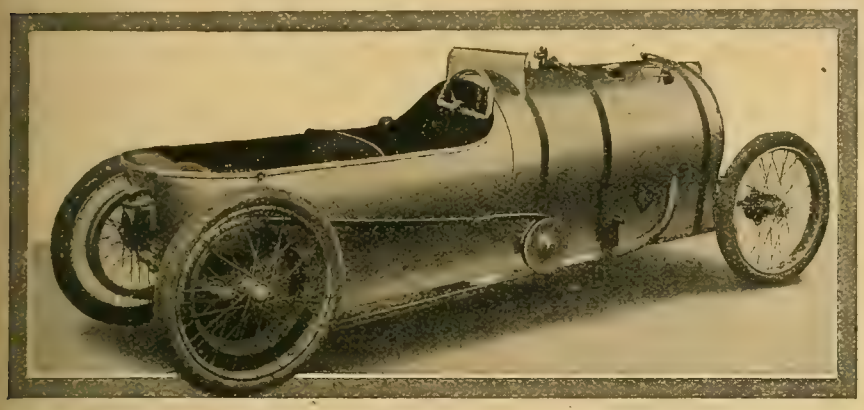


THE OLYMPIA SHOW. Plan of Main Hall showing positions of exhibitors.

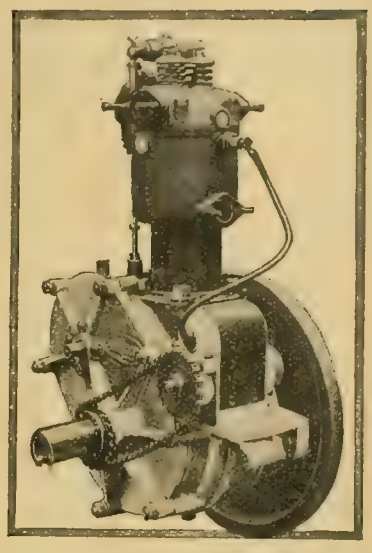
A Water-cooled Cycle Car Engine.

MR. J. F. BUCKINGHAM, of Spon St., Coventry has just added a new engine to his previous models. The engine is exactly the same as those fitted to the Chota cycle cars, but has a water-cooled cylinder and head. The head is made separately from the cylinder casting, and is held down by studs, the overhead valve gear is retained, also, of course, the Buckingham patent valve, which is designed to prevent the head falling into the cylinder in case of breakage. The water spaces are ample, and the outlet is arranged to permit of thermo-syphon cooling.

We hear that on test the engine is giving most satisfactory results and produces great power. We examined all parts of the engine, and it struck us as a very sound, straightforward piece of work. We hear that a complete cycle car is to be marketed by the firm under the name of the Buckingham, which will be similar to the Chota in all respects.



A racy cycle car fitted with a Buckingham engine and special tandem seated body.



The new Buckingham engine showing water joints, overhead valve gear, etc.

(1) C. T. Newsome (Rover). (2) J. D. Morrison (Bat-Jap) passing less fortunate competitors on Gastack Beck. (3) H. G. Dixon ascending Greyhound Hill, Kendal, on one of the new 3½ h.p. twin James machines.

THE MEMORABLE A.C.U. SIX DAYS TRIALS.

AN EXPERT-BARRED OPEN HILL-CLIMB.

We often hear nowadays that the genuine amateur has very little chance of distinguishing himself in hill-climbs when pitted against the factory expert, and if he has a class to himself his deeds are overshadowed by the more dashing performances of the professional. But the Mersey Motor Club is going to give the amateur an afternoon all to himself on September 13th, when it is holding an expert-barred open hill-climb at Pen-y-ball Hill, Holywell, North Wales, at 2 p.m.

The following classes on both time and handicap will be decided, and a competitor entering for any handicap class must enter for the same class on time.

1. Machines up to 350 c.c.
2. Machines between 351-500 c.c.
3. Machines between 501-750 c.c.
4. Machines between 751-1,000 c.c.
5. Passenger machines up to 500 c.c.
6. Passenger machines between 501-750 c.c.
7. Passenger machines between 751-1,100 c.c.

Handsome prizes will be awarded, and it is to be hoped that amateur riders will seize the opportunity of showing their prowess now the chance is afforded them of so doing. Full particulars may be obtained from the hon. sec., Mr. S. W. Carty, 5, Redcross Street, Liverpool.

STOCKPORT AND DISTRICT M.C.C. FIRST OPEN HILL CLIMB.

THE first open hill climb took place on Saturday last at Axe Edge, a 1 in 8 gradient on a broad smooth road with only two bends, and one and a quarter miles in length. F. S. Whitworth (Douglas) went off first, but only got half way, as his timing gear stripped; this took a lot of the interest out of the lightweight classes, as W. Heaton (A.J.S.) had it all his own way in these classes and won all three. H. Scale, riding a machine of his own make, with 3½ h.p. overhead J.A.P. engine, also won three classes.

Ten classes were run off, all on time, and the climb was over by 5.30 p.m. Brewin (8 Zenith) had a burst front tyre at speed in the 1,000 c.c. class and fell, unfortunately breaking his collar bone; in the 350 c.c. class W. Bently, a club member, also came off, and cut his head badly. These two unfortunates were both left at the local cottage hospital. Results:

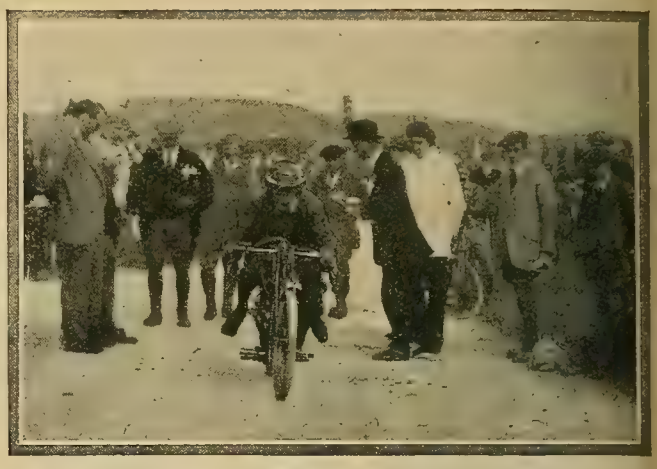
CLASS 1.—Touring machines up to 350 c.c.
1. W. Heaton (A.J.S.) ... ... 1m. 17⅗s.
2. J. Collier (Douglas) ... ... 1m. 37s.

CLASS 2.—Touring machines up to 600 c.c.
1. R. M. Davey (3½ Norton) ... ... 1m. 30s.
2. S. Phillipps (3½ Triumph) ... ... 1m. 55s.

CLASS 3.—Racing machines up to 350 c.c.
1. W. Heaton (2¾ A.J.S.) ... ... 1m. 26⅗s.
2. H. J. Scale (2½ Veloce) ... ... 2m. 33⅕s.

CLASS 4.—Racing machines up to 500 c.c.
1. H. J. Scale (3½ Scale-Jap) ... ... 1m. 19⅕s.
2. J. Smith (3½ Triumph) ... ... 1m. 25⅕s.

CLASS 5.—Racing machines up to 750 c.c.
1. H. J. Scale (3½ Scale-Jap) ... ... 1m. 15⅕s.
2. R. Birkett (3½ Triumph) ... ... 1m. 21s.



Scene at the Stockport M.C.C. Hill-climb, F. S. Whitworth (Douglas) starting.

CLASS 6.—Racing machines up to 1,000 c.c.
1. J. Gookson (8 Matchless) ... ... 1m. 10s.
2. H. Marsden (8 Matchless) ... ... 1m. 11⅕s.

CLASS 7.—T.T. machines up to 350 c.c.
1. W. Heaton (A.J.S.) ... ... 1m. 25s.
2. E. Woods (Levis) ... ... 1m. 51s.

CLASS 8.—T.T. machines up to 500 c.c.
1. H. J. Scale (3½ Scale-Jap) ... ... 1m. 15s.
2. W. Heaton (2¾ A.J.S.) ... ... 1m. 22⅖s.

CLASS 10.—Racing passenger machines up to 600 c.c.
1. H. Bottoms (3½ Triumph) ... ... 1m. 47⅕s.
2. J. Smith (3½ Triumph) ... ... 1m. 50⅗s.

STOCKPORT AND DISTRICT M.C.C. HILL-CLIMB.

(1) W. Heaton (2¾ h.p. A.J.S.) who won three events.

(2) H. J. Scale (3½ h.p. Scale-Jap), who also secured three firsts.

RACING AT PORTMARNOCK.

The Dublin and District Motor Cycle Club held a race meeting at Portmarnock on Saturday. The chief event was a hundred mile handicap, and there were two scratch races for light and medium powered machines respectively. In view of the fatalities that took place at the last meeting, special precautions were taken to avoid any accidents, and these were in every way effective. The sands were not in their usual good condition, and as numerous water courses had to be crossed during the races belt slipping and ignition troubles were numerous. Indeed, in the 100 miles race no competitor made a clean run. Results:

TWO MILES SCRATCH (350 C.C. MACHINES).

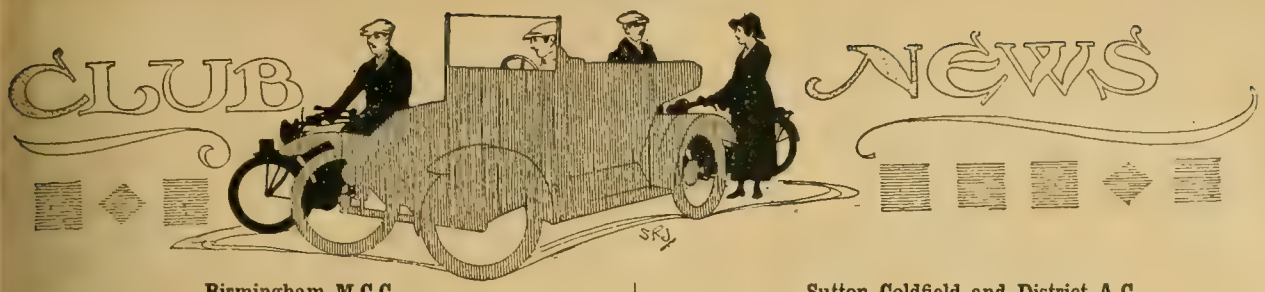
	Rider and machine.	m.	s.
1.	W. J. Towell (2¾ Douglas) ...	3	2⅖
2.	J. Healy (2¾ Sunbeam)	3	5

A very fine race, each of the men leading in turn.

TWO MILES SCRATCH (500 C.C. MACHINES).
1. C. B. Franklin (3½ Indian) 2 19⅘
2. F. J. Walker (3½ Rudge) 2 27

HUNDRED MILES HANDICAP C.C. UNLIMITED.

	Rider and machine.	H'cap.	h.	m.	s.
1.	C. B. Franklin (3½ Indian) ...	9m. ...	2	8	27
2.	W. H. Curtis (3½ Indian) ...	11½m. ...	2	11	30



Birmingham M.C.C.

Owing to the continued growth of the club, it has been found necessary to appoint Mr. B. C. Otley, 115, Colmore Row, Birmingham, as permanent secretary to the club, and all communications should in future be addressed to him.

Cumberland M.C.C.

The result of the hill-climb held at Greenhead has now been announced.

Singles.—1, E. F. Gilbanks (3½ Rover), 45⅖s.; 2, J. W. Moffat (3½ Singer), 48s.

Twins.—1, A. I. Moffat (5-6 Zenith), 43⅘s.; 2, P. N. Gilbanks (2¾ Douglas), 57s.

Nottingham and District M.C.C.

By the invitation of Lord Henry Bentinck a run was recently made to Underley Hall. The return journey was *viâ* Skipton and Harrogate.

Westmorland M.C.C.

A hill-climb was held on the 28th ult. at Underbarrow Scar, a few miles from Kendal. There were classes for lightweights, singles, and twins. The hill is a fairly long one, very steep in parts, and has several difficult corners. Results:

Lightweights.—1, R. M. Chaplow (2¾ Humber); 2, H. Jackson (2¾ Sunbeam).

Singles.—1, G. W. Braithwaite (3½ Zenith); 2, J. Braithwaite (3½ Braithwaite).

Twins.—1, A. I. Moffat (6 Zenith); 2, B. Jeffreys (8 Zenith).

The fastest time in the event was made by A. I. Moffat, who went up in 48⅗s.

Glasgow M.C.C.

The results of the recent 100 miles non-stop trial of the Glasgow M.C.C. are now to hand, being as follows: Special awards—Solo, R. G. McGibbon (3½ Edmund); passenger, T. S. V. Phillips (5-6 A.J.S. sc.) Gold medals.—W. Deans (3½ Ariel), W. Dickie (5-6 F.N.), W. B. Cramb (3½ Elswick), G. Taylor (3½ Rudge-Multi), R. Black (5-6 F.N.), A. D. Morrison (3½ Ariel), and W. Carlaw (6 Enfield sc.)

Sutton Coldfield and District A.C.

On October 3rd, an open motor cycle and sidecar reliability trial will be held for the Levis Cup, and cyclecars will compete for the P. J. Evans Cycle Car Trophy. Competing machines in the latter event must comply with the A.C.U. definitions. Both these trophies must be won three times in succession before becoming the absolute property of the winner. Full particulars may be obtained from Mr. F. W. Finnemore, 122, Colmore Row, Birmingham.

The Speed Trials at St. Andrews.

Chief interest in Scotland is at present centred in the championship meeting, to be held on the sands at St. Andrews on Saturday next. While naturally the minor classes will attract attention, the three championships for lightweights, medium weights, and heavy weights are the most coveted honours. Seventy-five riders have notified their intention of taking part. Apart from local experts, a few of the more notable exponents from other districts are competing, among others being Hugh Mason (2¾ N.U.T.), and E. W. Cheshire and S. Crawley, both on Triumphs. The Scottish Auto Cycle Union, which has charge of the event, is leaving no stone unturned to make it a huge success. The sands at the Fifeshire watering place are admirably adapted for a contest of this nature.

Members of Nottingham and District M.C.C. at Underley Hall, the Westmorland seat of Lord and Lady Henry Bentinck, who are seen in the centre at back of group. Lord Henry is the Nottingham club's president, and he invited the members to spend a week-end at Underly Hall.

FORTHCOMING OPEN EVENTS.

Liverpool A.C.C.

The Reliance Cup open trial will be held on the 28th inst. over a course in North Wales. Entry forms and particulars may be obtained from Mr. S. W. Phillpott, 1, Oakdale Road, Mossley Hill, Liverpool.

ANOTHER PUNCTURE SEALING COMPOUND.

We recently had an interesting demonstration of Filibuster, a tyre stopping liquid sold by Messrs. Stanley Feast and Co., at the premises of that firm in Steedman Street, Walworth Road, S.E. Filibuster is a white liquid, which is injected through the valve into the inner tube. When shaken up by the revolutions of the road wheel it will effectually seal up any puncture of reasonable size that may occur. In the demonstration, which was carried out on the tyres of a carrier tricycle, first of all a pin, then a bradawl, and later a 2in. nail, were driven through the cover into the tube. The result was an immediate air leak, but when the tyre was spun round the orifice automatically closed itself. To be effective a tube must, of course, be in its natural position inside the cover, as it must have some wall or hard substance against which to abut, otherwise the clogging action will not take place. A tube filled with Filibuster, for instance, will not be self-sealing if blown out and punctured when removed from the cover. The test was carried out satisfactorily.

Question & Replie

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Tour to the West.

I propose going from Reading to Bude in North Devon, and am writing to ask you whether you could give me a favourable route. I have sketched the following route as far as Exeter. Can you suggest anything better? Reading, Newbury, Andover, Salisbury, Shaftesbury, Yeovil, Chard, Honiton, to Exeter. I am wondering how to get from Exeter to Okehampton and thence to Bude. Would Reading to Exeter be a fair day's run with three up and a large portmanteau on a 6 h.p. twin Enfield? —S.A.S.

It would be more direct if you went through Reading, Aldermaston, Kingsclere, to Whitchurch, and then by the route you have given. From Exeter to Okehampton it is better to go by Crediton and Bow than by the direct road, which is somewhat rough. Thence your road lies through Hatherley, Holsworthy, and Stretton to Bude. The total distance would be approximately 200 miles. Reading to Exeter would be a good day's run, but you could probably do it if you started early.

Water Cooling Difficulties.

I should much appreciate your advice on the following matters: My motor cycle is a 3¾ Green-Precision, water-cooled, which has been used only a few hundred miles solo. I find there is almost constantly a knocking noise, but I cannot trace it. This noise is very much like the knock of a lightweight, and it occurs on the level as well as up hills, but ceases when the magneto spark is retarded two-thirds. The top gear is 4¾ to 1. I am told that this noise is common in overhead valve engines, but it seems strange that it almost ceases and is very much less accentuated with a retarded spark. There is also something wrong with the cooling system. The water around the cylinder gets intensely hot, while that in the tank remains cold. The unions and pipes have been both properly examined, and there is no obstruction. When the water is very hot it spurts out of the small hole in the filling cap in short jets at long intervals, and the jacket is so hot that it is almost impossible to keep the hand upon it.—D.A.

It is very difficult with the information which you send us to diagnose the complaint from which your engine is suffering, but you have certainly been misinformed if you think that an overhead valve engine is more likely to knock under normal conditions than one fitted with side by side valves. The symptoms you mention rather tend to make us think that you are driving with the ignition too far advanced. The timing should be arranged as follows: Retard the ignition fully and see that the points of the contact breaker are separating at the moment when the piston reaches the top of the stroke. This is a good general rule for timing, though, as your engine is fitted with a higher compression than normal, it is possible that it will stand slightly more advance, say, 2 mm., before the piston reaches the top. With regard to the water-cooling system, as long as the temperature does not rise above 200° F. you have nothing to worry about. The water in the little tank will naturally remain cool, as this is not in circulation, and is merely used in these engines to keep up the supply through evaporation in the cylinders. Do not fill this little tank more than half full, and you will find that the spurting you complain of will cease.

Dumfries to London.

I would feel obliged if yo could let me know the best rout to take on my 3 h.p. Lincoln-El fixed engine motor cycle fro Dumfries to London, also statin how many miles the journey is, and th best places to stay the night? I a not a fast rider, so I think I ought t do the journey in two or three day I was thinking I would go to Bradfor but if you could give me the best an least hilly road from Dumfries to Lo don I would be very grateful.—G.W.

Your best route would be as follows Dumfries, Annan, Longtown, Brampto Alston, Middleton-in-Teesdale, to Scot Corner. The route from Longtown Scotch Corner is hilly, but, despite thi we strongly advise it. From Scot Corner go straight down Leeming La to Boroughbridge, then continue throu Wetherby, Aberford, Ferrybridge, Do caster, Retford, Tuxford, Newa Grantham, Stamford, Stilton, Eat Socon, Baldock, Stevenage, Hatfie Barnet, to London. After Scotch Corn there is no real hill on the rou This route is the very best, as it avoi all big towns. If you wish to through Bradford you must make

A.C.U. SIX DAYS' TRIALS.
J. A. Neumann (5-6 h.p. Rudge) in the waters plash on Bollihope Common above Stanhope.

Carlisle, and then go through Penrith, Kendal, Kirkby Lonsdale, Ingleton, Settle, Keighley, to Bradford. To avoid Leeds go back to Otley, joining the Great North Road just south of Wetherby. You could spend the first night at Bradford or Boroughbridge, according to which route you take, and the second night at Buckden.

Silencer Regulations.

I have just had the disagreeable experience of appearing in our local police court (Leamington Spa) to answer the charge of riding a motor cycle with the "silencer cut-out" open, or, in the words of the summons, as I "unlawfully did drive a motor car (motor bicycle) propelled by an internal combustion engine on a certain highway and did use on such motor car a device which allowed the exhaust gases from the engine of such motor car to escape into the atmosphere without first passing through a silencer expansion chamber or other contrivance suitable and sufficient for reducing as far as may reasonably be practical the noise which would otherwise be caused by the escape of the said gases contrary to the L.G.B. amending regulation, Art. 11 (7) of the 19th day of November, 1912, made in pursuance of the statute in such case provided." The policeman acknowledged that the machine was not noisy, but all the same I and five others were reprimanded by the Mayor and had to pay costs, in each case 4s. 6d. I contend that the fact of having a silencer and discharging the exhaust gases into same complies with the Act, and, if I am wrong, will you be good enough to correct me? Up to the present, I thought the Act was framed to stop those inconsiderate riders who ride with a direct cut-out on the exhaust pipe and progress like a Gatling or Maxim gun, and I did not take the silencer cut-out to be the one aimed at.—A. POTTERER.

We are under the impression that the usual standard type of motor cycle silencer, in which the gas is first passed through an expansion chamber, would comply with the Act, but if the cut-out on the silencer were open and the machine were making an undue noise, then we think you would be liable. If the policeman acknowledged in court that the machine was not noisy, we think you were unfairly convicted. The Act was certainly framed to stop riders of motor cycles from making an undue noise, and the working of the Act is rather vague. However, as we interpret it, provided the gas first passes through an expansion chamber before issuing into the air, and does not make an undue noise when the cut-out is open, riders cannot be summoned purely for the use of a cut-out. It is quite possible that in their endeavours to stamp out noisy machines, the Benches throughout the country will interpret the Act differently, and it behoves motor cyclists to render their machines as silent as possible, *i.e.*, to ride them with the cut-out closed when riding through towns or villages, and when meeting or overtaking horse traffic. We have obtained a legal opinion concerning the matter; this practically confirms what we have already written.

Ignition Troubles.

I have an old make Bat machine, 3 or 3½ h.p., accumulator ignition, two accumulators, about 15 amps. each. These, to me, are a continual source of anxiety, lest they should run out. And I do not seem to be able to get much above fifty miles out of each, when fully charged, so that a long journey is out of the question, as they take so long to recharge. I do not want to spend too much over the machine, as I am afraid that if I go to the expense of fixing a magneto, it might not increase the value of the machine to that extent when I want to part from it for a more up-to-date one. This is my first season at the game. Would you advise me to get a dry battery, if so what make? I am not riding every day, and I suppose that the dry batteries do not run down when not in use. I have an ordinary trembler coil in the box with the accumulators; should I have to get a special kind for the other? I fitted a switch, so that I make a practice of switching off the spark immediately I finish running. What mileage would I be likely to get out of a dry battery with my present coil? The engine is in good condition.—J.P.M.

It is rather difficult to know how to advise you. Of course, if you can buy a second-hand magneto at a cheap price it is well worth fitting to your machine provided you intend to keep it, but, of course, if you were selling it soon you would not recover the value of the magneto. A dry battery is perfectly satisfactory, but works with a plain make and break and not a trembler. Dry batteries last different distances. You might, perhaps, get 1,000 miles, perhaps not so much. They deteriorate all the time, but deterioration is slow with a good make. We think the best thing would be, if you can see your way to do so, to fit a magneto.

READER'S REPLY.

Fitting Nail Catchers.

I notice in *The Motor Cycle* of August 21st that "P.T." requires a reliable nail guard for his motor cycle. I can speak with great confidence of the merits of the Chemico nail guard. I have used one of these guards for over two years on my motor cycle, and, although I have done a large amount of riding, I have never once been detained by a single puncture. I feel, therefore, that I can recommend this article as being absolutely dependable. It is adjustable and easily fitted.—G. P. WILKS.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"S.F.B." (Purley) — 1913 two-stroke Levis.

"R.M.W." (Didsbury).—1912 Humber 2 h.p. single-speed for town use.

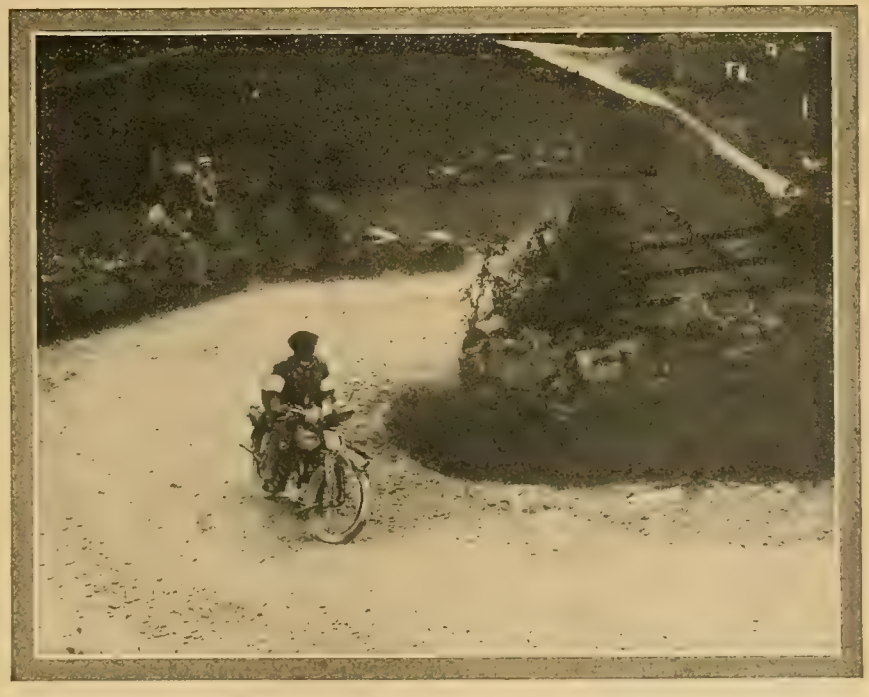
"H.L." (Newport, Mon.)—A.C. Sociable and Morgan runabout. Speed, reliability, consumption and comfort.

"N.S." (Coventry). — A.S.L.-Precision. Reliability and comfort of cushion seat, model 1913.

"H.R.H." (Birmingham).—Three-speed hubs and three-speed counter-shafts, chain and belt. Which preferable?

"W.A.G." (Coatbridge).—1913 Rover, 3½ h.p., with Armstrong Mark VI., or Sturmey-Archer gears. Reliability and petrol and oil consumption.

"W.H.B." (Watford).—Clyno and side-car. Hill-climbing, consumption, flexibility, and accessibility of engine. Also Kempshall tyres.



A.C.U. SIX DAYS' TRIALS.
L. Newey (3½ h.p. Ariel) rounding one of the corners on Silver Hill, near Keld included in a non-stop section.

Catalogues Received.

We have received a copy of the latest catalogue of Wulfruna motor cycles, which sets forth admirably the various points of this machine.

Chains for Passenger Machines.

Hans Renold, Ltd., Manchester, are bringing out a new ½in. pitch chain of 4,300 lbs. strength, which is specially made for transmissions on sidecars and cycle cars.

Business Announcement.

Mr. Harold Williamson, of the Harold Williamson Motor Co., is very shortly going out to Canada to open a motor business there. He has our best wishes for success in his new venture.

Druid's New Address.

We are informed by Messrs. A. Drew and Co., makers of the celebrated Druid front forks, that expansion of their business has necessitated the removal of the firm to larger premises, and that in future their address is Druid Works, 27-29, Leopold Street, Birmingham.

Autolettes Abroad.

The Enfield Autocar Company have lately shipped "Autolettes" to Penang, Singapore, Dunedin (N.Z.), Calcutta, Madras, Colombo, Adelaide (S.A.), as well as to several parts of the Continent.

Dutch Trial Tyre Successes.

In the Anglo-Dutch trial, four gold medals, seven silver medals, and four special awards were won by riders using Dunlop tyres or belts. The special awards included the Manufacturers' and Traders' Union trophy for the best performance by an English private owner, and the N.M.V. Plaque d'Honneur.

A Successful Concern.

We are informed by Bradbury and Co., Ltd., Oldham, that they have had a most successful financial year, the profits being £7,327 2s. 7d. The preference shares receive a dividend of ten per cent. and the ordinary shares five per cent., and £2,283 12s. 3d. is carried forward.

F.N. Improvements.

We are informed that the carburetter of the 2½ h.p. F.N. machine will, in future, be fitted with an auxiliary air valve similar to that on the 1913 5 h.p. four-cylinder model. Amongst other refinements on the latest 2½ h.p. F.N. is a tubular carrier, which pivots backwards with the rear mudguard when one nut is unscrewed. This enables the tyre to be got at readily.

Lubrication.

The makers of the B. and L. forced sight drip lubricator, Messrs. Best and Lloyd, Ltd., Cambray Works, Handsworth, Birmingham, inform us that their lubricator has been adopted as standard for 1914 by the Triumph Cycle Co., Ltd. This lubricator (which has been illustrated and described in these columns) consists of a pump and sight feed glass barrel. The pump is filled by hand and the oil automatically fed through the sight feed glass by the pressure of a coiled spring, which empties the pump gradually, according to the adjustment of a needle valve. A complete pumpful can also be given at any time by means of the hand pump without disturbing the automatic part of the sight feed drip.

SMALLETS

A Treatise on Chain Drive.

The booklet entitled "The Renold Roller Chain Tooth Form," by Mr. Hans Renold, and published by Hans Renold, Ltd., Brook Street, Manchester, is a very interesting publication, and is well worth a study by those interested in chain drive.

Hub Gears in the Six Days Trials.

Armstrong gears were very successful in the recent A.C.U. Six Days Trials at Carlisle. The winning Ariel team were so fitted this year, as was also the 3½ h.p. Premier, ridden by W. B. Little, one of the English team in the International competition incorporated in the Trials.

Satisfactory Belt Service.

The Midland Rubber Co., Ltd., Ryland Street, Birmingham, have long been famous for the excellence of their manufactures. Their rubber belts are admirable, and one of our contributors has just written us his experiences with one of these fitted to his 6 h.p. Zenith. He has now run 1,150 miles, almost all of which distance has been covered with a sidecar, and up to the present not the slightest trouble has been experienced with the belt. Furthermore, he has not even shortened it, and after such a test it speaks well for the excellent construction of these belts.

Victor Tyre's Showrooms.

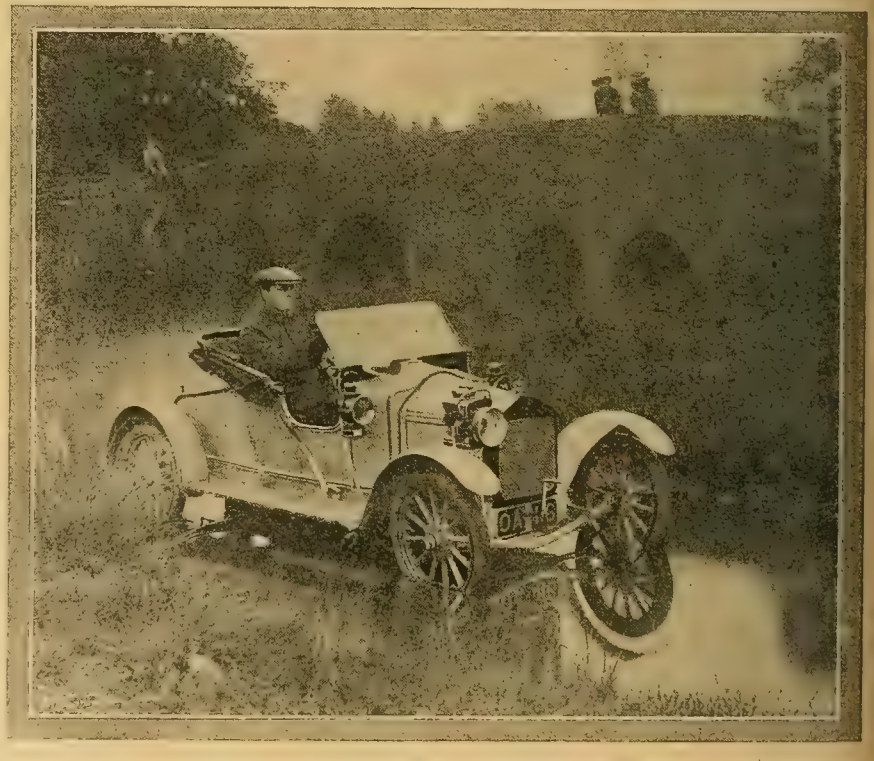
The Victor Tyre Co., Ltd., inform us that they have opened West End showrooms at 15, Carteret Street (near Buckingham Gate), Westminster, S.W., where all clerical business will in future be transacted, and where tyres will be fitted to customers' vehicles.

The Alpha London Agency.

Messrs. Sydney Westall and Co., Ltd., automobile engineers, 143-145, Great Portland Street, W., inform us that they have taken over the agency of the Alpha engine manufactured by Messrs. Johnson, Hurley and Martin, Ltd., of Coventry, which was described in our issue of the 14th August.

Rustproof Enamel.

Messrs. Pellolit, Ltd., 265, Strand, W.C., are responsible for the introduction of Pellolit. This is a sort of enamel which is applied to metals by means of the stoving process, which is perfectly proof against rust, does not chip, and, at the same time, possesses the excellent quality of being an insulator both against extremes of heat and cold, and also electricity. It is elastic and is built up in layers on the surface of the metal. One of its uses has been for the receivers of telephones, and we have seen some excellent examples of these receivers treated in this manner, one of which has been subjected to a heavy blow. Although at the actual point of contact the preparation was removed, it was shown by the presence of several curved marks that the material had endeavoured to follow the course of the dent, clearly proving that under ordinary circumstances Pellolit will not chip or crack, even under rough treatment.



THE NEW STELLITE CYCLE CAR FORDING A STREAM.
This illustration gives an idea of the ground clearance of the new Stellite cycle car described on pages 1134 and 1135 of our last issue.

MATCHLESS

1913 SIX DAYS' TRIAL.

Class I. (Sidecars).

15 machines started — 5 finished, 3 of these being "MATCHLESS" SIDECARS,

which made the best individual as well as aggregate performances, gaining

GOLD, SILVER, and BRONZE MEDALS,

and furnishing the passenger machines of the team that won the 200 GUINEA INTERNATIONAL TROPHY.

Newland Hause. "Excellent."
Kingsdale Hill. "Really good."
Tan Hill. "Makes light of it."
Pent Hill. "Up magnificently."
Hollin Bank. "Never slows for a moment."

A few Press comments on the Matchless in the Trials.

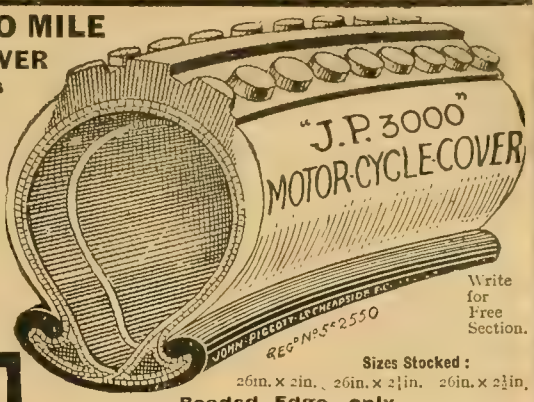
The 'J.P.' 3,000 MILE MOTOR CYCLE COVER

The Cover that HAS stood the Test.

TESTIMONIAL.

BARNSLEY, June 13th, 1913.
Dear Sirs—Please send per return, two 26 × 2¼in. motor cycle covers, for which I enclose P.O.O. for £3. The last cover I got from you has now done over 2,800 miles, and is the first tyre I have had to do so much on my back wheel.



Write for Free Section.

SEND FOR ILLUSTRATED MOTOR CYCLE LIST No. 147 POST FREE.

YOUR LOCAL AGENT will not advise you to buy a 'J.P.' 3,000 Mile Tyre for

30/-

BECAUSE you must deal direct.

'3,000 MILES' for 30/- allows for no **INTERMEDIATE PROFITS.**

Sizes Stocked:
26in. × 2in., 26in. × 2¼in. 26in. × 2½in.
Beaded Edge only.

This cover is made on the same principle as a heavy motor car tyre, viz., under hydraulic pressure, and not as the usual motor cycle covers which are usually a glorified cycle tyre. It is composed of the best Para rubber, and fitted with a new non-skid tread which has been thoroughly tested and found to be an absolute preventative of skidding. **We are so confident of the wearing properties of this tyre that we are guaranteeing it for 3,000 Miles.**

A Written Guarantee enclosed with every Cover as follows: **30/-** **Guaranteed 3,000 MILES. With or without sidecar.**

117-118, Cheapside And MILK STREET, LONDON, E.C.

LUKIN
Single Control Carburetter

Read this convincing letter from a——————

"SCOTT"

rider, and the wonderful results obtained with a LUKIN Single Control Carburetter.

Dear Sirs, May 1st, 1913.

I have nothing but satisfaction and pleasure to express as the result of several hundred miles of trial of the LUKIN Carburetter on my "Scott" motor cycle.

I have got between 75 and 80 m.p.g. on it with the LUKIN.

The flexibility which the LUKIN has given me with the "Scott" engine is most satisfactory. I can drive entirely on single throttle lever and acceleration after turning corners on the level, and on hills is quicker and more certain than anything I have experienced with a motor cycle.

To-day I have driven my "Scott" from Dorking to Coldharbour with the steep gradient and continuous hill of 4 miles, on the top gear all the way, and never below 18 to 20 m.p.h., without the slightest sign of the engine faltering.

I am, yours faithfully, (Sgd.) name on application.

Riders of the "SCOTT" or any other motor cycle cannot follow a wiser course than fit the Lukin carburetter. It completely transforms the running of the engine and entirely eliminates the drawbacks of the old double control system.

It imparts the flexibility of a Car to a Motor Cycle.

Full particulars from—

£10-10-0

Ten guineas is all it costs to bring your mount up-to-date by the addition of the

1913½ ROC

SIDECAR PATTERN

Two-speed Gear.

(6 Days' World's Sidecar Record type)

The 1913½ big clutch type has been designed expressly for passenger work.

It solves all gear worries and guarantees you satisfaction.

The 1913 Roc gear was already recognised the last word in motor cycle gears for solo use.

The 1913½ big clutch type is just what thousands of "sidecarists" have awaited and expected.

The Roc gear was the first of all motor cycle gears—it is the first to-day. Nothing could be smoother, easier to operate, or be more reliable.

No better investment for the money is possible than in this 1913½ Roc dependable gear, fitted complete for ten guineas.

Write for particulars, stating make and h.p. of your machine.

No delay in delivery.

ROC GEAR Co.,

HAYMILLS, BIRMINGHAM.

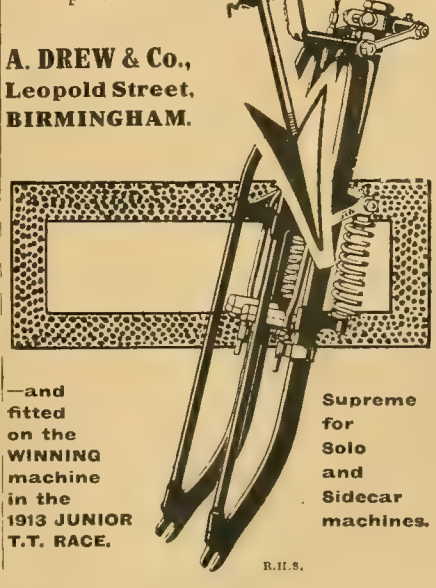
—the proved PERFECT Spring Fork

—It's the SCIENTIFIC DESIGN and PERFECT SPRINGING principle which places "The Druid" so far ahead of any other Spring Fork—that's the reason why it is adopted on the leading machines of the day—and the fact that it

was fitted on the majority of winningmachines in the A.C.U. SIX DAYS' TRIALS

is proof of its supremacy. —The "Druid" eliminates all vibration, bouncing and road shock—ensures perfectly true steering—admits of no side-play whatever—and is *completely* effective in promoting the rider's perfectcomfortandsafetyawheel —The "DRUID" can be fitted to any existing machine qu'te easily — write for "Booklet" containing full particulars.

A. DREW & Co., Leopold Street, BIRMINGHAM.



—and fitted on the WINNING machine in the 1913 JUNIOR T.T. RACE.

Supreme for Solo and Sidecar machines.

ESTABLISHED 20 YEARS "IN THE HEART OF THE TRADE"

In the buying and selling of Motor Cycles it is always the constant endeavour of the Colmore Depot to maintain their unrivalled reputation for

CLEAN HANDS

For twenty years they have held this reputation, first in pedal cycles and now in motors. There is no necessity for the buyer to heed the legal maxim, "Caveat emptor" ("Let the buyer beware"). He can place himself in the hands of the Colmore well knowing his confidence will not be abused. The **Colmore Policy** of only employing **experts** and **specialists** in each department guarantees the **satisfaction** of the customer. Every machine below is destined to become a Colmore advertisement.

TO CARRY ONE (TWO PERHAPS SOMETIMES).

CASS'S.—All makes, new and second-hand, mot cycles and cycle cars supplied, sidecars, tyr accessories; deferred payments.—Cass's Motor Mart, Warren St., W. (opposite Tube Station). Tel.: 36 Mayfair. [13

KERRY-ABINGDON, 3½h.p., 2-speed and fr engine, 1911, splendid condition; £32/10 Knight, Church St., Reigate. [12

SINGER, 2½h.p., 1912½, P. and H. lamp set, rubbe footboards, spares, just overhauled; £22.—8a Westville, Northwood, Middlesex. [X82

CLEMENT-GARRARD, new engine, Hellesen, and B., ideal motocyclette; £7/10.— Brocklebank Rd., Wandsworth. [12

F.N., 4-cyl., splendid condition, just overhauled; powerful; £18, or exchange lightweight.—Pow 28, Norman Rd., Wimbledon. [1

F.N., 6h.p., very fast, splendid order, or exchan good 3½h.p., 2-speed, sidecar, and cash.—Banfi High St., Borough Green, Kent. [1

SCOTT, December, 1911, little used, perfect co tion; what offers? also B. and K. sidecar.— 291a, Oxford St., London, W. [X8

TRIUMPH, clutch, 1912¾, lamp, generator, ho spares, never used, not wanted; seen after 6; £ —121, Upper Clapton Rd., London. [1

1911 3½h.p. Clutch Premier, in splendid co tion; trial; bargain, must sell, £2 Scotchmer, 138, Bath Rd., Hounslow. [1

ROVER, 1912¾, 3-speed, free engine, with spa £38; with unscratched Canoelet sidecar, £47; ac sories, £3.—49, Rushey Green, Catford. [1

MINERVA, 2¾h.p. upright engine, Amac, h new belt, good tyres, perfect; £7; ride awa Baxter, 103, Greyhound Rd., Fulham. [1

4-CYL. F.N., 2-speed, good condition, horn, lamp, cessories, suitable for sidecar; £28, or near offe 4,011, *The Motor Cycle* Offices, Coventry. [X8

BAT, 1912, 2¾h.p., T.T. model, overhead valves, bearing engine, 3 speeds, low built; sacrifice, £ —Moto, 46, Chaucer Rd., Herne Hill, S.E. [X8

BAT-J.A.P., 8h.p., 1912, F.E., Cowey, Lucas h accessories, back seat for passenger, whole perfo cost £70, sell £40.—23a, Greville Rd., Kilburn. [0

1912 Bradbury, 2 speeds, free engine, new ty lamps, etc., ideal sidecar machine, in excell condition; £32.—55, Aytoun Rd., Stockwell. [X8

MOTO-REVE, twin, Druids, Continentals, Whi belt, excellent condition; cheap; bought sid machine.—40, Belleville Rd., Clapham Junction. [1

DOUGLAS, 1913, model O, with lamp and horn, in May, excellent condition; £37; owner g abroad.—Cave-Browne, Folkestone Rd., Dover. [X8

MOTO-REVE 2¾h.p. Twin, 1911, Bosch mag., stud tyres, horn, lamp, tools, very fast, perfect co tion; £16.—Goodship, Elm Rd., Ewell, Surrey. [X8

6h.p. Matchless-Jap, 1910-11, condition as new; gns., or exchange for Triumph and cash.—Baten Norfolk House, Lower Addiscombe Rd., Croydon. [1

3½h.p. Minerva, mag., £11: 3-wheeled chassis, ty and steering, £4; sidecar springs, as new, must sell.—4, The Broadway, Addiscombe, Croydon [1.

TRIUMPH, 1913, 3-speed, done 1,000 miles, spe meter, all accessories, perfect condition; must immediately, offers.—21, Highbury Quadrant, Lon [1

1910 Rex de Luxe, 5-6h.p., 2-speed, free, handle s ing, Bosch, Senspray, Whittle, excellent t Pillion; trial; lowest £25.—17, Argyle Rd., Mile E. [1

6h.p. Matchless, late 1912, twin belts, Chater- family sidecar; £60; any trial; owner buying —Beaubois, 2, Marlboro' Rd., Collier's Wood, Mer S.W. [X7

1912 T.T. Roadster Rudge, bought 1913, O.A B.S.A. carburetter, Miller lamp, knee grips, fect, exceptionally fast; £30.—Hollinghurst, Hornchu Essex. [X8

PREMIER Lightweight, bought from Olympic E bition, only run 200 miles; going in for sid combination; £29/10. — Rose, Clayton Rd., He Middlesex. [1

A.C.U. Trials. The Judges' Report.

SOMEWHAT belated, but none the less welcome, comes the judges' report on the recent Auto Cycle Union Six Days Trials at Carlisle, and perusal of it will well repay the time involved. We think the judges have done well to keep their report as short and concise as possible. Long technical details and explanations are nearly always tedious, and there is a pleasing brevity about this report. The great debated question of the routes selected is hardly referred to, except that the report says that there are many rough roads in the suburbs of London and Paris that are far more trying to the frames and fittings than any of the loose roads in Lakeland.

With regard to faults in the modern motor cycle, the points to which attention is more directly drawn are leaky tanks and badly fitted wire controls. We ourselves saw a good deal during the progress of the trials of these two, and we consider that it is not very much to the credit of the 1913 models that it should be necessary to draw attention to such defects. On many of the best makes such troubles are absolutely unknown, and the hardiest riders could drive them indefinitely without loss of petrol or failure of control wires. The judges very rightly point out that the defective wire controls were the faults of the fitters and not of the material.

The judges, we are glad to say, give a word of appreciation to the general appearance of the riders. We feel sure that this praise is well merited, for we particularly noted a great improvement in this respect over last year. One or two were penalised for carrying tins of oil flopping about attached to their belts. We confess to a little sympathy for the riders so penalised, for carrying a spare tin of oil is an awkward business, especially when the carrier is already loaded. We think makers would do well to try and provide some means of carrying a quart tin of oil on the machines for long-distance touring.

The judges pay great praise to the cycle cars which finished the course, and point out that not only did they get through, but that they finished in excellent condition. They also point out that it was not, generally speaking, the rough roads that caused the great number of retirements among the cycle cars, but usually engine defects. However, the fact that two out of the three successful machines were fitted with air-cooled motors does not point to air cooling being in any way unsatisfactory for this class of vehicle.

Automatic and Hand-controlled Lubrication.

THE question of lubrication of motor cycle engines is always a most interesting subject, and we do not know of any detail in connection with these engines, except perhaps carburation, on which more diverse views are held. Many contend that the ordinary hand pump is sufficient, others prefer semi-automatic oiling by drip feed and spring forced pump, some pin their faith to lubrication by crank case suction, while a few are only content with forced feed oiling by gear-driven pump and a perfect circulation of the lubricant through all the bearings.

The defects of the hand pump are that all depends on the knowledge of the rider; the spring forced pump feed is a step in the right direction, but it only feeds at a fixed rate and does not vary with the engine speed; true, the feed can be altered by the rider to suit different conditions, but here again skill or knowledge has to be employed to regulate the supply. The crank case suction type is more automatic, and the faster the engine runs the quicker the feed becomes, but again it cannot be depended on entirely, and a hand pump is nearly always added to give an extra dose of oil for emergencies. Now, unless a motor cyclist is thoroughly accustomed to his engine, he cannot be sure that he is lubricating correctly for all conditions, and the result is that he adopts a course which means that the engine is more often than not over-oiled, and the outside of the crank case becomes very dirty and carbon deposits collect too rapidly.

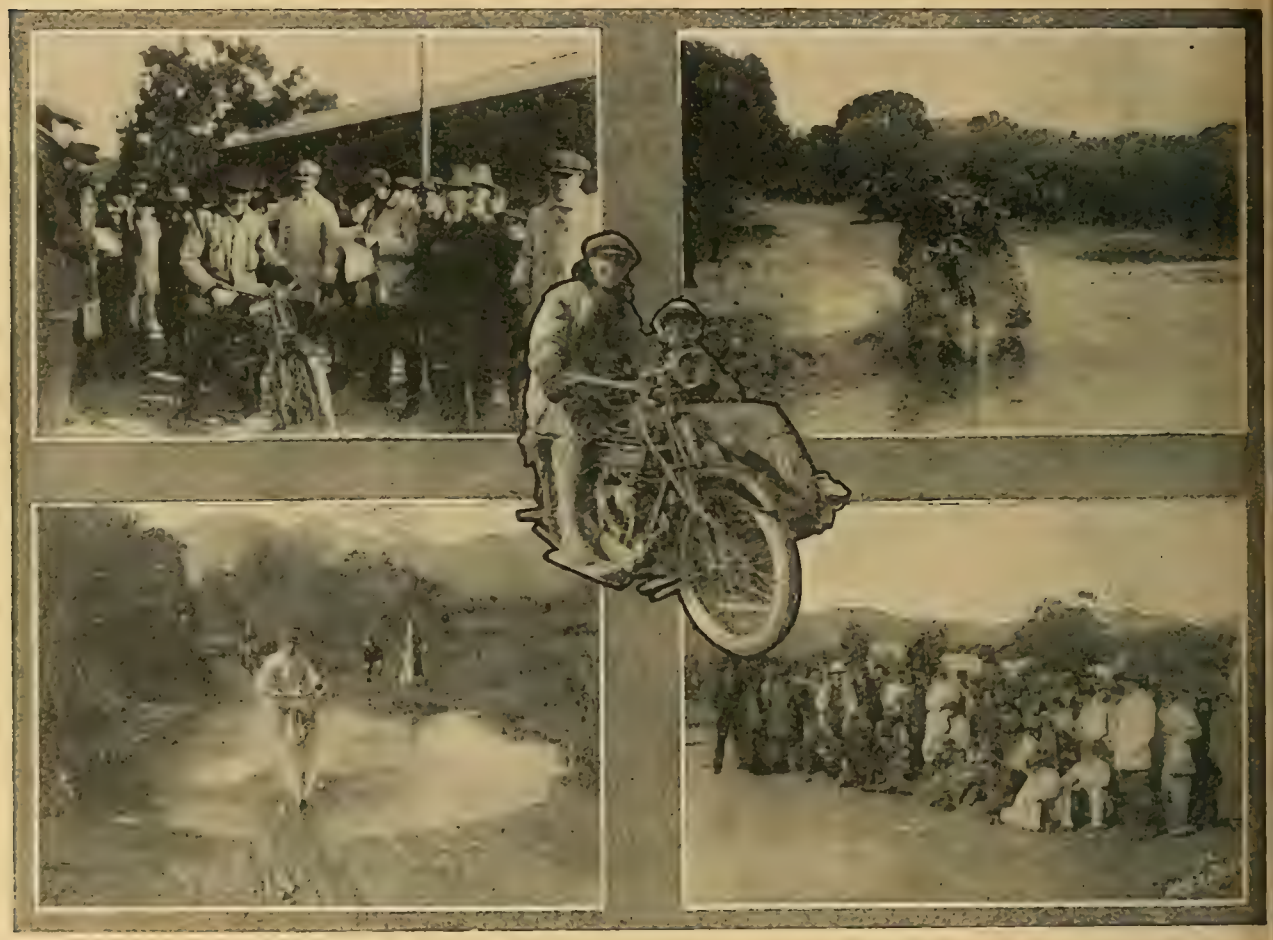
We do not advocate that a mechanical feed by pump should be adopted in every case as a cure for the above-mentioned disadvantage, but when one knows that in certain instances car engines have nothing more complicated in the way of lubrication than a small force pump, a sump from which the oil is drawn and whence it is returned by gravity, and that this system is employed on some of the best motor cars in this country, it makes one sorry that motor cycles are not more universally fitted with similar devices.

In addition, it is possible to drive a 12 h.p. four-cylinder car fitted with the above-mentioned system a distance of fifteen hundred miles with a consumption of one gallon of lubricating oil. Judging by the foregoing, some readers might imagine that no motor cycle possesses a mechanical system of lubrication; on the contrary, there are several employing some form of mechanical oiler, but they are in the minority.

A South African Reliability Trial.

GREAT interest was displayed in the second annual 100 miles reliability trial for the Continental Cup, which was held by the Cape Peninsula M.C.C. on June 3rd. Over forty competitors took part, including last year's winner, the Rev. J. B. Priston, who rode a P. and M. A speed of 20 m.p.h. for solo and sidecar machines had to be observed. The course was an exceedingly steep and rough one, and numerous mishaps occurred to several of the machines, such as wheels collapsing owing to the strain on the spokes, and sidecar frames breaking, while one or two sidecars overturned on the rutty roads. Only one minute was allowed in each control, riders being timed out directly this period of grace elapsed, so all adjustments had to be made during running time. It is interesting to note that pedalling gear is still fitted largely to Colonial machines, and highly useful it proved on several occasions on this trial, as extra power was often needed to get out of river beds and sand heaps.

The final results were as follows: Winner of the Continental Cup, H. Dreyer (6 h.p. Enfield sidecar), total error 30 seconds. Second place was taken by T. Widdowson (6 h.p. Clyde sidecar), while the Rev. J. B. Priston (3½ h.p. P. and M.) and W. Thompson (5 h.p. Clyde sidecar) tied for third place.



ANNUAL 100 MILES RELIABILITY TRIAL AT THE CAPE FOR THE CONTINENTAL CUP.

(1) The start at Sull River. Rev. J. B. Priston (3½ h.p. P. and M.), previous holder of the cup leaving.
(2) An Enfield sidecar being driven through the watersplash near Sir Lowry Pass.
(3) J. Davies (3½ h.p. Clyde) followed by de Krieken (3½ h.p. Emblem), crossing the river on the Gordon Bay road.
(4) A group of competitors and officials in the trial.
(5) The winner, H. Dreyer (6 h.p. Enfield sidecar), after being notified of his victory.

Spare Tube Carrying.

Spare tubes may be carried in many ways—round your neck, round your waist, in a kind of collarbox strapped to the carrier, or looped round the handle-bar. The "get-there" type of rider must carry a tube somehow somewhere, and the two latest accessories for storing tubes in strike me as improvements on their predecessors. One is a cheese-shaped case, made in two halves with hinge and lock, designed for fitting over a tube furled round the handle-bar, which certainly needs protection. The other is probably new to most of our readers, though I have been using it for a year or more. It is a sausage-shaped bag of soft leather, so spacious that the tube, when folded into four, can be readily slipped into place—a distinct contrast with the packing ingenuity required to house a tube in the average collarbox type of holder. When the tube is in the bag, the valve protrudes through a hole in the flap-closer; the bag is then loosely strapped to the saddle-pillar tube, and a couple of strokes of the inflator lock it securely in position. This tube case is known as the Robinson. A similar case should have a sale amongst car owners.

The 2⅜in. Tyre.

Loudly as we abused manufacturers when they were fitting small, flimsy tyres, I believe nobody has yet had the courtesy to express any public gratitude to the manufacturers for giving us 2⅜in. tyres of better quality, as so many of them have done this season, usually at a considerably increased cost to themselves, and without any increase of their catalogue prices. It is never safe to generalise on the tyre question, for one's luck varies so much from year to year. But I can make a boast which has not yet been possible for twelve long years. I have got into September without buying a new cover for the machine I work hardest, and without even removing one of the clinches from the rim. My 2⅜in. tyres have never sustained a single puncture in six months' hard work: the studs on the rear tread are not yet wholly non-existent, and if memory serves me aright, the tube has only had about two doses of extra air in this period. It is probably absurd to credit the fractional increase in tyre dimensions with the whole of this meritorious advance. I fancy the general quality of these tyres represents a very real advance upon the standard tyres of seasons, and the experience of my friends confirms my own impressions. Furthermore, I know of many sidecar and cycle car owners who have enjoyed quite unusually pleasant service from their 1913 tyres, so it would seem that motor cycle manufacturers are growing more generous, and tyre makers more conscientious. Competition is a wonderful thing.

Many 3½ h.p. Twins for 1914.

One of the features of the autumn show will be the number of twin-cylinder engines emanating from factories which have won their renown and earned their dividends with the 500 c.c. single. When I first "went dotty" on the two-step drive, as a kindly correspondent puts it, I scarcely foresaw how far the transmission question would take us. Some of the more recent perfectly balanced twins have bred a distaste for the slugging single-cylinder amongst fastidious riders, but I am quite sure that transmission factors accelerated, if they have not originated, the boom in small twins for which the autumn of 1913 will be remembered. The counter-shaft drive has proved its worth; but it has also proved to be too harsh for perfect riding when a high efficiency single-cylinder supplied the motive power. A couple of seasons may see the 500 c.c. twin installed as the touring mount *par excellence*. Three years ago I rode such a machine for a couple of months, and I implored its designer to persevere with it, for it was certainly a much sweeter and more docile mount than the super-compression single which was my daily fare at that period. He found riders in general did not want it, and so he surrendered his principles and imitated the fashion, instead of being courageously original.

Distinguished Debutantes.

Once again we enthusiasts who hoped that the future would bring us the perfect £100 four-wheeler on genuine cycle car lines are being given furiously to think. Scarcely a week passes but the motoring journals announce one or two *débutantes* in the miniature car class. The other week, for instance, brought the Wolseley and De Dion companies into this category. The Stellite car, designed by the Wolseley Co., is a miniature automobile, with a four-cylinder engine measuring 62 × 89 mm. with but two speeds, and the De Dion carette has a similar engine, with dimensions of 56 × 120 mm. and three forward speeds. Moreover, these cautious and deliberate propositions—put forth partly as an answer to the demand for cycle cars and partly as a retort to the Yankee invaders—are not cheap. The tiny De Dion, for instance, is listed at £221, for chassis with tyres but *sans* coachwork. When we contrast these specifications and figures, and the standing of the firms in question, with the ideal and the practical conception of what a cycle car should be, we may draw an obvious moral. In the opinion of some of the best automobile engineers, it is all but impossible to build up a successful business with a genuine £100 cycle car at the present juncture, supposing that customers expect such a standard of quality, comfort, and service as they are accustomed to find in a first class car or motor cycle.

A Stopping Problem.

I suddenly found myself up against the problem of my life the other day. I was descending a steepish and crowded street a shade faster than was wise, when my valve lifter wire broke. My throttle was adjusted so as just not to close, with the idea of keeping the engine ticking over with the clutch out. I had to stop in a hurry, I had to steer as trickily as a stage acrobat in a cycling show, and I could neither release the compression nor arrest the flow of combustible gas into the engine.

There was no time to think, but luckily my brain instinctively applied the knowledge latent in its subconscious pigeon holes. I threw the air lever wide open, and slung the ignition right back, simultaneously jamming on both brakes hard. The machine fetched up with an awful explosion in the silencer and a tremendous jerk, greatly to the alarm of the crowd, and to the amusement of the occupants of a passing sidecar, who, of course, were ignorant of my quandary.

The Improvement in Belts.

The season has now run more than three parts of its course, and I who owe a remunerative position in journalism to the frequent troubles I encounter, and the spicy copy that their telling makes, have not had a single belt stoppage! Apart from trade machines on loan, I have chiefly ridden a 750 c.c. single with a 1in. belt, and a 3½ h.p. single with a ⅞in. belt. The Forward fastener, of course, never breaks, but it is odd that neither of them has pulled out through a belt end in a combined mileage of 6,000 or so. The belts themselves have, of course, been flattered by the dry weather, but neither of them has so much as smelt a knife. The belt on the 750 c.c. machine is worthy of special honour, for it has no adjustable pulley to come to its aid: that on the 500 c.c. machine possesses an adjustable pulley, and naturally when I alter my gear ratios I set the pulley to give the belt its ideal tension. But even thus, I always try my belt after a long trip, and it has never been so loose that tightening seemed at all desirable: while the pulley has never been touched in the special interests of the belt, but only from a frank and sincere desire for a special gear ratio. Has the reduction in cost of rubber had anything to do with this new record of mine?

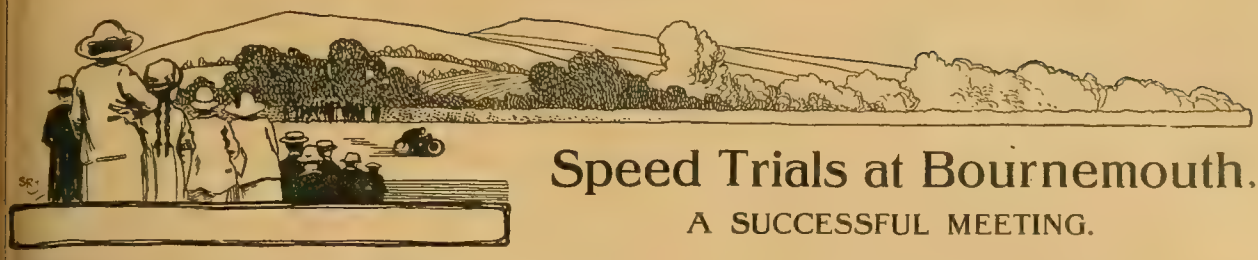
The North Derbyshire M.C.C. recently held a motor cycle Gymkhana at Chesterfield, at which the above two sidecars proved prize-winners in the decorated cars event. On the right is a 7 h.p. Indian which gained first prize while the second place was secured by the 6 h.p. Enfield on the left of the photograph.

Tank Filler Caps.

One or two accessory makers forwarded samples of patent tank filler caps, in reply to my strictures upon the many unsatisfactory patterns in use. Nobody ever questioned the fact that excellent stoppers are to be had; the point is that cheese-paring manufacturers apparently pass over the best examples, and go out of their way to buy inferior types, which are also made for them by accessory specialists in many cases. This mild insanity has one or two explanations. Either the makers in question do not know how bad the stoppers are, in which case they should inspect the store room issue book. Or they are aware that the stoppers are inferior, but grudge the fractionally greater outlay required for the purchase of the better article. The old round screw stopper was a very great deal more satisfactory than many new patterns at present in vogue.

"Acute Recurrent Bigenditis."

Such is the euphonious *nom de plume* adopted by one of my correspondents, who sends me a design for forced lubrication, which I think I have met on paper before. Briefly, his idea is that the bottom of the crank case should be dropped to form an oil sump, in which should be fitted an enormous oil pump of the ordinary type, operated by Bowden wire from the handle-bars, and provided with a very powerful coiled spring above its piston. The delivery pipe from this pump is to lead to the crankshaft bearings, and be of small bore: similar ducts are to be run from the crankshaft bearing to the crank pin bearing, and thence to the little end or gudgeon pin bush, by means of a thin pipe running up the connecting rod. The idea is that the rider fills the large pump in the sump by means of his Bowden wire and h.b. lever: the spring behind the pump piston will concentrate heavy pressure on the small oilways, and so we shall get a simple forced lubrication system, with no miniature working parts to cause trouble. Gravity would, of course, return the oil to the sump, and presumably some method of informing the driver that the pump was empty would be incorporated. I mention the idea to prevent others falling into the obvious pitfalls it contains. The pump would be required to maintain a fairly heavy pressure in order to keep a film of oil between the shafts and the bearings—were we not told the other day that some motor cycle big-ends bore a stress of 3,000 lbs. per sq. in. at the height of the explosive pressure? If the pressure on the pump were set at, say, 10 lbs., it would empty very fast, no matter how great its capacity, and how narrow the bore of the ducts. As a consequence the rider would be constantly refilling the pump, and the system would make greater demands on his intelligence and memory than the present admittedly makeshift method of a tank and a hand pump. In other words, this idea shows the need for all forced oiling systems to be mechanically operated, and indicates that many practical riders would welcome the adoption of some such methods as were introduced in the W. and D. engine. By the way, I rather object to my friend's psuedo-medical pseudonym. It is true that big ends do not last as long as they might, and that I myself seldom run an engine more than 5,000 miles before selling it. But although I generally run a machine about 5,000 miles, I scarcely ever rebush a big end.



Speed Trials at Bournemouth.

A SUCCESSFUL MEETING.

FROM the preceding weather one hardly dared expect a fine day for the Bournemouth club's speed trials, but no rain fell, though the morning broke dull and cloudy. In company with Mr. E. L. Herring, the club secretary, we made an early start for the scene of operations, and found preparations in full swing. The course lay in Canford Park, close to Wimborne, and had been kindly lent to the club for the day by Lady Wimborne. The actual surface of the threequarter mile track was excellent, though the gravelly nature of the soil combined with a slight head wind and a gentle rise prevented phenomenal speeds. The road was a wide one, and the two curves so gradual that it was decided to run the event on the knock-out principle, no times being taken. The organisation throughout was excellent, and Mr. Philip Grout, representing the A.C.U., is a great hustler, consequently the heats were quickly disposed of, and the last final was run off by 5.30. With the exception of the motor cycles belonging to two club officials no vehicles whatever were allowed on or near the course, a field being provided in which spectators could park their cars and motor cycles.

About twelve o'clock the sad news was brought in that S. L. Bailey, who has only just returned from Australia, had had a bad smash in King's Park while riding a competitor's machine. Unfortunately, he had broken his leg and smashed his wrist. This news cast a gloom over the proceedings at the start, but all were glad to hear that he was safely in hospital and progressing as favourably as possible.

A Punctual Start.

Punctually at 12.30 balloting took place for pairing and positions in Class I. Each competitor was handed a box from which he drew a number, each number being duplicated and marked either right or left, thus the men were automatically paired and took the side of the course allotted to them. At one o'clock the first pair, L. W. Adams and H. Springfield, both mounted on Douglases, were sent away. Adams led from the start, and won comfortably. The next heat was won by G. H. Fry (2¾ Douglas), Cocker's little 2½ Singer being considerably slower in getting away, though once under way it showed a good turn of speed. Kickham's Douglas has new "internals," which were hardly run in, but he managed to beat Colver (2¾ Enfield) by a smart get away. In the semi-final Adams beat Fry, Kickham having a bye, and in the final Adams proved the winner, making a fine performance for an amateur. In one heat his machine caught fire just before the start, but the flames were extinguished before any damage was done. Results :

CLASS I.—Motor Bicycles up to 350 c.c.

First Heat.—L. Adams (2¾ Douglas) beat H. Springfield (2¾ Douglas), G. H. Fry (2¾ Douglas) beat J. Cocker (2½ Singer), and E. Kickham (2¾ Douglas) beat H. Colver (2¾ Enfield).

Second Heat.—L. Adams beat G. H. Fry; E. Kickham a bye.

Final.—L. Adams beat E. Kickham.

The next event to be run off was Class VI. for passenger machines, and, curiously enough, all the heats were easily won, though the final was a good race, both McMinnies and Griffith travelling at high speeds. The former made fine starts on each occasion. In his heat against W. D. South, Douglas Hawkes was unlucky enough to stop his engine, whereupon his opponent sportingly returned to the start and the race began afresh. Results :

CLASS VI.—Sidecars and Cycle Cars.

First Heat.—G. Griffiths (8 Zenith sc.) beat A. E. Gadsden (7 Indian sc.), H. Walker (8 Bat sc.) beat Cecil Hann (G.W.K.), W. D. South (Morgan-Precision) beat D. Hawkes (D.E.W.), and W. G. McMinnies (Morgan) beat G. W. Trendal (Morgan).

Second Heat.—G. Griffiths beat H. Walker and W. G. McMinnies beat W. D. South.

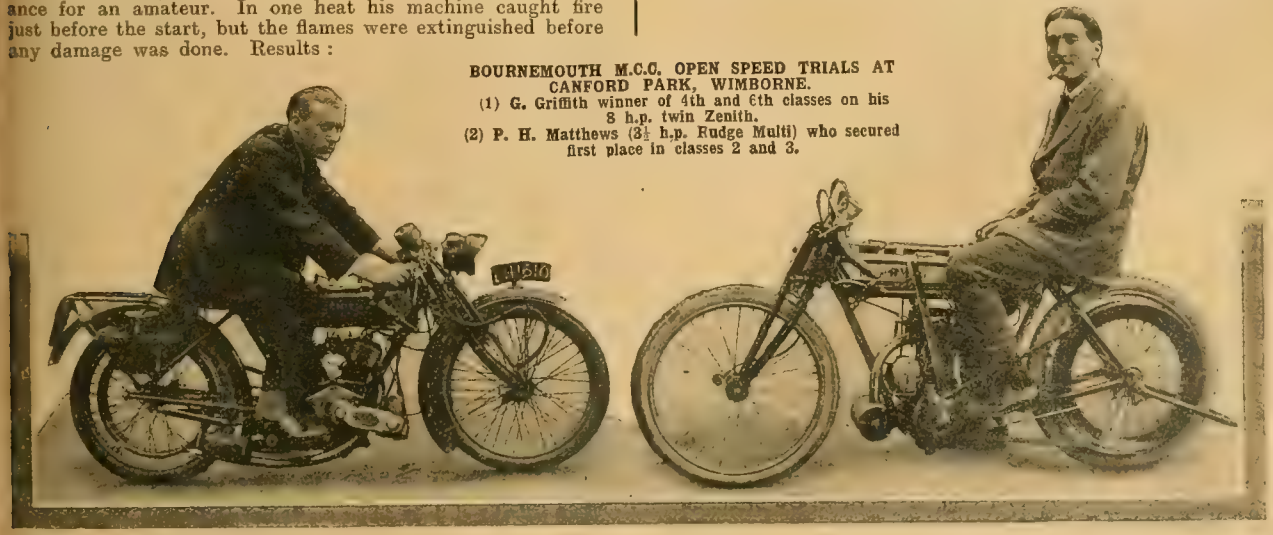
Final.—G. Griffith beat W. G. McMinnies.

Both McMinnies and South were driving Grand Prix Morgans.

There were only two runners in Class V. for sidecar combinations up to 650 c.c., and it seems odd that this class was not better supported. There were seven entries, but five failed to put in an appearance, C. T. Newsome's absence being accounted for by a spill during the previous week-end. Results :

Dixon Pollard (3½ Bradbury sc.) lost to A. E. Ede (3½ Rover sc.). The win was an easy one.

There was a good entry in Class IV., and the racing proved exciting, there being good finishes between Harvey Walker (8 Bat) and A. E. Gadsden (7 Indian); and P. Matthews (3½ Rudge) and H. Riddell (8 Matchless-Precision). Though Griffith beat Cocker (3½ Singer) easily, Cocker was travelling very fast and made a good fight, considering the



BOURNEMOUTH M.C.C. OPEN SPEED TRIALS AT CANFORD PARK, WIMBORNE.
(1) G. Griffith winner of 4th and 6th classes on his 8 h.p. twin Zenith.
(2) P. H. Matthews (3½ h.p. Rudge Multi) who secured first place in classes 2 and 3.

Speed Trials at Bournemouth.

difference in engine sizes. Crawley (3½ Triumph) rode magnificently and Carryer (3½ New Imperial) made a good show, especially considering the fact that he was new to his mount. The only unfortunate incident of the day occurred in this class, when there was a mistake in the pairing for the semi-finals, which caused a little friction and delay, though everything was finally smoothed over successfully. Results:

CLASS IV.

(Motor Bicycles up to 1,000 c.c.)

First Heat.—J. Cocker (3½ Singer) beat E. Kickham (2¾ Douglas), G. Griffith (8 Zenith) beat E. Baker (3½ Ariel), H. Walker (8 Bat) beat A. E. Gadsden (7 Indian), G. H. Fry (3½ Singer) beat T. W. Hart (6 Zenith), F. W. Carryer (3½ New Imperial) beat H. Gooden-Chisholm (3 Enfield), H. Riddell (8 Matchless) beat P. Matthews (3½ Rudge), S. Crawley (3½ Triumph) beat Mercer Simpson (3½ Rudge), and M. Burton (5 Matchless) beat O. B. Goodman (7 Indian).

Second Heat.—G. Griffith beat J. Cocker, H. Walker beat G. H. Fry, H. Riddell beat F. Carryer, and S. Crawley beat M. Burton.

Crawley and Walker stood down, leaving Griffith and Riddell in the final, the former winning with ease.

Class II. for machines over 350 and up to 600 c.c. was taken next, and provided the closest finish of the day, for in the second round E. Perkins and E. Baker, both on 3½ Triumph), E. Baker (3½ Ariel) beat H. Gooden-Chisholm (3 could tell who had won. Two other close races occurred, those between Crawley and Fry and Matthews and Cocker, both the last mentioned heats being run at very high speeds, while the final between Crawley and Matthews was won by the latter after a fine race. A curious incident happened in the first round when Goodman and Jones, both fellow club members, mounted on B.S.A. machines, drew together, the former winning after a fairly close race.

CLASS II.

(Over 350 c.c. and up to 600 c.c.)

First Heat.—E. Perkins (3½ Triumph) beat F. Beynon (3½ Triumph), E. Baker (3½ Ariel) beat H. Gooden-Chisholm (3 Enfield), P. Matthews (3½ Rudge) beat E. Buchanan (3½ New Imperial), J. Cocker (3½ Singer) beat D. Hawkes (3½ Ixion-Precision), F. Carryer (3½ New Imperial) beat M. Simpson (3½ Rudge), S. Crawley (3½ Triumph) beat G. H. Fry (3½ Rudge), O. B. Goodman (3½ B.S.A.) beat C. D. Jones (3½ B.S.A.), and F. Reynolds (3½ Triumph) beat F. Stocker (3½ Rudge).

Second Heat.—E. Perkins beat E. Baker, P. Matthews beat J. Cocker, S. Crawley beat F. Carryer, and F. Reynolds beat O. Goodman.

Third Heat.—P. Matthews beat E. Perkins and S. Crawley beat F. Reynolds.

Final.—P. Matthews beat S. Crawley.

Class III. was run off last of all, and was for those who had never won in a speed trial; machines from 350 to 600 c.c. In the second round, H. L. Jones, in the excitement of the race, drew across to the wrong side of the road, thus baulking Chisholm who was close behind him. The heat was re-run, but Chisholm lost by a few yards. Results:

CLASS III.

(Over 350 c.c. and up to 600 c.c. restricted).

First Heat.—O. Goodman (3½ B.S.A.) beat F. G. Stocker (3½ Rudge), F. Carryer (3½ New Imperial) beat C. D. Jones (3½ B.S.A.), D. Underwood (3½ Singer) beat F. Beynon (3½ Triumph), F. Reynolds (3½ Triumph) beat E. Baker (3½ Ariel), P. Matthews (3½ Rudge) beat G. H. Fry (3½ Rudge), E. Buchanan (3½ New Imperial) beat H. Mitchell (3½ B.S.A.), H. G. Chisholm (2¾ Enfield) beat B. Harman (3½ Bat), and H. Jones (3½ Triumph) beat —. Hiscock (3½ Triumph).

Second Heat.—F. Carryer beat O. Goodman, F. Reynolds beat D. Underwood, P. Matthews beat E. Buchanan, and H. Jones beat H. Gooden-Chisholm.

Third Heat.—F. Reynolds beat F. Carryer and P. Matthews beat H. Jones.

Final.—P. Matthews beat F. Reynolds.

Awards, will be as follows (subject to confirmation):

CLASS I.—First award, W. Adams (2¾ Douglas); second award, E. Kickham (2¾ Douglas).

CLASS II.—First award, P. Matthews (3½ Rudge); second awards, S. Crawley (3½ Triumph), E. Perkins (3½ Triumph), and F. Reynolds (3½ Triumph).

CLASS III.—First award, P. Matthews (3½ Rudge); second awards, F. Reynolds (3½ Triumph), F. W. Carryer (3½ New Imperial), and H. L. Jones (3½ Triumph).

CLASS IV.—First award, G. Griffith (8 Zenith); second awards, Riddell (8 Matchless), H. Walker (8 Bat), and S. Crawley (3½ Triumph).

CLASS V.—First award, A. E. Ede (3½ Rover sc.).

CLASS VI.—First award, G. Griffith (8 Zenith sc.); second award, W. G. McMinnies (Morgan Grand Prix).

Incidents of the Trials.

P. Matthews is a coming rider, if he has not already arrived, but what is it he mixes with his petrol?

Crawley (Triumph) was using a new carburetter with the jet between the slides, and Colver had an auxiliary oil pump fitted to his Enfield.

Riddell's Matchless-Precision was fitted with an Amac carburetter and a huge float chamber.

Carryer was riding the T.T. new Imperial, and Buchanan a small twin, which was going very well.

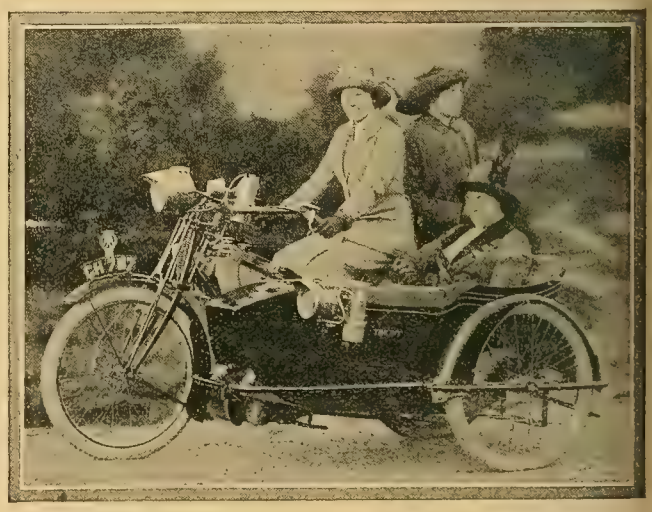
The G.W.K. driven by C. Hann had a racing body, but did not seem to be up to form.

F. Reynolds, with his Triumph, made some fine performances.

The officials of the Bournemouth club are to be congratulated on the results of their hard work and good organisation.

An Enthusiastic Lady Motor Cyclist.

Our illustration shows Miss Walmsley, of Derby, an enthusiastic motor cyclist. She rides an Ivy-Precision ladies' model. In place of the standard 3½ h.p. engine a 4¼ h.p. has been fitted, which has a remarkable turn of speed, and the Derbyshire hills are overcome with surprising ease even though the driver has a passenger also on the carrier. For this purpose a neat spring cushion has been fitted on to the carrier which makes quite a comfortable seat. Miss Walmsley recently undertook a 700 mile tour with a lady passenger and had no occasion even to open the toolbag, but, if necessary, this lady rider is quite capable of doing her own running repairs.



Miss Walmsley of Derby driving her 4¼ h.p. Ivy-Precision and sidecar, on which she recently undertook a 700 mile tour.

A Run on a New 5-6 h.p. 654 c.c. Twin Hazlewood.

ON the occasion of a recent visit to the Hazlewood Works, Coventry, Mr. William Hazlewood offered us a trial run on one of the new twin Hazlewoods, similar to the two machines which both recently obtained gold medals in the A.C.U. Six Days Trials. We fixed up an appointment, and Mr. William Hazlewood met us with a smart combination, the passenger being accommodated in a Canoelet sidecar painted to match the machine.

The engine is a new model twin J.A.P., having a bore and stroke of 70 × 85 mm., giving a cubic capacity of 654 c.c., and is fitted with side by side valves. An innovation for Hazlewood machines has been made in this model, for a ball bearing counter-shaft is driven from the engine by chain, while a 1in. belt running over a large diameter pulley on the counter-shaft transmits the power to the new Mark VII. Armstrong gear in the rear wheel.

Locking device for hub gear on the three-speed Hazlewood.

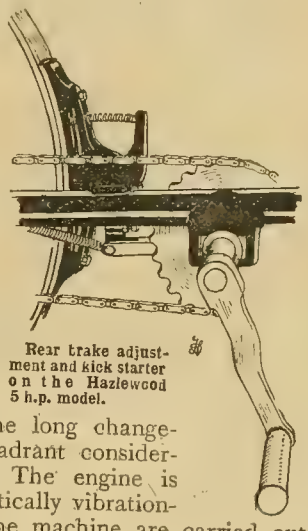
Having had a look round the machine, we took our seat in the sidecar and the combination glided smoothly away. Top gear (4½ to 1) was engaged as soon as the worst of the traffic was passed, and we sailed off to Warwick *en route* for Edge Hill.

Warwick en Fête.

The run to Warwick was uneventful, but on entering the town we encountered quantities of sheep and cattle, while the inhabitants were preparing for the cattle show. After Warwick we changed places with the driver, and soon discovered that the machine was easy to handle, the controls all being set in convenient positions. We were soon bowling along between Barford and Wellesbourne. Friz Hill gives a good idea of how a machine will perform on Edge Hill, as it is a deceptive rise and quite steep towards the top. However, the Hazlewood proved that it had ample climbing powers, though a sign of clutch slip was noticeable. This, we discovered, was caused by over-lubrication, and it was a matter of a moment to run out the superfluous oil, and thus put matters straight. The roads were in fine condition, but sidecar passengers should beware of the culvert about two miles from Kineton, for if taken fast a nasty bump will be felt. Soon the round tower came into view, and we began the long ascent to the summit of the Edge Hills, which is too well known to need description.

The Ascent of Edge Hill.

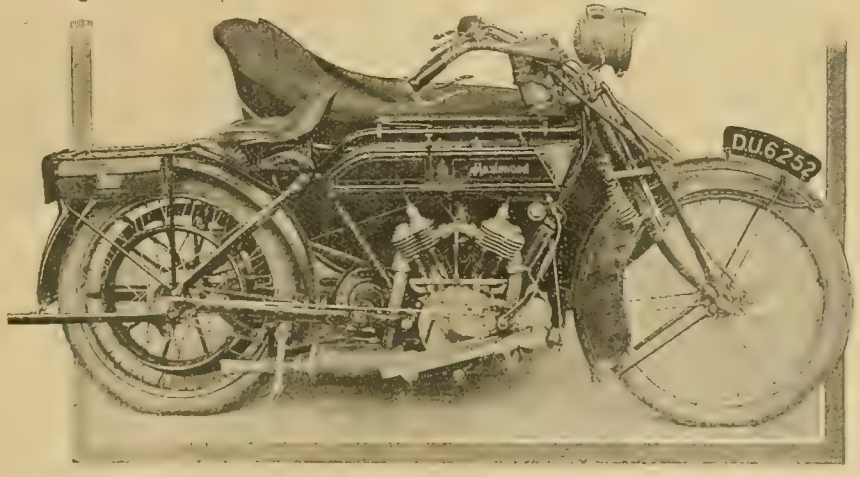
Changing into middle gear early, we were more than halfway up the hill before the low gear was required, and then there was so much reserve power that we only required about quarter throttle for the remainder of the hill. When one considers that the driver and passenger weighed together approximately 27 stone, and that engine capacity is only 654 c.c., the performance is distinctly good, and the silence and smooth running of the engine are remarkable. As we had not much time at our disposal, we returned by the same route, the descent being a fine test for the brakes, which proved excellent. The front brake is considerably above the average, and the rear brake, which consists of a large Ferodo-lined shoe acting externally on a steel drum, is very powerful.



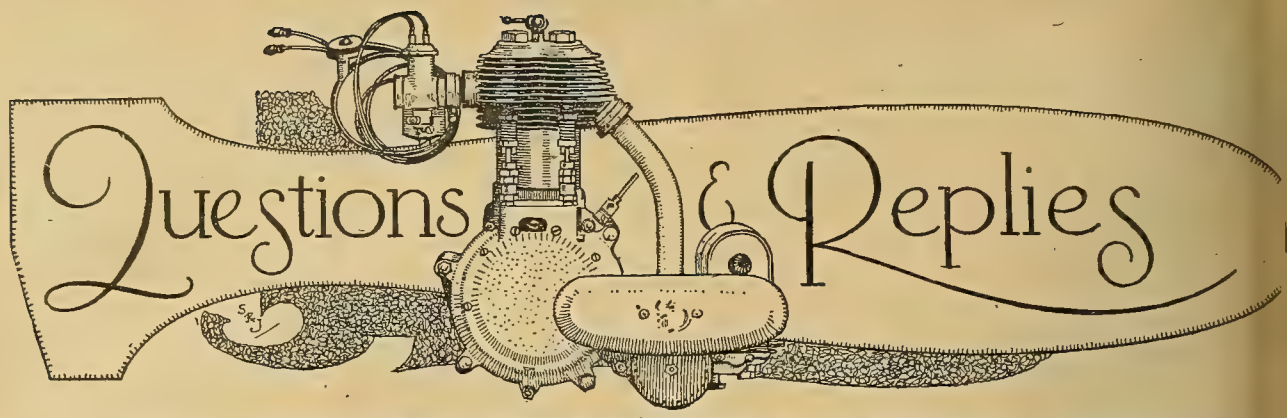
Rear brake adjustment and kick starter on the Hazlewood 5 h.p. model.

The Mark VII gear is a more robust edition of the Mark VI., and the long change-speed lever and large quadrant considerably simplify changing. The engine is pleasant to drive and practically vibrationless, and the details of the machine are carried out in a very thorough manner, all bolts being either split pinned or lock nutted. A Cowey speed indicator was fitted, and we found that to average the legal limit was a matter of ease even with the full load.

We returned to Coventry without any untoward incidents and later went out again for an evening run, when the machine ran equally well, so that it was with some regret that we returned the outfit to the works on the following morning. Those who require a moderate powered sidecar machine and are particular about silence would do well to examine the 5-6 Hazlewood, on which they will find many points of considerable interest.



The 5 h.p. Hazlewood twin cylinder sidecar model with three speed Armstrong hub gear and combined chain and belt transmission. The sidecar is a Canoelet



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

The Midlands to the South Coast.

Will you kindly furnish me with particulars respecting the best route from Market Harborough to Eastbourne, avoiding London? My machine is a 3½ h.p. J.A.P., single gear, with sidecar. —J.G.G.

Your best route is Market Harborough, Northampton, Newport Pagnell, Woburn, Dunstable, Tring, Amersham, Beaconsfield, Slough, Windsor, Staines, Chertsey, Guildford, Dorking, Reigate, Crawley, East Grinstead, Uckfield, Hailsham, and Eastbourne. This is not quite the shortest route, but it is a good one, as it avoids London.

A Question of Licences.

My son has just received a summons for using a motor cycle without having paid the annual tax. The machine belongs to me, and when I took out the £1 licence I had only acquired the machine twenty days previously. (1.) I understand that twenty-one days are allowed from first riding the machine to getting the licence; is this so? If so, what Act does this come under? (2.) Is it a fact that if no notice of intending prosecution is given within twenty-one days of the alleged committal of the offence no case can be brought against one? (3.) I have not ridden the machine at all, but my son took it without my knowledge. Ought I, and not my son, to have been summoned? It was over ten weeks from the alleged offence being committed to receiving the summons, as my son was not stopped by the police, and this is absolutely the first we have heard of the matter.—P.A.

(1.) It is quite right that twenty-one days are allowed from the time you begin to use the machine. See the Customs and Inland Revenue Act of 1869, Section 32. (2.) You are wrong here. This twenty-one days' grace only holds good when you are prosecuted for having exceeded the speed limit. (3.) Certainly you, and not your son, ought to have been summoned. The summonses are issued by the County Councils and not by the police for offences of this kind.

How to Find Cubic Capacity.

Please answer the following questions: (1.) The meaning of the term "c.c." as in 500 c.c., and how it is arrived at by the bore and stroke. (2.) Tim Wood's average miles per hour on his two-stroke Scott in this year's T.T.—R.J.V.

(1.) The meaning of c.c. is cubic centimetres. This is found from the formula .7854 D^2S, which, put more plainly, means that the diameter in centimetres is multiplied by itself, then by the stroke (also in centimetres) and by .7854. For example, an 85×88 mm. engine works out as follows: $8.5^2 \times 8.8 \times .7854 = 499$ c.c. (2.) T. Wood's average speed in the T.T. Race was 48.28 miles per hour.

Motor cycling in the Tyrol. A rider of a 3½ h.p. Triumph photographed on the Stelvio Pass, 9,184 feet above sea level. The boundary between Italy and Austria is marked by the frontier stone shown.

Starting Difficulty with old Engine.

I have a 3 h.p. N.S.U., fi with low tension magneto coil. I do not know the of engine, but it has mechar valves with the exhaust directly u the inlet and slightly cambered pi top. I have a lot of trouble to st even after an injection of petrol its cylinder, but once upon the it is all right, except at slow spe when it will knock badly. I been altering timing gear of v and have made a mess of it, should be glad to know what is correct position of pinions and for timing? What is about dat engine?—W.G.

If there is no air leak at the inlet unions and the carburetter is adjusted to give too much air at speeds, starting should be quite If, however, you cannot trace the d in the carburetter, it might be pos that the magnets require to be magnetised. Possibly the timing pi are marked. If not, set the exh valve to close with the piston dea the top of the exhaust stroke, and inlet valve to open when the pisto $\frac{3}{16}$ths down the suction stroke. The of the machine will be about 1905. N.S.U. Co. can tell you if you send t the engine number.

Level Crossings and Motor Cyclists.

I should be greatly obl by your legal opinion on following. The other evenir was out for a run near bridge, when I had to over a level crossing, and on cor up to the gates, which were close blew my horn, but no one cam open them. So I shouted, and a the man in charge to come and the gates, to which he replied, " you can go through the cycle gat which eventually I had to do, and my machine is a fixed engine and gates were small, it was no easy m to get it through. Can I force man in charge to open the gates a motor cycle, or was he right making me go through the cycle ga —W.L.G.

We have submitted your letter to legal adviser, who replies as follo

It is difficult to answer this query. here may be some special stipulation ith regard to the gate referred to and the user of the level crossing in the ecial Act of Parliament under which e railway was constructed. Subject to is, the Railway Act of 1845 provides at when a railway crosses a public ad on a level, the company shall main-in gates across such road, and shall nploy proper persons to open and shut hem, and such gate shall be kept closed xcept when carriages, etc., wish to oss the railway. It is certainly the uty of the man in charge of the gates open them unless a train is approach-g, and I have no doubt that it would possible to maintain an action against he railway company if a member of the ublic were wrongfully obstructed in assing, especially as your correspondent as no right to open the gates himself. robably the simplest way is to threaten report the matter to the station aster, or, if necessary, to the head fice."

Hampstead, N.W., to Southend-on-Sea.

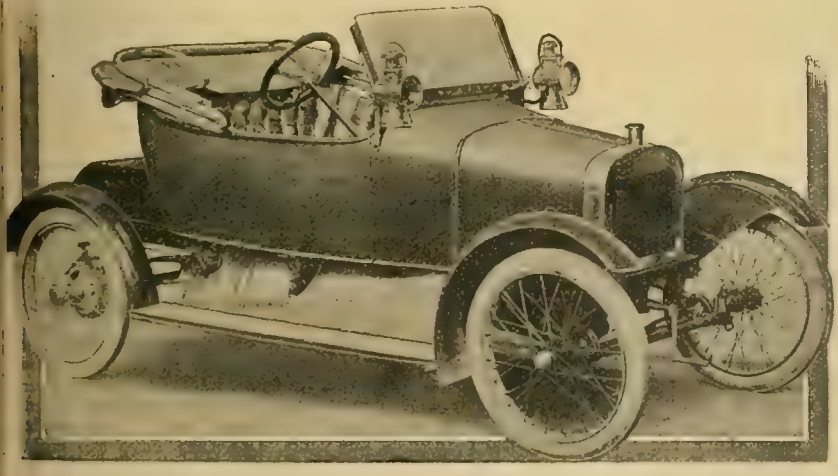
I should be obliged if you could inform me which is the best road from Hampstead, N.W., to Southend-on-Sea, avoiding tram-lines and traffic as much as possible. Any information as regards bad and dangerous roads would be appreciated. I do not mind going a mile or two extra to keep to good roads. Also as much detail as possible regarding the route out of London would be acceptable.—H.D.

ou had better purchase a copy of the A.C. official map of Recommended outes round London (obtainable from ese offices, price 1s. 7d. post free), and ke the following route: Hampstead, shops Wood, East Finchley, down swell Hill, through Hornsey, turn ght where there are central standards about twenty yards, and then left, aving the tramlines altogether and ing absolutely straight on; cross the ondon-Ware Road, past the "White art," Tottenham Hale, straight on, llowing the tramlines past Black Horse ad Station into Woodford Road; here rn right down Snake's Lane, continuing raight on as far as Chigwell Row, here turn right and go through Collier Row to Romford; then go through Upminster, Orsett, Horndon-on-the-Hill, Stanford-le-Hope, Hadleigh, to Southend. This is a most complicated and tricky route and all tramlines cannot well be avoided.

Touring in Scotland.

I want to motor cycle to Edinburgh from Newark, and would be much obliged if you could send the route taken by the competitors in the London-Edinburgh run. I believe they turned west at Scotch Corner, but I do not know the route from there. I will return *via* the old route, which, I understand, is through York and Newcastle, but would be obliged if you could give me some further particulars of the towns passed through. I note that "Ixion" gives a description of a tour in Scotland, but I want to avoid the ferries that he mentions. His route is as follows: Edinburgh, Granton, Perth, Pitlochry, Blair Athol, Kingussie, Carrbridge, Inverness, Fort Augustus, Spean Bridge, Fort William, Ballachulish, Shian Ferry, Chan, Inverary, Arrochar, Stirling, Edinburgh. This means ferrying at Ballachulish, Shian, and Connel. Also taking steamer across Loch Lomond and Loch Katrine, but I should like to avoid ferrying, if possible; could I do so by a slightly different route: Any information you can let me have will be most welcome. —G.K.C.

When going from Newark to Edinburgh, go straight up the Great North Road through Ferrybridge and Aberford to Wetherby, then go through Boroughbridge and along Leeming Lane to Scotch Corner, then on through Bowes, Brough, Appleby, Penrith, Carlisle, Longtown, Langholm, Teviothead, Hawick, Galashiels, Edinburgh. If you follow the route suggested in your letter we do not see how you can possibly avoid ferries, though, of course, you need not take the steamer across Loch Lomond and Loch Katrine, if you are prepared to miss seeing the Trossachs altogether. It would, however, be a pity to do this as the scenery is very fine. On the return journey there is no necessity to go through York.



The latest pattern Ranger cycle car with 8 h.p. twin water-cooled engine.

READERS' REPLIES.

Engine Stops when Hot.

I recently met with rather a puzzling experience which may perhaps interest your readers. Riding a 1912 Douglas, I was for some time sorely perplexed by a sudden "petering out" which invariably occurred after opening the throttle for a hill. The engine would suddenly lose all power, but continue to fire weakly on half throttle, and if opened out more the carburetter would start spitting in a violent and most impolite manner. I naturally suspected valve trouble, and changed and well cleaned the valves, but with no better results. The trouble continued till I bethought me of a cheap plug I was using in the rear cylinder, the said plug having rather thin electrodes. I changed it for a more substantial one, and the trouble stopped at once. It was evidently caused by the thin electrodes getting red hot when the engine was under heavy load and igniting the incoming charge. This may explain your correspondent "J.C.'s" trouble (page 1142 in the issue of August 28th).—Lt. 2563.

In reading your Questions and Replies I noticed a letter complaining of overheating and sudden stoppage from "J.C." Might I supplement your reply, as a short time ago I suffered from his complaint exactly? After making numerous experiments with no good effects, I eventually traced my trouble. The sparking plug I was using shall be nameless, but it had a very thin point, which projected into the cylinder, and after a few miles got hot and caused pre-ignition and a quick pull-up. I changed it for a Bosch four-point, with points inside the body of the plug and not projecting, and lo! my trouble vanished into thin air, and every time I replaced my old plug, which was a good one (by name) and cost 3s. 6d., the same trouble reappeared. I trust my experience may be of interest to the readers (especially "J.C.") of *The Motor Cycle*, to which paper I feel I owe a good deal. I have learnt a lot by going through the queries under Questions and Replies, and endeavouring to solve them by myself and then reading your reply. Has any other reader tried this? I am using benzole, costing 1s. 2d., at the present with a B. and B. carburetter, and am getting 120 miles to the gallon with a 25 jet. My machine is a 3½ h.p. and weighs 210 pounds. I may say that fitting so small a jet has rendered my carburetter an automatic one at anything up to twenty miles an hour—a little relief after being used to "twiddling" two levers, so I shall not trouble to fit a smaller choke tube, which, by the way, I think might solve "J.K.'s" trouble. —A. ELLIOTT.

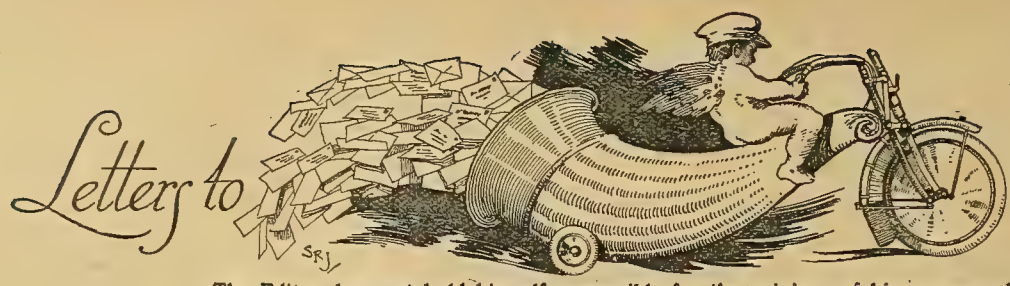
EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"W.M.C." (Higham Ferrers).—Wall Auto-wheel. Power, safety, reliability, and effect on bicycle.

"F.T." (London).—Most suitable rubber belt for Brampton gear. Wear, etc.

"D.B." (Halifax).—6 h.p. A.J.S., three speeds. Engine and gear reliability.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Wet Tan.

Sir,—I should like to give your readers the benefit of the following experience: Riding along the Watling Street late on Sunday, 31st ult., I came across a stretch of the road covered with a layer of tan, presumably with the idea of deadening the noise of the traffic. Immediately I had a tremendous side-slip, and was sent flying off my machine, fortunately, however, without serious results.

While realising the necessity in cases of serious illness for treating the road in some such fashion, I think the authorities concerned should be persuaded to adopt some less treacherous material, such as straw. Tan is quite safe to ride over as long as it is dry, but when wetted by rain is certain to cause a bad side-slip.

As this is the second experience of this sort I have had I shall in the future treat wet tan with more respect. The trouble is that at night it is almost impossible to detect it till too late. I shall be interested to hear whether any of your readers have met with mishaps due to the same cause.

F. VINER.

Carburetter for Scotts.

Sir,—I have read with interest the letter in the issue of the 21st ult. from Mr. R. F. G. Kelly. I also am a Scott enthusiast, and, like him, have fitted the Binks carburetter to my machine. I, however, did not get the same satisfactory results as achieved by Mr. Kelly.

I certainly found that the Binks carburetter did effect an improvement, but my chief cause of complaint was that the combination of jets required for perfect running one day were by no means the same combination required another day. I also found that it did not give me more m.p.g. than the Scott carburetter.

Hearing very good accounts of the Lukin, I then decided to fit this, and can honestly say that it effected a great improvement in all respects. I can now average 50 m.p.g. with sidecar at an average running speed of 25 m.p.h.; solo about 70.

My machine, like Mr. Kelly's, will now start at the third kick down from cold, while the slow running is such that I have done away with the half compression valves, there being absolutely no need for these.

The great charm of the Lukin carburetter is the ability to tune it up for any one point without affecting any other point. For instance, adjusting the carburetter for slow running has no effect whatever on full throttle position, whilst the acceleration is simply marvellous.

I certainly think that this carburetter should be more widely known, as, although it is only a single lever one, it seems to me to perform anything that a two lever carburetter will do without any disadvantage whatever.

I also, like Mr. Kelly, have no financial interest in either C. Binks or Lukin, Ltd.

GEORGE BAX.

Carburetters and Flexibility.

Sir,—Mr. Binks's idea of an A.C.U. trial of carburetters is an excellent one, but I entirely dissent from him that a big mileage cannot be obtained except at the expense of flexibility. This may be correct in the case of a fixed, single jet instrument, but not in that of a good variable jet type for the reasons given in my previous letter and "N.R.C.'s."

Failing an A.C.U. test, I would be happy to compete in a friendly private match, using my universal model B. and B. (which, like the cycle, is absolutely "unfaked") against a single-lever two-jet Binks, the trial to be held under the surveillance of a member of the staff of *The Motor Cycle*, say "Ixion." I would accept Mr. Binks's conditions (1), (3), (5), (6), (9), and likewise (11), provided that this does not prevent altering the jet lever and air ports from the saddle whilst riding. As regards (7), a shorter stretch than five miles should suffice to test the speed, and (2) and (4) are impracticable with my own bicycle, being a fixed gear T.T. Both carburetters to be tested on the same machine.

No doubt "N.R.C." might like to join in with his Norton.

I have no financial interest in any individual type of carburetter, having used during the past three years the Amac, Triumph, Universal, B. and B., and Senspray. Hence, if the Binks proves superior no one would be better pleased than myself. If it does I will undertake to order one in November on my 1914 machine, but if the B. and B. wins I suggest that Mr. Binks should pay for such other type as may be ordered (at a price not exceeding that of his own make).

AUTOBORE.

[As already pointed out we think the idea of an A.C.U. carburetter test is excellent.—ED.]

Military Motor Cyclists.

Sir,—It appears to me that some of the critics of the War Office scheme are tackling this question from the wrong point of view, as they continually labour the point that there is no money to be made while in camp with the machine. Surely no motor cyclist who is patriotic enough to join the force wants to see his way to clearing a profit on the thing before going further with it.

Another idea that seems to me totally wrong is that one must go all out the whole time when employed on this service. This is a most mistaken notion, and a rider conducting his campaign on these lines is almost certain to render himself useless to his officers before many days have passed. Of course, it was all very well to show what *could* be done while the War Office were hesitating, but a messenger who can average 30 m.p.h. on decent roads will be far ahead of anything now at the disposal of the authorities, and it takes a lot of miles to run up to 8s. per day at 30 m.p.h.

My idea is that the annual camp work is one of the very best types of holiday that a motor cyclist can wish for. He is kept free of charge during his fortnight (or so much thereof as his time permits of) in camp, and ranks as a non-commissioned officer among excellent fellows from the time of his acceptance. If he likes a bit of speed he can have it at less than it usually costs him, while if he is a steady rider he can still be of much service, and see a lot of most interesting work at the very minimum of holiday cost. Added to this is the fact that annual training camps are almost always in fine situations, and, from the nature of a camp, within easy reach of civilisation, and the wonder is that there has not been a rush to fill the few vacancies that remain.

Some doubt has arisen as to the availability of various machines, and I shall be delighted to help anyone in this district (Leeds) who may be hesitating on this or any other score.

It should not be forgotten also that there are two sections available—the Royal Engineers Special Reserve and the Territorial Motor Cyclists. The main difference is that in the former the age of enlistment is confined to between 18 and 30, while the latter is open, and the Special Reserve draw slightly higher pay and travelling expenses to camp. Either section may *with their own consent* be employed on military duty at any time, *i.e.*, they have the right of refusal should circumstances make it impossible for them to attend.

J. STUART WHITE.

Hub & Counter-shaft Gears.

Sir,—In regard to the letter by the Sturmey-Archer Gear Co. on "Hub and Counter-shaft Gears," I should like to give my opinion as I am a user of the counter-shaft type.

My mount is a 1913 Premier with two-speed counter-shaft gear. Their objections are: (1.) The gear runs at a high speed and considerable noise is created. I agree that the gear runs at a higher speed than the hub type, but only makes a slight hum when in low gear (the top gear driving solid); there is no noise whatever when changed to high. (2.) The front chain on my machine I never hear. It is silent and runs in an aluminium case, and has run 1,430 miles to the present, has only been adjusted once (not really necessary), and is as good as new. I know an Indian rider who only changed his front chain quite recently after two years' use with sidecar attached. (3.) The drive is a little fiercer only at slow speeds and is not noticeable otherwise. My back tyre wore out at 400 miles (due to a fault), and I have now fitted a heavy non-skid Kempshall, and have had no trouble since. It is almost as good as new. (4.) I have not noticed the vibration referred to. (5.) They say the only point in its favour is that the back wheel can be removed more quickly for tyre repairs, and this, they say, only applies to the novice. Then, does the expert love to take an hour to change a tyre when he can do it in ten minutes? Surely it is easier to slacken two nuts and drop the wheel out than take off the free engine and change-speed rods, all of which need replacing. The expert is like the rest of us, he likes to take out and replace his wheel as quickly as he possibly can. Then they outline the advantages of the hub gear. Let me outline the counter-shaft advantages.

(1.) The gear is more central, therefore weight is evenly distributed between the two wheels.

(2.) Should anything go wrong the gear box can be detached and more easily inspected than the hub type, one rider of which spent nearly six hours (see page 1057) trying to repair.

(3.) The belt is practically everlasting.

(4.) Ease of detaching the rear wheel for tyre changing and puncture repairing. No double belt rims to interfere with tyre levers, nor messy pedalling chains that are always in the way. No *free* wheels to get grit in their insides and grind themselves useless or cause the pedals to revolve and knock the heel off you when you don't expect it. The rear wheel is *free* in every way (which most, if not all, riders want).

I have had two three-speed hubs, and they both struck work on one or other of their gears, and I was left with two speeds.

I shall plump for the counter-shaft gear every time, which is the gear which must oust all others. In appearance, too, it is miles ahead of the hub type, and everyone I meet admires the appearance of the machine with the counter-shaft gear. The chain, of course, must be protected. It would be interesting to hear the opinion of others.

WILLIAM McLEAN.

Sir,—Having been an owner of eleven different motor cycles during the last ten years, might I be allowed to give my opinion on the controversy now taking place *re* hub and counter-shaft gears.

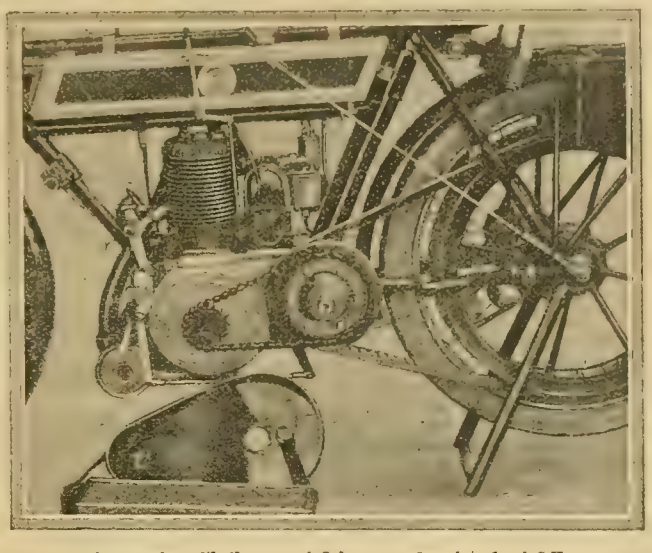
In 1911 I bought a three-speed Sturmey-Archer Premier for sidecar work, and which was very satisfactory with the exception of the belt, which would persist in breaking or pulling through every 140 or 150 miles. That, in itself, was not surprising, considering that I studied comfort before weight, and the latter was 402 lbs. In addition I weigh 11 stone, my wife 9 st. 6 lbs., and my son 3 st. 10 lbs., and my sidecar was seldom off.

We used our machine mostly for going to Worcester every week-end, *viâ* Newton, Bishop's Castle, Ludlow, Tenbury, and Witley = 75 miles, and the worst gradients were: 1 in 7, 1 in 8, two of 1 in 9, two of 1 in 10, three of 1 in 11, four of 1 in 12, three of 1 in 13, and four of 1 in 14. Except for adjusting the gears I experienced no trouble for the whole of 2,000 miles.

For 1912 I decided to fit a counter-shaft drive (as per photograph) solely to do away with the trouble of broken belts, and, strange to say, 1,100 odd miles were covered before the fastener pulled through. The drive I found was much more harsh than with belt alone, so much so that it burst the collar on hub spindle which locks into forkends and cone on left hand side.

A few words about the machine might be of interest, and also help to show what the hub had to stand.

The compression of my engine was originally high, but I made it higher by taking $\frac{3}{32}$ of an inch off the bottom of cylinder to give me a faster engine speed. My top speed was geared $5\frac{5}{8}$ to 1, and the bottom about $11\frac{1}{2}$ to 1, yet I could touch 38 to 40 m.p.h., with sidecar, owing to my enormous engine speed. The engine kept very cool, and knocked less than before, while carbon on piston was conspicuous by its absence.



The Premier with three-speed S.A. gear referred to by A.C.H.

Perhaps some of your readers can tell me why this should be, but I put it down to the auxiliary valve.

The counter-shaft drive was turned and screwed to fit in the bottom bracket, and, in addition to the two pinch bolts, was also held by a large nut on the right-hand side, which screwed up against the bottom bracket shell face. It had a $\frac{3}{8}$in. eccentric to allow for the chain adjustment, while the chain was $\frac{3}{8}$in. × $\frac{3}{8}$in. The pulley was 8in. diameter, cast solid, and was mounted on two large ball journals, and the large sprocket was bolted on the pulley. The two ends of the shaft were drilled and tapped $\frac{3}{8}$in. to allow for bolts holding back footrests for the footboards.

In the photograph the machine is shown with the chain case off, and inside this case are a funnel and pipe, which after catching the oil blown through the crank case release, allow it to drip on the chain, thus keeping it well oiled and in good condition.

Reverting to the first part of my letter, I absolutely agree with the two writers in your issue of August 21st, with the exception of the last sentence in "Through the Mill's" letter, which should read: "That the chain-cum-belt three-speed counter-shaft gear box has it all the time."

After selling the above machine I tried my hardest to get a three-speed counter-shaft gear box chain-cum-belt single-cylinder model and failed, and finally bought a three-speed all chain James, which is very satisfactory, although it wears out the back tyre 40% quicker than the belt model.

To sum up, I would not go back to the all-belt or counter-shaft and three-speed hub, neither would I have a two-speed counter-shaft gear box chain-cum-belt model (three speeds are essential for sidecar work), but if someone were to make a three-speed counter-shaft gear box chain-cum-belt single-cylinder model, well, I would sell my James to-morrow and order one, as, in my opinion, it is the finest transmission on the market.

I cannot make any statement as regards time for changing back tyres, as both jobs are easy to me, but would think it is quicker on three-speed hub models, because the controls are fixed easier and quicker than chain cases.

I have no interest in any motor firm whatever, but I am a motor mechanic of thirteen years' (ten in private service) experience, and all the above work was carried out by me entirely.

A.C.H.

Sir,—Our attention has been drawn to a widely published letter written by Mr. Paskell, of the Armstrong Triplex Three-speed Gear Co., in respect to the above controversy.

The deductions that Mr. Paskell makes are, from our point of view, altogether erroneous, and the percentages he gives altogether misleading, as regards the above controversy.

The question of the gaining of a gold medal in this trial was, to a great extent, a matter of pure luck. That is to say, if a rider happened to be sufficiently skilled to get round the hairpin bends he stood a very good chance of getting a gold medal. We do not think for one moment that anything beyond a very small percentage of any of the machines were incapable of climbing all the hills easily as regards the gradients, but it is admitted that the road conditions, owing to the excessively dry weather, were abnormal.

Mr. Paskell gives a 63% result of gold medals awarded to machines fitted with hub gears, and only 18% with other gears. We have stated above that it is only a mere chance as to whether a rider of either type would get a gold medal. A mere accident of a tyre or belt even would spoil the rider's chance. We could prove just as conclusively if it were a question of hub versus counter-shaft gear, that the counter-shaft gear is far and away better and shows a better result, as out of four machines of our make, all with counter-shaft gears, three obtained awards, showing a result of 75%.

Most of the marks which were lost and spoilt competitors' chances of gold medals were not due to trouble or inefficiency of either the engine or the gear, but due to accidents in tumbling off and breaking such things as control wires, and cutting up the tyres.

For strength and reliability it is only natural, we maintain, that the counter-shaft gear is far in advance of the hub gear.

THE LLOYD MOTOR ENGINEERING CO., LTD.

The A.C.U. Trials.

Sir,—I herewith enclose copy of letter which I have written to Mr. Loughborough *re* the recent Six Days Trial.

In my opinion this ill-advised trial has done more to set back the sporting side of motor cycling than anything in the whole history of the movement.

CHAS. H. R. NORRINGTON.

[Copy.]

Bowyers House, Longham, Wimborne,
Aug. 29th, 1913.

Dear Sir,—I desire to enter a protest against the manner in which the A.C.U. misled entrants for the Six Days Trial just concluded. To have stated in the preliminary regulations that no freak hills, abnormal or dangerous surfaces would be included, and then to take competitors over a course which included, as I am told by a local motor cyclist, all the known freak hills in the Lake District with the exception of two is scandalous. To require sidecar machines, or even solo, to average 20 m.p.h. over such a course and to perform the acrobatic tricks necessary to get around shows such a lack of commonsense that one can hardly credit the A.C.U. making such an absurd rule.

To expect a man to risk his neck, as undoubtedly everyone did, makes the whole trial a farce.

As a private owner, I was one of those who protested on Monday night, and it seemed to me that the protest was treated in a very light manner. Immediately the trade take the matter up concessions are made, but the officials do not meet the competitors at their meeting and reason the point, as they should have done, but grant a few bonus marks and some minutes' extra time. That in itself is far from satisfactory.

Seeing that the A.C.U. did not carry out their own statements on page 5 of the preliminary regulations, it is apparent the entry fees were obtained under false pretences.

I must request that my entry fee of £3 3s. be immediately returned to me, and I reserve the right to sue for expenses incurred whilst in Carlisle, including journey there and back.

Yours faithfully,

CHAS. H. R. NORRINGTON.

T. W. Loughborough, Esq.

Sir,—I have just returned from the hardest week's work in my life—the A.C.U. Six Days Reliability Trials.

Before the event I believed the aim and objects of the trials were:

1. To enable manufacturers to discover weak points in the design of their engines and the equipment of the machine.
2. To prove the all-round reliability of the modern motor cycle, and to act as a guide to prospective buyers in search of a powerful and reliable machine.

Let me say at once that I have been disillusioned. I will state my own experience briefly—which has been the case of many others.

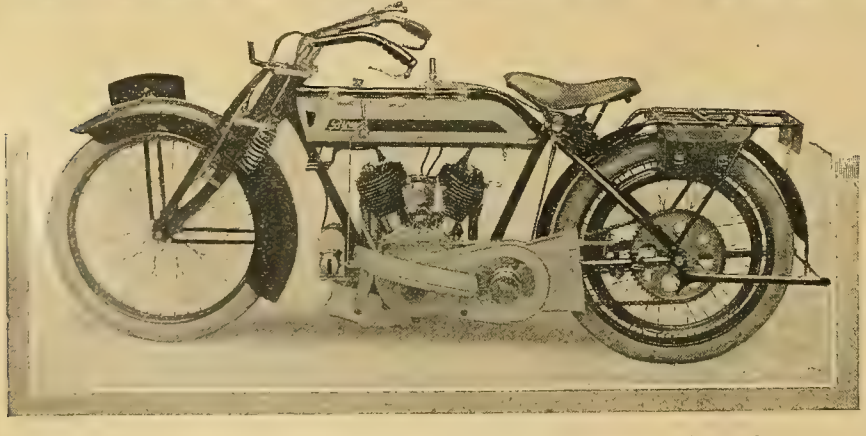
I made a clean ascent of every hill on the course. I arrived on time at every lunch control, and at Carlisle every night. I only stopped once in a non-stop section, through having run out of petrol. On the first day after the lunch control, at Keswick, I experienced some trouble with my clutch, and spent some little time in adjusting it, which I, however, made up later, and arrived at Carlisle on time. But I was twenty minutes late at Aughertree Fell, thus losing twenty marks. Now the point is this. If I had failed on every hill and stopped in every non-stop section each day, and arrived every night one and a half hours late, I should have obtained the bronze medal which the A.C.U. have awarded me. Is this a fair guide to the general public as to the best machine?

I do not quarrel with the judges or committee, and I was not a signatory of any of the numerous protests sent in. I consider that they acted in a fair and considerate manner throughout, hearing most patiently each case that came before them. The existing conditions are wrong, and the general opinion of the competitors is that it would be fairer in future to deduct one mark per minute over the fifteen minutes allowed. Surely it is absurd that being fifteen minutes late one has a clean sheet, and if only sixty seconds later you lose your gold medal.

In conclusion, I would say that my machine was the oldest of the lot, and has done about 11,000 miles, and weighs 2 cwt 56 lbs. all on. I maintain, therefore, that in awarding a bronze medal for any performance similar to mine, the objects of the trials have been defeated.

FRANK MAY (NO. 93).

[Since the above was written Mr. May's award has been changed to a silver medal.—Ed.]



A new model 6 h.p. twin Brough which is fitted with chain drive and two-speed counter-shaft gear.

Testing Benzole.

Sir,—I notice in *The Motor Cycle* a letter, signed F. E. Thomas, on "Benzole." In his letter he states the benzole he uses is 90% spirit, also he says that he tests this himself. I should esteem it a favour if he would kindly say how and by what means he does this, and I am sure it would confer a boon to many readers of your valuable paper.

ARTHUR FISHER, R.P.C.

The Motor Cycle as an Aid to Business.

Sir,—Having heard a good deal about the use of motor cycles for business purposes in *The Motor Cycle*, I send you a photograph of a Rex Sidette which I have for some months used for the purpose of delivering bread, and after a fair

E. Woolgrove, who uses his 6 h.p. Rex sidecar for business purposes, as mentioned in accompanying letter.

trial in all weathers I find it most useful. It is very easy to start and control, and is quite a novelty in the district. The machine can be seen at work almost any day in and around Bedworth. E. WOOLGROVE.

Consideration.

Sir,—On Wednesday, September 3rd, the quiet village of East Meon was invaded by a noisy horde of some twenty or more motor cyclists and cycle carists, hailing from Southampton and Portsmouth. They came, presumably, to hold a hill-climb on a hill some two miles from here; but from 2 p.m. until nearly 7 p.m. our narrow and twisty High Street scarcely ever seemed to be free of them. I am a motor cyclist myself, and from my knowledge of the dangers of our street I am sure that it is not a safe one to traverse at a higher speed than 15 m.p.h. Most of these persons careered through it at speeds nearer 25 or 30 m.p.h., and practically all with cut-outs open. I am no spoil-sport, and quite believe in the value of club outings and hill-climbs, but I do think that secretaries might try to restrain the rowdy element in their clubs from actions of this kind. Might I suggest to the wearers that red night-caps, however becoming to the head when it is on a pillow, are just a little ridiculous when worn inside a racing cycle car; and that a tartan tam o' shanter surmounting motor goggles makes its owner look—to put it mildly—something of a jackass. AA 1160.

Motor Cycle Taxation in France.

Sir,—In a recent issue I noticed a paragraph *re* the taxing of motor cycles in France which might lead your readers to think that some change has been made. This is not the case. Motor cycles and bicycles are, and have been for many years, treated in the same way. Every cyclist or motor cyclist has to obtain, before January 1st of each year, a plaque, which must be fixed to the head of the machine. A plaque has to be affixed for each person the machine may carry; for instance, a tandem bicycle has to have two plaques, and a motor cycle with sidecar will have to have at least two plaques. The plaque for a bicycle costs 3 frs., and that for a motor cycle 12 frs.

There has been some difficulty with the authorities as to what is a motor cycle. Many years ago, I think in 1899, the Chambre Syndicale des Cycles et de l'Automobile was asked by the authorities, owing to the very large quadricycles that were being constructed, to define a motor cycle. This was carefully considered, and the definition accepted was that a motor cycle must have means of propulsion by pedals. This, of course, brought the modern motor cycle having no pedals into the category of an automobile. This question was brought before the authorities in July of last year, and I must say that the deputation representing the manufacturers, of which I had the honour to be a member, was received in the kindliest manner.

The changing of any law is, I suppose, in every country a lengthy matter, but we have recently been informed that, subject to confirmation by the Conseil d'Etat, we may consider that all motor cycles, with or without pedals, will be only taxed as motor cycles. I may say that during the past year no action, so far as I know, has been brought against motor cyclists having machines without pedals.

Although not so far advanced, I believe I may say that we shall be shortly successful in getting the tax on cycle cars not weighing more than 300 kilos. fixed at a much lower rate than is at present the case, probably 40 frs.

F. G. FENTON.

Dispensing with a Differential.

Sir,—In reply to Mr. R. D. Dunlop, I beg to state that over-running clutches have been very frequently used on experimental cars. One cycle car was recently fitted with this arrangement, which has now given place to a construction in which a solid axle is used, one wheel being fixed to the axle whilst the other is coupled to the axle by a friction clutch. Incidentally, a good illustration of this type appears on page 438 of *The Autocar* for September 6th.

The automatic clutch gear was frequently suggested in the early days of motor cars, when a light motor vehicle was a motor car. I do not know any case where it was actually used, and my article does not suggest that this was the case. This construction was merely described as a substitute for a differential gear. ERIC WALFORD.

Power for Sidecar Machines.

Sir,—From the letter of Mr. Walburn, published in your issue of the 4th inst., it would appear that he did not read the article in your journal on the Scottish Six Days Trial. A doubt was there expressed whether the 3½ h.p. Bradbury and sidecar would have done so well in other hands than Mr. Gibson's, and Mr. Gibson's record is so good, and his performance in this case so excellent, that one is indeed more impressed by the personal skill exhibited by the driver than by the qualities of the machine. That seems to be the view taken in your article, and it certainly was mine, hence my expression of regret that there was not an opportunity of seeing what a 3½ h.p. motor cycle and sidecar would have done in ordinary hands in this trial.

Without any prevous experience I went in July last year on a trial run with a 3½ h.p. Humber and sidecar with a passenger and luggage, and selected North Wales for our tour. I drove 800 miles in the week, took all the hills we came across, including the Berwyn mountains, which we went over at nine o'clock one night, and which I have since seen illustrated in your journal as being a severe climb, had no trouble, and went 80 m.p.g. This experience as a complete novice satisfied me as to some of the capabilities of the 3½ h.p. and of my choice of machine, but, after all, this is child's play compared to a run like the Six Days Trial, in which, unfortunately, owing to an accident, I was unable to take part. Mr. Walburn does not appear to appreciate the difference between driving 900 miles a month under normal conditions and 600 miles in six days under the special conditions of the Six Days Trials.

CHARLES D. WRIGHT.

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost and Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we have decided to keep a list of such articles, and all that are notified to us will be inserted in this list. Should we receive a letter from the finder which corresponds to the article lost, the two persons will be put into communication, but it must clearly be understood that we cannot enter into correspondence on the matter beyond this.

SPEED TRIALS AT GAINSBOROUGH.

Successful Meeting held by A.C.U. (East Midland Centre).

THE officials of this centre of the A.C.U. are to be congratulated on the successful meeting which they held on Saturday last. The various officials worked well and stuck to the posts allotted them, with the result that there were no irritating waits. It is as well there were not, for racing did not conclude till after six o'clock, a start having been made at one o'clock.

Sir Hickman Bacon, Bart., very kindly lent a private road leading to his estate, Thonock Park, Gainsborough, for the meeting, and took a great interest in the various events and machines. Sir Hickman is a pioneer motorist himself, and he appeared to find the racing motor cycles as interesting as cars. The surface of the road was admirable for the motor cycles, but there was rather a sharp camber, which, as the road was rather narrow, proved a difficulty for the only two racing cycle cars entered.

There was quite a large attendance of the public, rails which ran down the side of the road forming a fine barrier and at the same time a sort of grand stand. Cinematograph operators were on the spot, and the crowd were evidently hugely pleased when the machine was directed on them. Mr. Loughborough was in attendance, and he soon found his services utilised as a timekeeper, for the car conveying the timekeepers from Nottingham took the longest course from Newark and arrived an hour or so late.

The Passenger Machines.

The sidecar class amused the spectators, as some of these fitments were of the most curious shapes. One sidecar was a practically exact model of a soup tureen, and much amusement was caused by someone asking if the passenger would like the lid on!

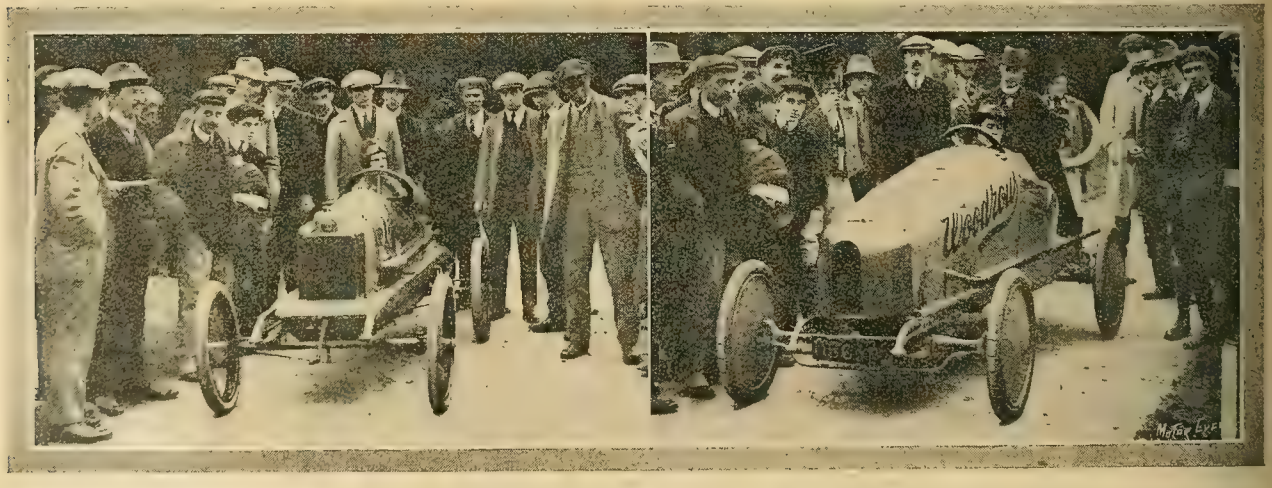
The two cycle cars engaged were a Calthorpe Brooklands racing model, with a highly polished aluminium speed body and the most beautifully finished little honeycomb radiator, and a newcomer to racing, the Woodrow, named after its maker. It had a racing single-seated body and disc wheels. The power unit was a twin J.A.P. (90 mm. × 77 mm.) with overhead valves, the engine being set across the pressed steel frame, the drive being then taken by shaft to the gear box and thence by overhead worm to the rear live axle. It was a very pretty little machine, but appeared to be geared too high. The silencer was set across the frame at the rear, and one exhaust pipe was taken along each side of the frame to it. On its last run down the course it appeared likely to get out of hand and wobbled in rather a terrifying manner, and the driver told us he found on finishing that he had jumped the shackles of his front springs in returning to the starting post after his first run along the grass track provided for this purpose. Thus the front springs were useless. G. W. Hands seemed rather uncomfortable on the Calthorpe, and he complained to us that he found steering at speed very tricky where the road was cambered. On his last run he gave up the wheel to another driver, who improved on the previous time by a couple of seconds.

B. Rhodes, Lincoln M.C.C. (8 h.p. Zenith), who was the most successful competitor of the meeting. He is shown winning the sidecar event.

The sidecars in the standing start events, it is interesting to note, beat the racing cycle cars, the fastest time in the sidecar sections for the half-mile being done by B. Rhodes on a 986 c.c. Zenith in 38⅘s. against G. W. Hands, on a 1,086 c.c. Calthorpe racer, 39⅖s.

An Exciting Duel.

Everyone was allowed two runs in each event, and the fastest time counted. Naturally the greatest interest was taken in the big classes, and B. Rhodes, on a Zenith, and G. Brough, on a machine of his own make, had a rare tussle. In the flying start half-mile both men tied with 25s. dead, and on the run off another dead heat followed in 25⅖s., so a third try was arranged, when the Zenith rider, by superior acceleration at the start, won somewhat easily in 25⅗s. against Brough's 26⅗s. The Gradua gear was undoubtedly the agent to be thanked, as at the finish Brough seemed to be rather the faster. These were the highest



A.C.U. EAST MIDLAND CENTRE SPEED TRIALS.

(1) G. W. Hands on the 8-10 h.p. Calthorpe, winner of the experts' class in the cycle car race.

(2) J. Woodrow (Woodrow cycle car), who won the "general" section of the same event.

Speed Trials at Gainsborough.—

speeds of the day, 25s. being equal to a mean speed of 72 m.p.h. All events were run over a measured half-mile. Details of the racing are as follows :

EVENT 1.—Motor cycles not exceeding 350 c.c.

Experts.—1, F. G. Edmond (2 Humber, 345 c.c.), 40⅖s. ; 2, J. R. Sylvester (1 New Hudson, 293 c.c.), 43⅖s. ; 3, J. Cocker (1 Singer, 299 c.c.), 44⅖s.

General.—1, J. R. Sylvester (1 New Hudson, 293 c.c.), 43⅘s. ; 2, H. F. Barr (2 Humber, 239 c.c.), 52⅗s.

EVENT 2.—Motor cycles not exceeding 500 c.c.

Experts.—1, J. Cocker (1 Singer, 499 c.c.), 36⅘s. ; 2, N. O. Soresby (1 Rudge, 499 c.c.), 41¼s. ; 3, E. Hawkes (1 Rudge, 499 c.c.), 42⅗s.

Cocker broke his pulley just as he finished his first run, but his time gave him an easy win, so his second try was not wanted.

General.—1, H. O. Wood (2 Scott, 486 c.c.), 38s. ; 2, F. Lamb (1 Premier, 499 c.c.), 38⅕s. ; 3, W. F. Waddington (1 Campion-Precision, 499 c.c.), 38⅘s.

The Tourist Trophy winner's machine gave him a little trouble to start, but, once under weigh, it ran with a beautiful note and swept over the line at a tremendous pace, and everyone seemed to be delighted at the apparently effortless manner in which it ran.

EVENT 3.—For the East Midland Centre A.C.U. Challenge Trophy. Open to clubs affiliated to this centre of the Union who nominated teams of three riders mounted on machines of 350 c.c., 500 c.c., and 1,000 c.c. respectively.

The Lincoln, Nottingham, and North Derbyshire Clubs competed, the latter having two teams engaged. The result was arrived at by giving marks for each of the three sized machines, thus the fastest 350 c.c. was credited one mark, the second fastest two marks, and so on through the other sizes. Thus the club scoring the lowest number of marks won. Actual fastest time was done by George Brough, of the Nottingham Club, on a twin Brough, in 32⅖s., and in the result the Nottingham Club proved the winners, the results being as follow :

1. NOTTINGHAM M.C.C.

Rider and machine.	Time.
J. R. Sylvester (1-cyl. New-Hudson, 350 c.c.)	42⅖s.
N. O. Soresby (1 Rudge, 499 c.c.)	41⅗s.
G. Brough (2 Brough, 998 c.c.)	32⅖s.

Total marks, 4.

2. NORTH DERBYSHIRE M.C.C.

W. Bown (2 Douglas, 350 c.c.)	44⅖s.
A. Clay (1 Triumph, 499 c.c.)	38⅕s.
R. Carter (2 Brough, 998 c.c.)	35⅘s.

Total marks, 6.

3. LINCOLN M.C.C.

H. F. Barr (2 Humber, 350 c.c.)	50⅘s.
E. Allwood (1 Triumph, 499 c.c.)	42⅘s.
B. Rhodes (2 Zenith, 986 c.c.)	32⅘s.

Total marks, 10.

4. NORTH DERBYSHIRE M.C.C. (second team).

O. Smoothy (1 Singer, 350 c.c.)	45s.
G. Dearle (1 Triumph, 499 c.c.)	42s.
W. Waddington (2 Campion, 1,000 c.c.) ...	38s.

Total marks, 10.

EVENT 4.—Motor cycles not exceeding 1,000 c.c.

Experts.—1, B. Rhodes (2 Zenith, 986 c.c.), 31⅕s. ; Rhodes had a walk over.

General.—1, B. Rhodes (2 Zenith, 986 c.c.), 31⅗s. ; 2, G. E. Sanders (2 Indian, 994 c.c.), 34⅗s. ; 3, L. W. Forrington (2 Indian, 994 c.c.), 35⅘s.

Rhodes found his Gradua gear very useful for acceleration at the start and gained a considerable advantage thereby.

EVENT 5.—Motor cycles and sidecars any c.c.

Experts.—1, B. Rhodes (2 Zenith, 986 c.c.), 43⅖s. ; Rhodes had a walk-over.

General.—1, B. Rhodes (2 Zenith, 986 c.c.), 38⅘s. ; 2, A. W. Grocock (2 Zenith, 770 c.c.), 42⅗s. ; 3, R. Lucas (1 Triumph, 499 c.c.), 47s.

EVENT 6.—Cycle cars.

Experts.—1, G. W. Hands (4 Calthorpe, 1,088 c.c.), 39⅖s. This was a walk over.

General.—1, J. Woodrow (2 Woodrow, 986 c.c.), 49⅗s. Another walk over.

Both cycle cars seemed to be steered with difficulty, and wobbled alarmingly. The Woodrow appeared to be overgeared, and made a very slow start.

EVENT 7.—Motor cycles, sidecars, and cycle cars, any c.c. Flying start.

Experts.—1, B. Rhodes (2 Zenith, 986 c.c.), 25s. ; G. Brough (2 Brough, 998 c.c.), 25s. ; 3, G. W. Hands (4 Calthorpe, 1,088 c.c.), 30⅖s.

Brough and Rhodes ran off again and dead-heated a second time in 25⅖s., but on the decider Rhodes got off the faster and won in 25⅗s. against Brough's 26⅗s.

General.—1, G. Brough (2 Brough, 998 c.c.), 25⅕s. ; 2, B. Rhodes (2 Zenith, 986 c.c.), 25⅘s. ; 3, G. Williamson (2 Indian, 994 c.c.), 27⅘s.

It will be seen that B. Rhodes was by far the most successful competitor. His big Zenith ran wonderfully well throughout the afternoon, and his Lincoln clubmates were very delighted at his frequent successes. The weather was delightful, except for one short shower early in the afternoon. Lunch was provided by the Leicester Rubber Co., makers of the John Bull tyre.

H. O. Wood (3½ h.p. Scott), this year's Senior T.T. winner, who won the "general" section in the 500 c.c. class, awaiting the signal to start. Behind him is W. L. Guy, another Scott rider.

A.C.U. SIX DAYS' TRIALS.

THE JUDGES' REPORT.

ENTRIES.—The entry of 162 machines was a record for A.C.U. trials, and it is satisfactory to be able to state that only one of the entrants out of this record number failed to start.

INTERNATIONAL TOURING TRIAL.—This trial very appropriately included the first International Touring Trial held since the resuscitation of the *Fédération Internationale des Clubs Motocyclistes*. In view of this, the classification of the entrants was made according to the F.I.C.M. ruling. This led to some apparent anomalies, such as the inclusion of three-wheeled cycle cars among the sidecars and the limitation of their engine capacity to 1,000 c.c. Only two entries, namely, one from France and one from Great Britain, were received for the International Touring Trial. The members of the French team were probably unaware of the difficulties that they had to face, and their machines were unsuitably geared. The judges hope, however, that their want of success will not deter them from entering future A.C.U. trials, at which they will always receive a hearty welcome.

The British team, composed of Messrs. Gibb, Little, and Collier, deserve the most hearty congratulations, not only on their victory as a team, but also on the excellence of their individual performances.

COURSE.—A very stiff course was selected, with Carlisle as a centre. There were many long and trying hills with bad corners and bends, and places with very rough surfaces. Some of the roads were narrow, but not too narrow for motor cars to go round the whole course. The modern motor bicycle has such great hill-climbing powers that it is extremely difficult to find hills that are any real test for it unless steep gradients are combined with sudden turns and poor surfaces.

The competitors, however, may congratulate themselves that they did not have to traverse such bad stretches of roads as are found in the neighbourhood of London or Paris, many of which are far more trying for frames than those actually encountered in the Trials.

The routes selected were calculated to develop the machine which will go anywhere, rather than the mere high speed machine.

WEATHER.—Three of the running days were fine and two were wet, with high winds.

ROADS.—Dry and dusty for the first three days. Wet, heavy, and generally greasy on the last two.

FAILURES AT WATERSPLASHES.—The judges regret that so many failures occurred in these. There are so many splashes, within 25 miles of London, for instance, that it should be possible for machines to go through them with impunity. Magnetos, however, appeared to be more nearly waterproof than at the previous Six Days Trial.

AWARDS.—The following is a summary of the awards :

	Class	Entries.	Medals. Gold.	Silver.	Bronze.	Retirements.
Div. 1	B	18	4	2	3	9
	C	61*	27	5	14	14
	D	26	6	7	7	6
	E	16	7	1	1	7
Div. 2	G	1	—	—	—	1
	H	13	4	3	—	6
	I	18	2	2	2	12
Div. 3	K	9	1	1	—	7
		—	—	—	—	—
		162*	51	21	27	62

*One non-starter.

NOTE.—If the original regulations had not been relaxed there would have been earned, so far as it is possible to judge, a total of 36 gold, 36 silver, and 27 bronze medals.

NUMBER OF RETIREMENTS ON VARIOUS DAYS.—Monday, 12; Tuesday, 17; Wednesday, 16; Thursday, 10; Friday, 7. Total, 62.

WEIGHTS.—The published weights tell their own tale—possibly, in some cases, to the surprise of the entrants.

GEAR RATIOS.—The figures published afford very interesting reading. The judges are of opinion that the low bottom gears generally fitted are not in any way "freak" gears, but form a very valuable asset, not necessarily for straightforward hill-climbing, but for emergencies.

TRANSMISSION.—A great increase is to be noted in the number of machines with all-chain drive or belt and chain drive. The premier award went to a machine on which the chains ran in an oil bath.

CYCLE CARS.—The cycle cars which finished the course are worthy of the highest commendation, not only for their performance, but also for the condition in which they finished. Many of those which gave up were not really eliminated by the severity of the course, but by engine troubles.

RIDERS.—The majority of the riders were very expert, which makes it all the more difficult to find hills that are sufficiently stiff to test their machines. A certain number of competitors showed poor judgment in not changing down soon enough, or in taking corners too fast.

APPEARANCE OF RIDERS.—The fact that marks were to be deducted for appearance had a most marked effect, as practically no riders wore outlandish costumes, but were content to wear workmanlike clothing suitable for the weather conditions met. A few, however, who carried oil tins, etc., on their persons had to be penalised.

APPEARANCE OF MACHINES.—This was a difficult point on which to judge, as so many competitors cleaned their machines as they went along. Many, however, gave evidence of too much oil leakage.

CONDITION OF MACHINES.—For the first time in the A.C.U. trials a whole day was devoted to the examination of the machines at the conclusion of the trial. When it is remembered that the judges had to examine 100 machines in the space of seven hours it will be obvious that the examination could only be an external one, and in some respects superficial. It is probable that from this cause a certain number of defects failed to be observed by the judges, but much interesting matter was brought to light.

To get a real criterion of the conditions of the machines it would probably have been necessary to ride each of them for a short distance to see how the engines pulled and what condition they were in. The report on the condition of the individual machines will be sufficient to make clear the nature of the majority of the defects. Some of the defects noted are of a trivial nature, and surprise may be expressed that notice should have been taken of them. On the other hand, this appears to be a good opportunity to bring to the makers' notice the fact that these small defects do take place so that they can be remedied.

A few of the more important defects may be noted in general here :

ROAD WHEELS AND VARIABLE SPEED GEARS.—Damaged.

PETROL TANKS.—Leaky.

WIRE CONTROLS.—These were broken or defective in many cases. The faults would appear to lie with the faulty fitting rather than with the system.

BICYCLE PARTS.—Many of the hub bearings and steering heads were loose. Many motor bicycles have no provision for lubricating the steering heads.

SPRING FORKS.—On some of these there was considerable lateral play, while others of exactly the same design remained in good order.

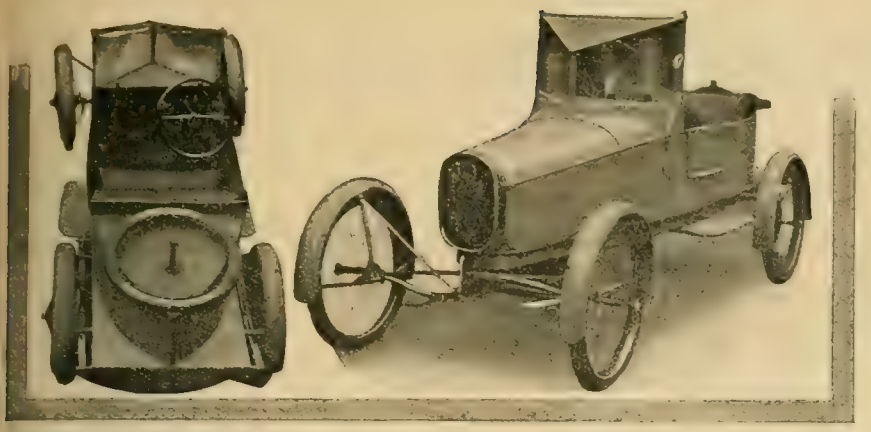
FRONT BRAKES.—Many of these at the final examination were found to be inoperative, or practically so.

MAGNETO CONTROLS.—In far too many cases these were partially or wholly jammed.

Several machines had suffered from falls or collisions, and allowance as far as possible was made for these in the marking. The judges regret, however, that in a few machines vital parts of the control mechanism should still be attached to foot-rests, foot-boards, etc., which are bound to suffer if a machine falls. A fall should not adversely affect parts necessary for driving and control.

ACCELERATION AND FLEXIBILITY TESTS.—These were a new feature. The tabulated results will well repay the time spent on their examination, as they afford in a concise form valuable information respecting important features in a touring machine. The careful observer will note that the schedules of speeds set for the various classes of machines were accurately forecasted, with the result that the average figure of merit for each class is practically identical

(Signed) A. E. DAVIDSON, Capt. R.E.
ARCHD. SHARP.



The Carter cycle car which has a four-cylinder engine 50 × 94 mm., and can be started from the seat through an overhead camshaft.

THE CARTER CYCLE CAR.

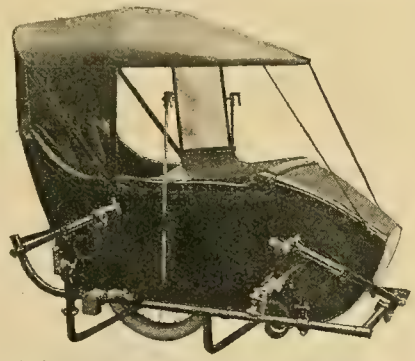
Our illustrations show an interesting cycle car in course of construction at the present time. The engine has four air-cooled cylinders with a bore and stroke of 50×94 and overhead valves. The valves are operated by a central overhead camshaft driven by chain, the shaft lying between the valve pockets and being used also as a starting shaft, a handle protruding through the dashboard for this purpose. A fan is fixed on each end of the camshaft for cooling purposes, and each valve is detachable complete with spring and pocket. The drive is by friction through a fibre faced flywheel to a steel wheel on a counter-shaft, six speeds and reverse being provided, and large thrust bearings being used throughout. Chain drive is employed to one rear wheel, an intermediate counter-shaft being used to give a reduction and divide the chain length. A friction plate is used in the rear axle instead of a balance gear. Springing is semi-elliptical at the rear and by a single cross spring in front. The whole front axle is pivoted centrally, and in the first model direct steering is used, but this will probably be replaced by rack and pinion. The frame consists of a single piece of pressed steel somewhat in the shape of a narrow U, and the whole construction is extremely light and accessible. A neat sheet metal body is fitted, and a V shaped wind screen, the total weight being about 4½ cwt. It is made by Mr. Carter, of Selly Oak, Birmingham.

A STURDY TYRE.

For some time past we have been using a 2½in. Palatine tyre on the rear wheel of a single geared 6 h.p. machine. It will be remembered how well one of these tyres performed in a 3,000 miles R.A.C. trial, and the one we have in use bids fair to last considerably over this mileage. At the present time it has travelled something over 2,000 miles, and the grooves are still well defined, while the sum total of trouble has been one puncture caused by a very long sharp flint. Besides this there is only one slight cut in the tread, and from the looks of the tyre we should say it has quite another 2,000 miles life. However, on this subject we hope to say more later on when the tyre has completed a considerably greater mileage.

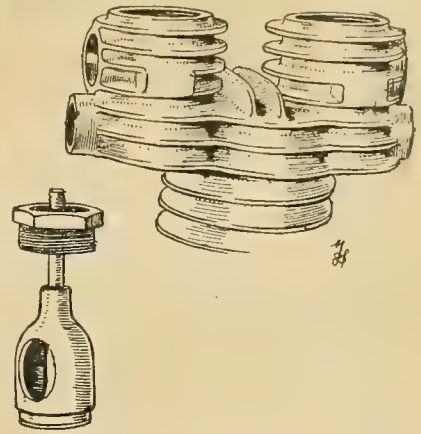
A NEW MODEL SIDECAR.

The P.M.C. Model No 21 is the description applied to the very serviceable sidecar which we illustrate herewith. It has been specially designed to suit the spring



A new model P.M.C. sidecar which was primarily designed for use with spring frame Indians.

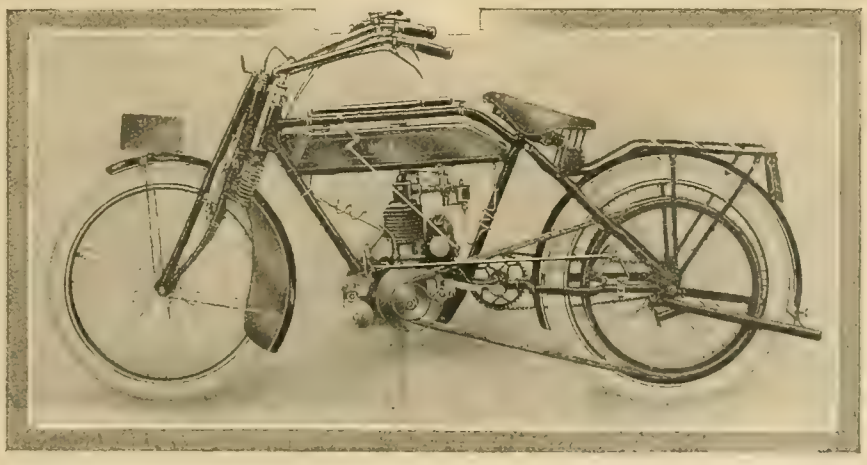
frame Indian machines, and, as will be seen, has five points of attachment. These attachments are, of course, of the well-known Quickfit type, which are one of the firm's specialities. The chassis is carried right round the body and carries lugs on which the springs are mounted, thus saving the frame from rubbing friction. The five point attachment ensures perfect rigidity, and the central front chassis attachment is an excellent feature. The coachbuilt body is well carried out, and the hood may be easily raised or lowered by the passenger without leaving the sidecar, and side curtains can be supplied at a small extra charge. This type of sidecar can be supplied to suit almost any make of machine. The Premier Motor Co., Ltd., Aston Road, Birmingham, are the manufacturers.



Cylinder head and valve pocket of Carter engine, showing detachable valve seating.

A LOW-PRICED LIGHT-WEIGHT.

The Wulfruna Engineering Co., of Wolverhampton, have decided to market a 2½ h.p. motor cycle which, though fitted throughout on the best modern lines and neatly finished, is to sell at 24 guineas. The engine, which the firm have tested throughout the last twelve months, has an overhead inlet valve, and is fired by an enclosed magneto placed behind the cylinder, either Amac or Senspray carburetter being fitted at option. Footrests, brakes, carrier, and control are all of approved pattern, and Pilot spring forks are used, the wheels being shod with 26in. × 2in. tyres. For 32 guineas the machine may be fitted with either Sturmey-Archer or Armstrong three-speed gear, handle starter, and large footplates.



The 2½ h.p. Wolf lightweight, which is being marketed by The Wulfruna Engineering Co., of Wolverhampton. Its chief features are low cost, overhead inlet, and enclosed magneto.

Paris-Nice Trial.

Rex Mundy has received a cheque from *L'Aero* for 500 francs (£20) as the first award in the Paris-Nice trial.

Accident to Well-known Rider.

It is very much to be regretted that S. L. Bailey's return to this country should be almost immediately followed by a nasty accident, which he suffered on the day of last week's speed trials at Wimborne. We wish him a speedy recovery.

Bad Roads in the West Country.

The West-country route from Andover, *via* Amesbury, Hindon, Mere, and Wincanton, is in very bad condition and practically impassable for motor cycles, as the road is very much cut up through heavy military traffic. Motor cyclists should travel *via* Salisbury and Shaftesbury.

Coventry and Cut-outs.

Last week the first prosecution under the Act prohibiting cut-outs was brought in Coventry and a conviction ensued, though but a nominal penalty was inflicted. The case was interesting, inasmuch as the police constable who brought the prosecution showed both a knowledge of the Act and of the technical construction of motor cycle silencers. The point on which the defendant was convicted was that the cut-out lay between the exhaust port and the silencer.

A Valuable Discovery.

During the past few weeks the Petrol Substitutes Joint Committee has discovered a process by means of which it is hoped that fully 40,000,000 gallons of British motor spirit will be available annually without further depleting the country's mineral resources. Briefly the process claims to extract a high percentage of efficient motor spirit from a commodity at present produced in this country in enormous quantities, but hitherto quite unsuitable for motor car fuel. Full and most careful investigations have been carried out by the committee's experts, and so far as a small demonstration plant is concerned, the results are excellent. It is confidently hoped that the full-sized commercial plant now in course of building will be equally successful.

Speed Trials.

It is somewhat of a coincidence that descriptions of speed trials held in the North, South, and East appear in this issue.

A Level-minded Statement.

The coroner for Birmingham (Mr. Isaac Bradley) recently remarked that he did not think there were more accidents now than there used to be before the advent of motors, but more attention was paid to motor accidents. People had to get accustomed to motors as they had got used to bicycles.

The Motor 'Bus.

What will our roads become like when motor 'bus journeys are undertaken from town to town all over the country? Is it not time these public service vehicles paid a sum commensurate with their weight and road destroying capacities?

S.E. motor cyclists will be relieved to hear that a projected service of motor 'buses to Westerham, *via* Bromley, and Cudham, has been abandoned owing to the state of the roads.

SPECIAL FEATURES:

SPEED TRIALS:
NORTH, SOUTH, AND EAST.
THE JUDGES' REPORT OF THE A.C.U. TRIALS.
ASCENT OF SKIDDAW.

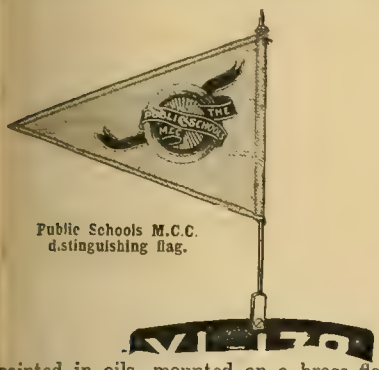
Record Turnout for Club Run.

America is noted for never doing things by halves, and it evidently extends its enthusiasm for big things to motor cycle club outings. Recently the Los Angeles Motor Cycle Club held its annual run to Venice, Cal., which is only twenty miles from Los Angeles. Over 1,700 motor cycles turned out for the run, carrying between them over 3,400 people, 90% of the machines having passengers, generally of the fair sex, on the carrier or sidecar, and sometimes on both. So great was the number of riders that the first machines had arrived at their destination before the last ones had departed. Four years ago the members of the club numbered four hundred, and it is expected that there will be two thousand next year.

THE HALF-WAY HUT ON SKIDDAW.
W. B. Little (3½ h.p. Premier) passing through the gate during the ascent. One minute over the hour was required for the six-mile climb to this point. (See pages 1196 and 1197.)

A Distinguishing Flag.

The Public Schools M.C.C. has brought out a flag, by means of which members may be distinguished. This flag is red, with the crest of the club



Public Schools M.C.C. distinguishing flag.

painted in oils, mounted on a brass flag-staff, and is designed to clip on to the number plate.

The club, which, though young, is very energetic, is entering a team to compete in the Streatham and District M.C.C. speed trials at Brighton on the 20th inst. The following have been invited to compose the team: Victor Wilberforce (3¾ Douglas), R. L. Keller (3½ Triumph), E. Tallboys-Getting (8 Bat) and A. J. Luce (8 Bat sc.). After the speed trials it is proposed that the party should proceed to Dymchurch for the week-end.

Reckless Driving at Harrow.

The Surveyor of the Harrow Urban District Council has complained to the A.C.U. about frequent dangerous driving about Harrow-on-the-Hill.

The Special Reserve in Liverpool.

The Liverpool Amateur M.C.C. is holding a special meeting at the Imperial Hotel, Liverpool, at 7.30 p.m. on September 17th, in conjunction with Capt. Apletre, secretary of the West Lancashire Motor Cycle Committee, who will explain fully to all motor cyclists who attend the details of the War Office scheme for the Special Reserve of Motor Cyclists.

Accident to Prominent Scottish Official.

An unfortunate accident somewhat damped the spirits of the competitors and officials at the Scottish speed championships at St. Andrews on Saturday last. On the Friday evening several of the leading officials, after having made all the arrangements, retired to their rooms shortly after midnight. About 2 a.m. Mr. Campbell McGregor was discovered by the hotel boots in a well adjoining the hotel, having, it is conjectured, fallen out of his bedroom window, a distance of thirty-five feet. Mr. McGregor sustained severe injuries, both internal and external, but the latest report is that he is gradually improving.

Awards in the Six Days Trials.

We regret that an inaccuracy occurred in the amended list of A.C.U. Six Days Trials medal winners, published last week. J. D. Drysdale, who rode a 5-6 h.p. Hazlewood, is mentioned as winning a silver medal. This should have been stated to be a gold medal. Thus both the new 5-6 h.p. Hazlewood machines which competed in the trials gained the coveted highest award

FUTURE EVENTS

„ 11.—B.M.C.R.C. Meeting and A.C.U. Championships.

The Army Manœuvres.

The Auto Cycle Union has been requested by the Chief Constable of Bucks to warn motor cyclists to avoid the roads as far as possible round Wendover, Chalfont St. Peter, and Leighton Buzzard during the forthcoming army manœuvres. These roads are narrow, and large bodies of troops and service waggons will be on these roads almost continuously during the military operations.

Coventry and Warwickshire M.C. Hill-climb.

The following classes have been arranged for the above club's eighth annual open hill-climb:

Class 1.—Touring lightweights up to 350 c.c.

Class 2.—Standard touring machines exceeding 350 c.c., but not exceeding 500 c.c.

Class 3.—Variably-geared machines—*(a)* up to 500 c.c., *(b)* over 500 c.c.

All the above classes are expert barred.

The following are open classes:

Class 4.—T.T. machines up to 500 c.c.

Class 5.—Cycle cars and sidecars.

Class 6.—Any motor bicycle.

Prizes will be awarded in each class for the best performance on formula and fastest time. A special team prize is also offered for teams of three (club, manufacturers', or agents' team), and a separate run will be allowed in each class.

Further particulars may be obtained from the organising secretary, Mr. J. F. Spencer, Priory Street, Coventry.

A Pressmen's Handicap at Brooklands.

At the B.M.C.R.C. meeting on Saturday next a Pressmen's Handicap will be included. The prizes will consist of medals. Further details will be published in the programme.

MOTOR CYCLISTS AND THE MILITARY MANŒUVRES.
Outposts of the 1st Batt. Rifle Brigade, near Winslow in North Buckinghamshire. The machine is a 3½ h.p. P. and M. and sidecar.

TOURING TOPICS.

A Trip to Rosedale Abbey and Rosedale Abbey Bank.

EVERY now and again mention is made of a really stiff hill called Rosedale Bank or Rosedale Abbey Bank, the foot of which is situate in a magnificent valley on the north-east Yorkshire moors. The hill runs direct from the little village of Rosedale, at one time possessed of an abbey, but very little now remains. From what little information I could gather, I find that the hill rises from about 550 feet to nearly 1,000 feet in close on one mile; the surface is atrocious, being a mass of loose stones, fortunately not of the sharp variety, but which have been ploughed up into ridges by the slipper brakes of carts, and woe betide the motor cyclist who enters one of the ruts.

There are two very nasty bends, both worse than right angles, and the stiffest gradients appear to be just on rounding the first bend and shortly after the second. There are also three or four awful gulleys running diagonally across the road, made of a species of small paving stones, on which a low built machine is in danger of damaging its crank case.

In its present condition the hill is not worth riding, but, nevertheless, there are some who think it their business to try all the freak ascents they can, and I was one of a party who succeeded in taking a 3½ h.p. Bradbury and a 3½ h.p. Premier, both with empty sidecars, to the top. The ascents were not made non-stop, but they were very good.

A trial was then made with passengers, but was a complete failure owing to the driving wheel refusing to grip, and on every occasion the combination came to a standstill with the back wheel whizzing round. Apart from the hill, the run to Rosedale is well worth taking, the road is good, and on either side there are towering hills, at this time of the year bedecked with gorgeous purple heather.

The first really bad corner of Rosedale Abbey Bank. Note the loose state of the surface.

A portion of Rosedale Abbey Bank. The photograph does not give the full idea of the gradient, but shows the deep ruts caused by the slipper brakes of carts. These ruts have to be crossed in several places as they are found on both sides of the road.

I believe a good road can be taken from Pickering, *viâ* Wrelton Hall and Cropton, but certainly the following road leaves nothing to be desired.

How to Reach Rosedale.

Start from Kirkby Moorside and proceed as if to Pickering; about two miles out there is a left turn for Hutton-le-Hole and Lastingham. Do not, however, take this road, but take the next turn to the left, and again the first left, and straight on through the village of Appleton-le-Moor. On leaving this place take the first right turn, and at a small bridge by a farm house again turn right and then left at the signpost. This road leads straight to Rosedale.

Touring Topics.—

The ordinary tourist should return by the same road, but those who are not afraid of a little rough riding should proceed through Rosedale to Castleton, take the first turn to the right at the signpost to the latter place, go up a long and stiff hill with two gates, and bearing left until the road divides, where a right turn brings the old stone cross called Ralph Cross into view. Just after this cross either road may be taken, the one straight forward to Castleton or the one to the left for the same place *viâ* Westdale. This left turn takes one down a hill with bad surface and steep gradient; I have yet to hear of any motor climbing this ascent. Nearly at the bottom of the village a right turn should be taken, and Castleton is soon reached. From here a good road can be obtained to Guisborough, or should one wish, the seaside town of Whitby is only sixteen miles away, and can be reached by running through Glaisdale and Egton. This makes a pleasant variation, as it is always more interesting to return by a different route from that taken on the outward journey. H.W.F.

Dover to Calais by Motor Cycle.

A PEEP INTO THE FUTURE.

THE possibility of motor cycle trips on the Continent unattended by any of the complications now involved in getting one's machine across is foreshadowed by a recent article in a leading daily newspaper. Since the recent revival of the oft-suggested Channel Tunnel scheme its possibilities as a road, as distinct from a railway, have claimed some attention. It is felt by leading authorities in the motor world that in view of all that has happened in connection with motor vehicles during the past few years the mere provision of a railway connection under the sea between France and England would only partly fulfil the actual purpose for which its construction is intended. In this country, road transit, whether of passengers or goods, is now a necessary and increasingly important complement of the railway. Therefore no scheme of improving communications with the Continent by means of a tunnel beneath the Straits can be considered complete unless provision be made for road traffic as well as the railway.

The Possibilities of a Road Tunnel.

It is believed that the practical and financial questions incidental to a road tunnel are less difficult than in the case of the more familiar railway proposal. There is no doubt that it would be used by a great volume of traffic, of which present figures of merchandise and passengers afford only a slight indication. The facilities that it would offer would attract to the North of France visitors of all kinds who would otherwise never have gone there. Excursions from the Kentish seaside places to the nearer French coast and hinterland would become an everyday feature; motor cyclists in their thousands would go to swell the great stream of traffic, for would it not give to their hobby an altogether new and wonderful range of possibility? To all intents and purposes it would bring Nearer Europe within the scope of a week-end tour, with no more material complications than now go with a run from London to York. Of course, a toll would have to be paid for the use of the tunnel, but it would not need to be large. On the basis of quite a moderate levy per vehicle a Channel Road Tunnel could be made self-supporting, repaying the outlay and meeting its expenses.

At the present time, it is true, the scheme can only be considered as an idea, but as such it has for some time existed as an under-current, coming only recently to the surface. This now achieved, one may be sure that the subject will not be dropped. The time may come, sooner than would generally be anticipated, when the "road" from Dover to Calais is an accomplished fact.

THE MOTOR CYCLE IN RHODESIA.

The first motor bicycle—a lightweight Singer—in the Ndola District of Rhodesia. This machine is used by the district doctor, who has never ridden a motor cycle previously.

Camberley M.C.C.

A meeting was held on the 2nd inst. at Camberley. It was well attended, and the proposal to form a club of the above name was well received. It is hoped to arrange an inaugural run on the 14th inst., and all those interested in the club's development should get in touch with the hon. sec., Mr. A. Ninnis, Victoria Hotel, Camberley.

Cumberland County M.C.C.

A hill-climb will be held on Warnell Fell, Welton, Carlisle, on Saturday, September 13th, instead of the speed trials previously announced, commencing 2.30. The usual classes will be held, and several special prizes are offered. Members of the Westmorland M.C.C. are eligible. Entries must be sent to Mr. H. A. Rhodes, Barrock Park, Carlisle.

Hunslet M.C.C.

The results of the reliability run to Stamford and back for the Greenwood Cup are as follow :

1, H. P Hodge (6 Enfield) ; 2, F. W. Mell (3½ Bradbury) ; 3, W. Wood (3½ Premier) ; 4, F. Langhorn (6 Martin) ; 5, C. F. Clark (4¼ Calthorpe) ; 6, J. C. Broughton (3½ Bradbury) ; 7, C. L. Benn (6 Enfield) ; 8, J. Mawson (6 Rex) ; and 9, C. E. Arundel (6 Rex).

Motor Cycling Club.

A paperchase was run off, starting and finishing at the Red Lion, Digswell, Great North Road, on the 6th inst. A very intricate course of about twenty-seven miles was laid through the Hertfordshire lanes by H. Karslake (3½ Rover sc.) and D. Rothwell (3½ Rover). The "hares" started ten minutes before the "hounds" and finished fourteen and a half minutes in front of them. The best times were :

Solo Class.—1, G. T. Gray (3½ Rudge), 1h. 34½m. ; 2, A. J. Dixon (3½ Singer), 1h. 52m. ; 3, H. F. Edwards (6 Enfield), 2h.

Passenger Class.—1, B. Alan Hill (7 Indian sc.), 1h. 38m.

Of the others to finish not one had followed the whole course.

Middlesex M.C.C.

A speed trial over a course of about fourteen miles was run off on September 7th, and of an entry of twelve the following were the best performances :

	Position on Time.	Position on Handicap.
T. A. S. Brown (3½ T.T. Triumph) ...	1	1
H. E. Parker (3½ Rudge-Multi) ...	2	3
P. Dangerfield (2¾ Douglas)	4	2
G. T. Gray (5 Rudge-Multi)	3	6
M. G. Abraham (2¾ Douglas)	5	4
S. A. McCarthy (2¾ Douglas)	6	5

Brown's Triumph was in remarkably fine form, averaging just over 57 m.p.h. from a standing start and including a turn at the half distance.

Wolverhampton M.C.C.

Nearly twenty competitors took part in the Corke Cup reliability trial last week. The route was *via* Bridgnorth, Chelmarsh, Highley, Farlow Bank, Bridgnorth, and Shipley. This circuit was covered twice. Distance, 95 miles. Results :

	Total error. m. s.
1. Harry Stevens (6 A.J.S. sc.)	28 51
2. C. F. G. Boyes (2¾ A.J.S.)	35 27
3. A. E. Hartill (3½ Calthorpe)	46 17

*Winner of Corke Cup.

Passenger class

1. L Inscoe (A.J.S. sc.)	47 2⅖

First private owner other than winners :

S. F. Morrell (8 Bat sc.)	61 0⅖

Sutton Coldfield and Mid-Warwickshire A.C.

In connection with the club's open reliability trial on October 4th a special team prize, or prizes, have been offered by Messrs. Collier and Sons, Ltd., for teams composed of any three riders irrespective of type of machines.

Calgary M.C.C. (Canada).

A race meeting was held at Victoria Park on the 16th ult., when two track records were broken by Bain. Results :

Five miles, novices, under 560 c.c.—Walker (Bradbury), 7m. 14⅖s.

Five miles, novices, under 1,000 c.c.—Burns (Indian), 7m. 15s.

Five miles championship of Alberta, single-cylinder.—Walker (Bradbury), 7m. 12s.

Five miles amateur open.—Munroe (Excelsior), 6m. 26⅖s.

Ten miles championship of Alberta, amateur open.—1, Bain (Indian), 12m. 34s. ; 2, Munroe (Excelsior).

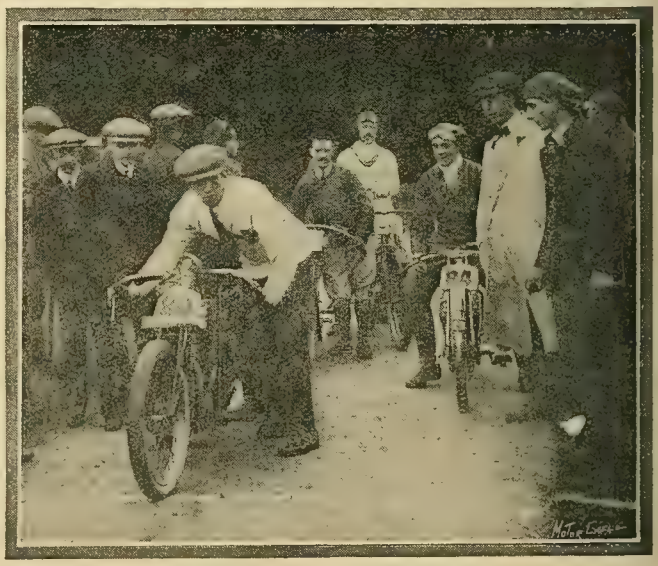
Finsbury Park C.C. (Motor Cycle Section).

A speed-judging competition was held on Saturday, the 6th inst., over a course totalling fifteen miles in length. The distance between each check was two and a half miles, schedule speed 18 m.p.h. The use of watches and speed indicators was prohibited. Results :

1. J. Evans (5-6 Bat) ... ... 94 marks
2. R. Gordon Barrett (3½ Motosacoche) 91 ,,
3. C. F. Revelle (3½ B.S.A.) ... ... 75 ,,

This was the final competition for the Touche Challenge Cup and gold medal, which are presented this year to the member scoring the best aggregate in the three events. In order to obtain results for the speed-judging competition commensurate with the figures of merit in the fast and slow hill-climbs (which were reported in the issue of August 14th) the number of marks was divided by 320, giving results : J. Evans .293, R. G. Barrett .284, and C. F. Revelle .234. Adding these figures to those of the hill-climbs, the results are :

1. R. Gordon Barrett (3½ Motosacoche) ... .679
2. J. Evans (5-6 Bat) ... ... .579



SPEED TRIALS AT GAINSBOROUGH.

B. Rhodes (8 h.p. Zenith), J. R. Sylvester (2¾ h.p. New Hudson), G. Brough (8 h.p. Brough), and N. O. Soresby (3½ h.p. Rudge) waiting to start in Class III.

Club News.—

Hampshire M.C.U.

A half-day non-stop reliability trial was held on the 27th ult. The course was *vid* Fordingbridge, Cranbourne, South Damerham, Combe Bisset, Shaftesbury, and Ringwood, starting and finishing at Cadnam; approximately eighty miles. The following gained first awards: C. Bennett (3½ Rover sc.), J. V. Druitt (6 Enfield sc.), R. C. Pearson (3½ Premier sc.), and M. W. Holland (4 L.M.C. sc.)

Southampton and District M.C.

The above club held a hill-climbing contest at East Meon, near Petersfield, on the 3rd inst., in connection with the Hampshire M.C.U. The condition of the hill was excellent, and some good times were made. The results are:

Class I. (lightweights).—1, F. Thompson (2¾ Douglas); 2. C. Jeffries (2¾ Humber).

Class II. (up to 600 c.c.).—D. Ash (3½ Triumph), fastest time of the day.

Class III. (any touring motor cycle, on time).—R. C. Pearson (3½ Premier). This rider also secured first place in the sidecar class for similar machines.

Class V. (passenger machines and cycle cars).—W. Fleetwood (6 h.p. A.J.S. sc.)

Colchester and District M.C.C.

The inter-club hill-climb held on the 30th ult. at Fiddler's Hill, Fordham, *v.* Ipswich and District M.C.C., resulted in an easy win for Colchester by 11 points to 1. Details:

Touring Class up to 500 c.c.

1.	E. Herdman (3½ Rudge-Multi) ...	23⅗s.	(C.)
2.	A. Medcalf (3½ B.S.A.) ...	29s.	(C.)
3.	H. Berry (3½ Triumph) ...	29⅕s.	(C.)
	F. E. N. Crosby (3½ Swift) ...	29⅗s.	(C.)

Any Machine up to 500 c.c.

1.	E. Herdman (3½ T.T. Rudge) ...	22s.	(C.)
2.	W. E. Scott (3½ Triumph)	24s.	(C.)
3.	S. T. Wilkin (3½ T.T. Rudge) ...	24⅕s.	(C.)
	D. W. Poppelwell (3½ T.T. Singer)	24⅕s.	(I.)

On the tie being re-run, S. T. Wilkin's time was ⅗s. slower.

Purley and District M.C.C.

The night trial for the Murray-Scott Cup and other prizes is postponed to September 27th, to avoid clashing with the Streatham speed trials at Brighton.

Surrey M.C.C.

The results of the hill-climb held on Saturday last are as follow:

Class 1.—Touring machines up to 350 c.c.

		Time.	Fig. of merit.
1.	C. A. Crow (2½ Singer) ...	39s.	... 464
2.	S. H. Crow (2½ Zenith) ...	42⅘s.	... 359
3.	T. G. Meeten (2 Levis) ...	44⅘s.	... 290

Class 2.—Touring machines up to 550 c.c.

1.	T. G. Meeten (3½ Rudge) ...	27⅕s.	... 495
2.	P. Mitchell (3½ Premier) ...	34⅕s.	... 377
3.	A. Chalcraft (3½ Rudge) ...	31⅕s.	... 372

Class 4.—Any machine, on formula.

1.	T. G. Meeten (3½ Rudge) ...	26⅘s.	... 508
2.	C. A. Crow (2½ Singer) ...	37⅕s.	... 499
3.	F. W. Barnes (6 Zenith) ...	25s.	... 408

Class 5.—Sidecars.

1.	T. G. Meeten (3½ Rudge) ...	36⅗s.	... 465
2.	F. W. Barnes (6 Zenith) ...	29⅗s.	... 462
3.	P. Mitchell (3½ Premier) ...	51⅘s.	... 324

Class 6.—Any machine, on time.

		Time.
1.	F. W. Barnes (6 Zenith)	23⅕s.
2.	T. G. Meeten (3½ Rudge)	27⅕s.
3.	A. Chalcraft (3½ Rudge)	29⅖s.

Class 7.—Any touring machine, standing start and re-start on hill.

		Time.	Fig. of merit.

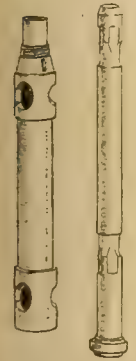
The Toroga Two-speed Gear.

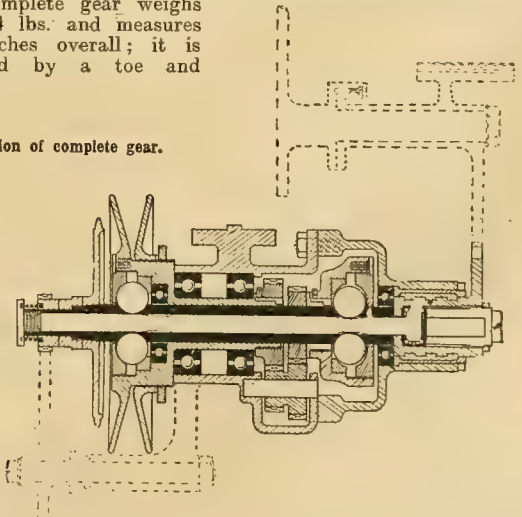
THE object of the designers of this gear was to produce a simple and efficient two-speed gear which could be easily attached to almost any make of motor cycle. In this they have fully succeeded, and further have evolved a gear which, on account of its simplicity, can be sold at a comparatively low figure. The gear is of the counter-shaft type and is designed for chain and belt drive.



Internal spindle and sleeve of Toroga gear.

The most unusual feature of the device is the type of clutch employed, which is of the ball and cone type, somewhat similar to that used in machine tool practice. Two of these clutches are employed, and they each consist of three large steel balls which may be forced out against cones by the action of inclined planes on an internal wedge bar. The main shaft runs on Hoffmann type ball bearings, and below it is mounted a small counter-shaft, which, in combination with the gears on the main shaft, provides the low ratio. Reference to the line drawings published herewith will make the action of the gear quite easily comprehensible. A 45° reduction is employed and all parts are enclosed in an oiltight and dustproof casing, which, by means of an adapter plate, may be fixed to nearly any type of bottom bracket. The clutches may be adjusted for wear by a simple screw adjustment, and a kick-starter of the pinion and quadrant type is fitted to the left side.

After a thorough examination of one of the early gears which had run for a considerable distance, we were given a demonstration on the road and finally took charge of the machine ourselves. The clutches are beautifully smooth in action and grip firmly when sent right home. The machine was fitted with a 2½ Toroga engine, and we found it quite a simple matter to start from a standstill on an up slope, even on the top gear of 6 to 1, and on the low gear we saw two persons, scaling about 24 stone, started uphill with ease. The complete gear weighs only 14 lbs. and measures 10⅝ inches overall; it is operated by a toe and heel pedal and the price will be £6 10s. only. The makers, the Toroga Motor Engine Co., Ltd., St. George's Terrace, Brearley Street, Birmingham, are also manufacturing a neat and solidly constructed 2½ h.p. engine. In future this engine will be rated at 2¾ h.p., and will have a bore and stroke of 70 × 90. The valves are placed side by side and have adjustable tappets, and the magneto lies behind the cylinder.



Section of complete gear.

The First Ascent of Skiddaw on a Motor Cycle.

By GEORGE D. ABRAHAM, author of "Motor Ways in Lakeland," "The Complete Mountaineer," etc.

SOME time ago thoughts of the lines of an old Cumbrian rhyme

"Auld wives and bairns on jackasses
To tippy twop may ride"

suggested the idea that Skiddaw, our most famous English mountain, might be climbed by motor cycle. But the suggestion met with scant encouragement from the experts. The lofty peak whose "red glare . . . roused the burghers of Carlisle" in long-past Armada days was a familiar sight during the Six Days Trials, but none stayed behind to essay its conquest. With its 3,054 feet of height and tremendous and continuously pathless gradients, Skiddaw may well be called the limit in hill-climbing; in fact, really "the worst hill in England."

However, news came that two local enthusiasts, T. Blair Westmorland and Raymond Drinkall had made two plucky but unsuccessful attempts, and thus plans, which had often been discussed with W. B. Little, of the Cumberland County M.C.C., were brought to fruition. The famous motor cyclist mountaineer had never even walked up the mountain. The writer's party, after passing through Applethwaite, travelled up into the heights as far as possible on four wheels. The wall-jumping motor car is not yet, thus we finally walked up to the "half-way hut." The great mountain was a mass of common glory; no pen or picture can do justice to the wondrous colouring of the sun-flecked heather or the marvellous outlook over mountains of a thousand forms with the lake of Derwentwater enfolded in their purple hollows.

W. B. Little (3½ h.p. Premier, Armstrong gear), the first motor cyclist to reach the top of Skiddaw. This photograph was taken at the highest point, 3,054 feet above sea level.

Attacking the Gradient.

There was just time to gather bunches of wild white heather for luck to the rider ere, from far underneath us, came the sound of his throbbing engine. Then, a thousand feet below, a tiny dark speck sped over the green breast of the lower slope and seemed to fling itself at the first steep gradient. For a few minutes man and machine were out of sight hidden by the underlying bulge of the mountain. This section we knew was to prove the test of the climb. There was a height of 1,750 feet to be climbed in less than a mile, practically an average gradient of 1 in 3 for that distance. Steep steps of almost 1 in 2 had to be negotiated. No plain pathway was available, for most pedestrians choose their own way up the wide front of the slope, and patches of heather hid the loose rocks. Still the daring climber came up towards us without a falter, and the little crowd assembled on Skiddaw assisted him by an outburst of encouraging cheers at the little hut, which is the half-way landmark from Keswick.

The final climb to the top of Skiddaw. Note the stony nature of the surface.

Buck-jumping on a Motor Cycle

Then came the real test. About five hundred yards above the hut, the numerous tracks led most steeply up to the left amidst deep ruts and stony channels. In mid-air most of the time and seldom in the saddle, the rider's position now seemed desperate. The machine bounded and jumped like a bucking horse. At times the front wheel lifted so much that a backward somersault seemed scarcely preventable. Then suddenly all hopes of a non-stop climb were dashed to the ground and the rider with them. The front wheel swung round on the rocky slope—rider and machine skidded bodily into the heather—a bad skid indeed. It was an exciting moment. A certain too adjacent spectator was so moved literally as to aver that the meaning of the word "Skiddaw" was at last explained.

The First Ascent of Skiddaw on a Motor Cycle.—

However, no damage resulted, and Little was soon wriggling his way sinuously and bumpily up to the easier crest of Jenkin Hill, which really marked the end of the most difficult portion. The summit was now in sight, and far northwards stretched that familiar prospect away over towards Carlisle and the Scottish Lowlands. The well-known gate through the iron railings was found to be securely fastened with thick iron bands. Fortunately, a strong file was carried, and willing hands soon opened the way summit-wards. A slight use of the second gear was here possible, and after the passage of the second gate all vegetation was left behind. The rocky wilderness was now climbed and traversed over the lower peaks to the highest point. A cold nor'-easter swept over the summit, and there was just time to note the gleam on the sea, 3,054 feet below, before the descent was begun. Thanks to the splendid brakes this was achieved successfully and safely. Possibly my readers may think that the descent was easy in comparison with the ascent, but if anything it was the more difficult of the two; it requires considerable nerve to sit on a bounding motor bicycle when descending a mountain side.

The Victorious Machine.

A word of tribute must be paid to the machine which stood the test of this remarkable climb. This was the 3½ Premier which Little rode in the Six Days Trials, the same Stelastic tyres being still in place and giving a splendid grip on the steep, shaly slopes. Without a first-class three-speed gear the ascent would surely be impossible. The Armstrong gear came out of the ordeal with flying colours.

For the information of those who will assuredly attempt to repeat the climb, it may be interesting to note that the six miles between Keswick and the summit were covered in one minute over an hour. Of this time quite ten minutes were lost unfastening the two upper gateways. The heather season is not the best time for an ascent; during a dry springtime a better route could undoubtedly be found.

Descending the slippery heather-covered slope of Skiddaw after the climb
The vale of Derwentwater is seen far below.

LUBRICATION: A FOOTNOTE.

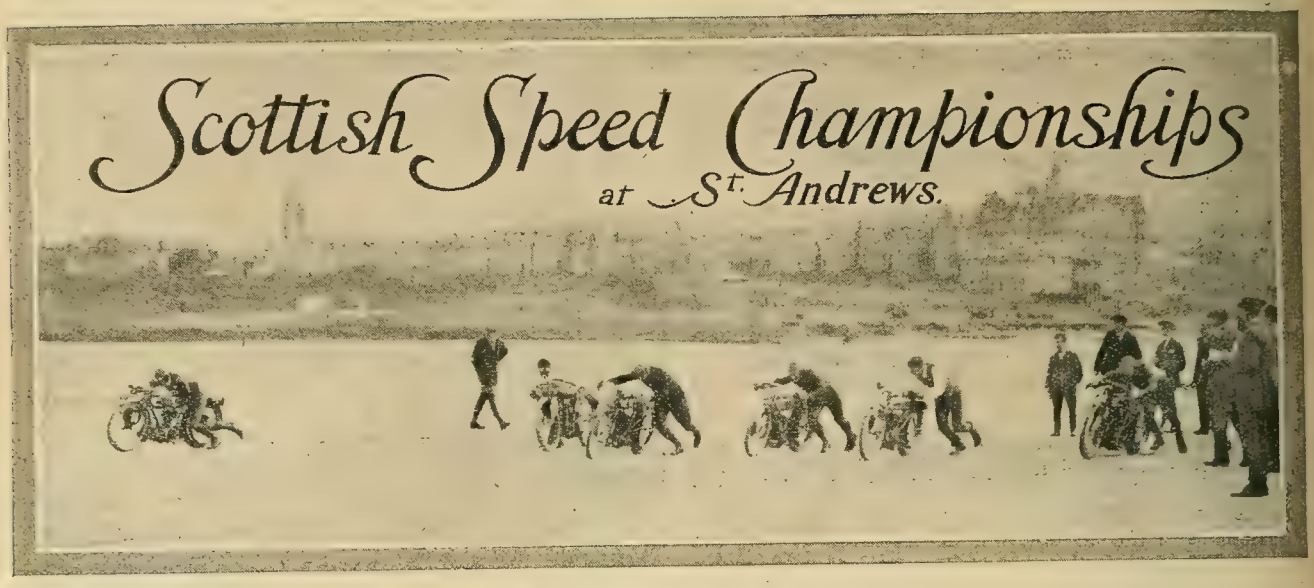
DURING the last year or two a great amount of attention has been directed to the subject of lubrication; not, perhaps, before time. We are now considerably more advanced on the subject than we were, say, two years ago, but one point, which appears to the writer to be a most important one, does not seem to have received as much consideration as it deserves. The point I refer to is this—that under all existing automatic systems the lubricant is fed to the engine in proportion to the speed of the latter, and not, as it should be, in proportion to its load. To explain fully: Take the case of an engine in which the oil is delivered to the crank case by some form of mechanical pump driven by the engine. When descending a decline at a good speed with the engine running free very little lubricant is required indeed; yet because the speed is high the pump is giving a large supply. Conversely, imagine the same machine to be ascending a long, steep hill. Now we all know that when the speed begins to fall off an extra dose of oil will be of the greatest assistance to the labouring engine, but with the present systems of forced feed that is just what it does not get. In fact, the supply is actually diminished in direct proportion to the decrease in speed, and it is only reasonable to suppose that such a machine will often quite needlessly fail on hills where an old machine whose rider happens to know when to use his hand pump will sail up without any great difficulty. The same case, of course, applies to machines fitted with the vacuum feed system.

I shall, of course, be told that in such cases it is up to the rider to increase the oil supply either by pumping in an extra charge by hand, or by re-adjusting his feed regulator. While it is perfectly true that he can obtain the results desired by such means, it is also painfully obvious that the system rendering them necessary cannot truthfully be described as automatic. No, if motor cycles are to be ridden by everybody ("everybody" including the hopelessly unmechanical and muddle-minded), then motor cycle lubrication must be utterly and entirely automatic; not automatic with manual assistance. And I might add here that there should be some more than easy means of judging whether the automatic oiler is really delivering its goods other than by listening for cries of agony from the engine, else trouble is likely to ensue. More than one manufacturer please note

At present, therefore, the matter stands thus. We have already several machines in which the oil is forced into the crank case, and at least one in which it is forced directly to all the bearings; in each case, however, the supply of lubricant is regulated by the speed at which the engine is running, and not by the actual work it is doing. A semi-automatic hand pump, the feed of which was determined by the throttle opening, was shown at Olympia last November by Messrs. Best and Lloyd, but, unfortunately, it does not appear to have attracted anything like the attention it undoubtedly deserved.

RED WHEELS.

Scottish Speed Championships at St. Andrews.



The start of the medium weight event.

MAGNIFICENT weather favoured the speed contests under the auspices of the Scottish A.C.U. on the West Sands at St. Andrews on Saturday last. The Union officials had left nothing to chance, all the arrangements being very well organised, and it only required a fine day to make the event memorable as far as Scottish motor cyclists were concerned. Being the first meeting of an international character some very fine performances were anticipated, and those present were not in any way disappointed. From two to three thousand spectators lined the course, which was one mile in length, the sandy surface being in very fine condition. A very slight breeze blowing from end to end of the course somewhat tempered the heat of the sun, which shone with great brilliance throughout the day. The famous golfing town was *en fête*, and the varied dresses of a large number of ladies who graced the event with their presence lent a touch of colour which was decidedly pleasing. Several of the local councillors were officials of the meeting, and this, no doubt, helped towards the success of the afternoon.

A Late Start.

For a first attempt at running an event of this nature on such a large scale, the S.A.C.U. deserve to be congratulated, and the one or two little failings which were apparent on Saturday will, in all probability, be remedied at the next meeting. Chief among these was the delay in running off the preliminary trials, which, although advertised to start at 11 a.m., did not do so until midday, this delay necessitating the abandonment of the luncheon interval. This may, however, have been a blessing in disguise, since the spectators were thus enabled to see all the racing at the one time, without the monotony of waiting while the officials refreshed themselves.

The following were the eight classes run off: Class 1, Scottish lightweight speed championship for motor bicycles having engines not exceeding 350 c.c.; distance, twenty miles. Class 2, Scottish medium-weight speed championship for machines having engines exceeding 350 c.c. and not exceeding 560 c.c.; distance, twenty miles. Class 3, Scottish heavyweight speed championship for machines having engines exceeding 560 c.c. and not exceeding 1,000 c.c.; distance, twenty miles.

The Passenger Classes.

Class 4, one mile sidecar race, engines not exceeding 560 c.c. Class 5, one mile sidecar race, engines exceeding 560 c.c. and not exceeding 1,000 c.c. Class 6, one mile cycle car race, engines not exceeding 1,100 c.c. Class 7, three lap race for machines having engines exceeding 350 c.c. and not exceeding 560 c.c.; experts barred. Class 9, three lap race for machines having engines exceeding 560 c.c. and not exceeding 1,000 c.c.; experts barred.

S. Crawley (3½ h.p. Triumph), winner of the medium weight championship.

Class 1.

There were one or two non-starters in Class 1, and those who survived the preliminary trial were Hugh Mason (2¾ N.U.T.), J. Steel (2¾ Douglas), D. S. Alexander (2¾ Enfield), A. H. Alexander (2¾ Douglas), J. Roy (2¾ Douglas), J. R. Alexander (2¾ Douglas), W. K. Gulland (2¾ Douglas), and O. G. Braid (2¾ Martin).

The riders were started at minute intervals, which, from a spectator's point of view, was disappointing. It was easily seen that Mason and Steel would, bar accidents, qualify for the final, as their respective mounts appeared a great deal faster than any of the others.

The next event was the preliminary heat for the medium weight championship. A. J. C. Lindsay (3½ Rover) won this, but had S. Crawley (3½ Triumph) not stopped owing to his oil plunger sticking, he would have secured first place. Even as it was, he was only seven seconds slower than the Rover expert, and looked to have an excellent chance of the championship. The following riders, in addition to those named, qualified: E. W. Cheshire (3½ Triumph), J. L. Rankin (3½ Singer), J. G. Beveridge (3½ Rudge), K. J. P. Laing, Hawick (3½ Triumph), A. H. Alexander (3½ Indian), and J. Darlock (3½ Rudge).

A Fine Race.

The championship in Class 1 was now run off, and resulted in a very fine tussle between Hugh Mason (2¾ N.U.T.) and J. Steel (2¾ Douglas). Although Mason had the faster machine of the two, the Edinburgh rider was the better on the corners, and managed to hold his own for a few laps. Leaving nothing to chance, however, the Newcastle exponent took no risks and gradually drawing away from his opponent on the straight, won a fine race in 25m. 42⅕s., being about 500 yards ahead of Steel, who finished second. The leader lapped one or two of the other competitors at the end of ten miles, and was never passed during

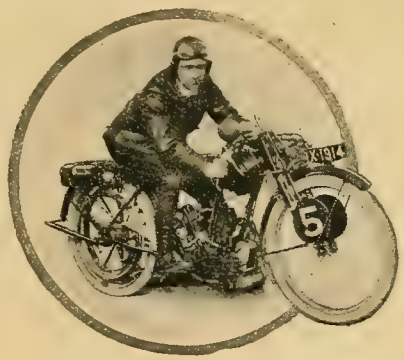
R. J. Braid (8 h.p. Martin-Jap) travelling well. Braid eventually won the heavy weight championship.

the race. His win was a most popular one, and he was accorded a great ovation on finishing. Mason's machine, unlike those ridden by the majority of the competitors, was fully equipped, even to having a belt guard somewhat on the lines of that standardised on the Bradbury. The officials had rather peculiar notions with regard to equipment, as although they allowed competitors to ride their machines without mudguards and in some cases stands, they made them all carry horns. Rather a funny idea, to our mind.

A Narrow Escape.

The next race on the programme was the championship for the medium weights. Crawley and Lindsay were the fancied men for this event, and right from the start it was seen that unless something unforeseen happened the race lay between the two. Both were leading at the end of the first mile, but at this point they nearly came to grief, a collision being narrowly averted. For the first few miles the duel was a ding-dong one, but, as before stated, Crawley was on the faster machine, and gradually leaving the Rover rider, won by close on a mile in 24m. 35⅖s., Lindsay being second in 26m. 6s. The latter might have been nearer the winner, but on seeing that he could not beat the Triumph crack, he took matters easily, and made certain of second place. The finest race of the afternoon was that for third place between J. G. Beveridge (3½ Rudge) and E. W. Cheshire (3½ (Triumph). First one would lead and then the other, only a matter of twenty yards separating them at the most. On the last lap, however, Cheshire got away, and led his opponent over the line by about thirty yards. The spectators showed their appreciation of the sporting zest of the competitors by giving both riders a great cheer. It was rather unfortunate that A. H. Alexander was unable to use the new 3½ h.p. Douglas in this event, as the first appearance in competition of the new Bristol product would have been worth noting. Scottish riders may, however, have an opportunity of seeing the new machine at the remaining few open events.

The heavyweight event was a little disappointing, only four entrants starting. A. H. Alexander was again unlucky, as he was unable to ride his 8 h.p. Matchless, having damaged it in practice, one



Hugh Mason (2¾ h.p. N.U.T.), winner of the lightweight championship of Scotland.

of the cylinders having a hole blown in it. Contrary to general expectations, R. J. Braid (8 h.p. Martin-Jap) won, riding a fine race, and beating J. R. Alexander (7 Indian) by fully half a mile.

The other events resulted in runaway victories with the exception of the 1,000 c.c. sidecar class, which F. J. Hutchison (7 Indian) won by a narrow margin.

Other results were as follow:

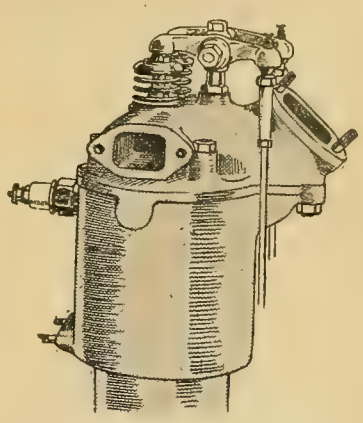
Class 8.—1, J. G. Beveridge (3½ Rudge); 2, J. Nicoll (3½ Rudge); 3, K. J. P. Laing (3½ Triumph).

Class 9.—1, A. J. Carlow (6 Zenith); 2, P. Galbraith (7 Indian); 3, A. F. Downie (6 A.J.S.)

Class 4.—A. J. C. Lindsay (3½ Rover sc.); 2, T. Stevenson (3¾ Scott sc.); 3, J. Christie (3½ Kerry-Abingdon sc.)

The result of the mile cycle car race for engines not exceeding 1,100 c.c., was as follows:

1, H. Alexander (10 Calthorpe); 2, P. G. Pye (7 Swift). Time, 1m. 24⅖s.



Cylinder and valve gear of the Buckingham water-cooled cycle car engine, which was described last week (see page 1167).

INTERNATIONAL SPEED TRIALS AT BRIGHTON.

The open international speed trials which are being held on Madeira Drive, Brighton, on September 20th, by the Streatham and District M.C.C., promise to be very interesting. Efforts have been made to attract foreign entries, and now that the Continent is experiencing something like a boom in the pastime it is to be hoped that some of the best men will come over. The programme is a long one, and a start is to be made at one o'clock. No less than twenty classes are down for decision. These will be sub-divided into classes for experts and non-experts, and it is also interesting to note that there is a special class for three-wheeled cycle cars.

Hugh Mason leading the field at one of the turning points

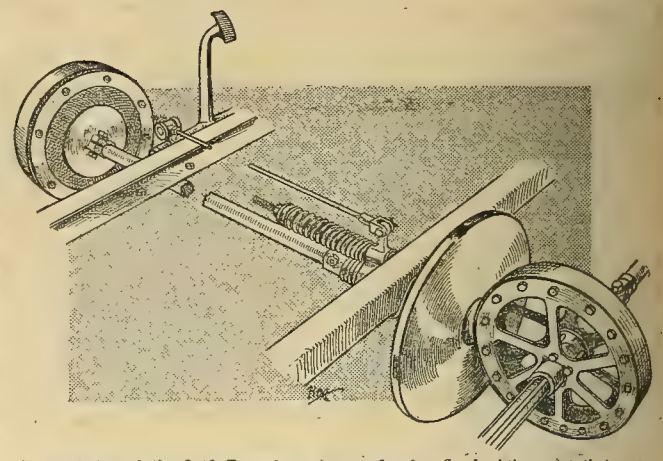
THE TWEENIE CYCLE CAR.

THE Tweenie two-cylinder cycle car is sold in this country by Messrs. Jozot and Co., the French House, 59-61, New Oxford Street, W.C. The 8-10 h.p. Tweenie is quite an interesting little vehicle. Its motive power is a two-cylinder V type water-cooled engine, 72 × 120 mm., with the cylinders set at an angle of 30°. The magneto, which is a new one to readers of *The Motor Cycle*, is a large size gear-driven Rugère. As this magneto runs at half engine speed, it is purposely of a larger size than usual, so as to give a fat spark for easy starting. The carburetter is the well-known Solex, which gives great flexibility and ample power. The cooling is arranged on the thermo-syphon system, and an ample supply of water is carried.

The chief interest in the vehicle, however, lies in the drive. In the first place, it may be mentioned that the engine has internal flywheels in addition to an external flywheel, incorporated with which is a universal joint, shown in the accompanying sketch. This universal joint is of the most simple and effective type, consisting of two portions jointed together by a sheet of thick rubbered canvas or leather. Thence the drive is taken through a propeller-shaft to a friction disc, kept in tension against the disc by means of a powerful spring, and supplied with the usual ball thrusts. Ball bearings are, in fact, found everywhere in the vehicle except in the engine. The friction wheel is shod with compressed paper, and is of much greater width than usual.

The final drive from the cross-shaft to the rear wheels is by a single chain, while the rear axle is solid, as there is no differential. The chassis is of channel steel, while the springing is particularly interesting, the front spring being of the transverse laminated pattern, each extremity of which is attached to rods sliding in guides supporting the stub axles. The rear springing is on Lanchester lines, each spring having a shackle at the forward end, being held solid in the centre. Adjustable radius rods are provided.

The brakes consist of an external foot-controlled band brake on the cross-shaft and two internal expanding hand-operated brakes in the rear wheels. The control is absolutely standard, and similar to that used in car practice. The whole of the mechanism from stem to stern is particularly accessible, while there is ample locker room. The petrol tank holds about three gallons. The steering is by rack and pinion, while it is interesting to note that the steering wheel is of large dimensions. 650 × 65 mm. tyres are fitted.

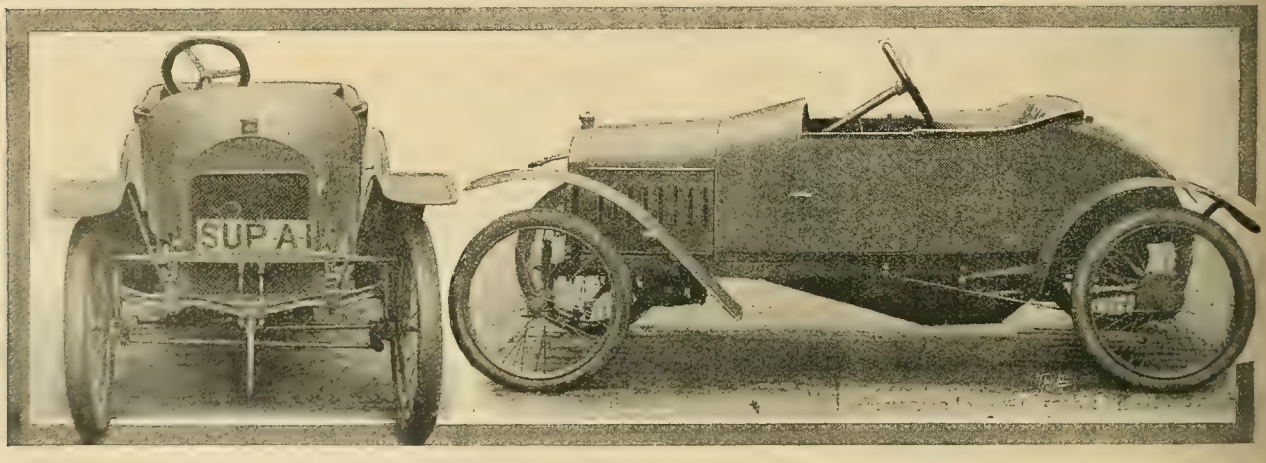


Transmission of the 8-10 Tweenie cycle car showing flywheel incorporating the universal joint. Note the width of the friction wheel tread.

BRITISH IMPORTS AND EXPORTS OF MOTOR CYCLES.

The value of imports of motor cycles for the month of August, 1913, was £19,284, or a great increase over the amount for the corresponding period of 1912, which was £14,568. For the eight months ended August 31st, 1913, the value of imports was £184,930 against £114,989 in 1912, thus showing the growing trade in motor cycles

The value of the exports for the month of August, 1913, was £67,714—a slight decrease from the amount for the corresponding month of 1912. For the eight months, however, the amount for 1913 was £651,424, or an increase of £250,082 over the eight months of 1912. As will be seen, both the imports and exports are steadily increasing, for in 1911 the import figure for the first eight months reached only £79,651, and the export figure £181,418.



The twin-cylinder 8-10 h.p. Tweenie cycle car. Note the specially-designed front springing.

Dry Cleaning Brush.

Motor cyclists occasionally soil their clothes either by oil flung from the engine, chains, or belt, or whilst cleaning their machines. To enable soiled clothing to be readily cleaned, Messrs. H. Taylor and Co., 21a, Store Street, Tottenham Court Road, W., have lately

The "Mutax" dry cleaning brush sold by Taylor and Co.

introduced a dry cleaning brush, known as the Mutax, which we illustrate. The handle of the brush consists of a small reservoir for petrol, or a patent non-inflammable spirit, known as Westrosol, can be inserted. The filler cap is provided with a push-button valve, which, when open, allows the petrol to flow through the bristles of the brush.

A Cycle Car Trunk.

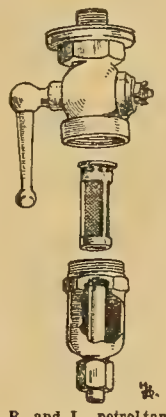
A capacious and well-made trunk for attachment to cycle cars has been produced by J. B. Brooks and Co., Great Charles Street, Birmingham. A tray fits into the upper part of the trunk for the purpose of carrying light articles.

Brooks's Cycle Car Trunk.

and snap-down catches secure the lid, a stout lock being supplied for additional security. Strong spring holders secure the trunk, which is made of best materials, to the luggage carrier.

The B. and L. Combined Petrol Tap and Filter.

The combined petrol filter and tap which we illustrate is the product of Messrs. Best and Lloyd, Ltd., Cambray Works, Handsworth, Birmingham. It will be noted that the petrol can be shut off by means of the tap, which is above the filter. This enables the well and gauze to be rapidly cleaned. The construction of the well, with raised nipple in the centre, is worthy of comment. This acts as a trap for dirt or water, which collects round the bottom of the well, the lighter spirit finding its way through to the carburetter, and leaving any undesirable matter behind. This article, like all B. and L. fittings, is well constructed, the tap being provided with a spring-controlled lock which automatically holds it in the "On" or "Off" positions. An advantage of this form of tap is that the handle can be turned to the right or to the left to shut off.



B. and L. petrol tap and filter.

An Exhaust Cap Cooling Device.

Messrs. Brown and Holland, 77, Prince of Wales Road, Kentish Town, N.W., have introduced a water-cooled exhaust

The B. and H. water-cooled valve cap fitted to a 3½ h.p. Triumph engine.

valve cap. The valve cap is a special one with a rod brazed in the centre. Above the cap is fitted a hollow sleeve supplied with a union, and above that is another cap and union. Copper and asbestos washers render the joints watertight, and the whole is secured by a nut and washer. The two unions are coupled to a small gilled tube radiator attached to the side of the tank. It is claimed for the device that it enables an engine to retain greater efficiency, as it keeps cool that portion which assimilates the greatest heat, and saves the valves from pitting. In case of any trouble with the device it can be disconnected and ordinary air-cooling be resorted to. We made a test during which we rode as a passenger in an 8 h.p. Zenith sidecar, which was twice taken up Westhill, Highgate; the engine kept noticeably cooler when the auxiliary water-cooling apparatus was used.

New Dunlop Tyre.

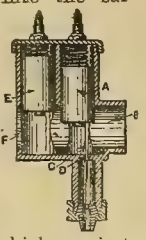
We are enabled to give some details concerning a new type of tyre introduced for the coming season by the Dunlop Tyre Co. We saw the first of these tyres in the Six Days Trials, when it was ridden by one of the firm's testers all round the course. The tread is a combination of the ribbed and rubber-studded patterns, which allows the maximum thickness to be found in the centre of the tread, the point where the greatest wear takes place. It will be noticed that the centre rib is of ample width, and has studs placed in a staggered position along its surface, while midway between the two outer ribs studs

A new pattern Dunlop studded tyre which will be ready in October.

are also situated. The studs give an excellent driving and braking effect, and, being placed alternately, they do not become clogged on greasy surfaces. The side ribs, which are also reinforced by studs, prevent skidding when taking corners. Despite these alterations, the speed and resiliency of the tyre has not been in any way altered, especially as when running fast on the open road only the centre portion of the tyre is in contact with the ground. This form of tyre is made in several strengths, the new studded pattern light tyre, the new studded heavy and extra heavy tyres, and the 650 × 65 mm. pattern for passenger work. All these tyres, which, by the way, have beaded edges, will not be ready for delivery until the end of October.

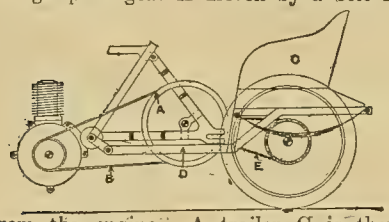
Variable Fuel Supply.

It has often been proposed to employ a taper needle projecting into the carburetter jet orifice for the purpose of varying the effective fuel outlet. In the construction illustrated this system is employed in conjunction with sliding piston throttle and air valves. The throttle piston A controls the passage B leading to the engine, and has attached to its lower end the taper needle C, which projects through the fuel orifice D. The taper of the needle C is so graduated as to supply the correct amount of fuel for any position of the throttle D, and a further adjustment is afforded by the use of a second valve E controlling the air port F.—C. W. Graham, No. 6622, 1912.



A Conversion Idea.

For the purpose of converting a motor bicycle into a tricar, the rear wheel is removed, and in its place is mounted a change-speed gear A driven by a belt B

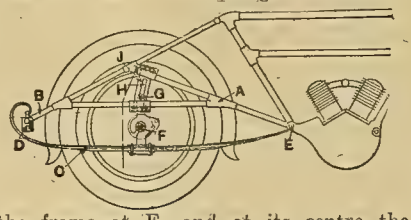


from the engine. A trailer C is then connected to the bicycle frame by stays D, and the trailer axle is driven by chain gearing E from the speed gear A. It would seem that if the machine be used solo and the driver occupy the rear seat a long handle-bar would be required to bring the controls within reach.—C. Krautwurst, No. 26,698, 1912.

PATENTS by Eric W. Walford F.C.I.P.A.

Rear Springing.

The frame A is of special construction, and includes a pair of tubes B running to a point at the rear of the wheel. These tubes support on either side a laminated semi-elliptic spring C, an auxiliary springing device being interposed as shown at D. The front end of each spring C is bolted to



the frame at E, and at its centre the spring has clipped to it a bracket, carrying the wheel spindle F and the necessary abutments for a hand brake. Above the wheel spindle is arranged a roller G, engaging a curved guiding slot H in a plate J, the curvature of the slot being the arc of a circle struck from the point E. —J. E. Spedding, No. 266, 1913.

A Douglas Engine Shock Absorber.

The ordinary type of frictional shock absorber wastes a certain amount of energy, and it has been proposed to employ spring buffers, which transmit the drive resiliently to the toothed ring. The present construction is of the latter type, and comprises an inner part A and an outer toothed ring B. These two parts are formed with lugs C, as shown. A wire ring D is provided, upon which are

threaded the requisite number of coil springs E, and the ring D is inserted into slots formed in the lugs C, with each spring engaging one lug on the inner member and another on the outer member. The arrangement of the springs upon the ring D renders it easy to assemble the device, and also keeps the springs in a central position between the lugs. It will be clear that movement of one member in relation to the other will first compress the springs, after which the power stored will react on the driven part.—W. Douglas, No. 23,313, 1912.

SPARKLETS

Tyre Prices Reduced.

We are informed by the Continental Tyre and Rubber Co. (Great Britain), Ltd., that their new price list of motor cycle tyres will be ready this month, and that considerable reductions in prices for 1914 have been made.

Castrol in Favour.

We understand that riders using Wakefield Castrol in the recent A.C.U. Six Days Trials obtained 21 gold, 8 silver, and 16 bronze medals. This oil, we hear, was also used by the winners of the International Touring Club prize and the club team prize.

Special Fuel for the N.U.T.

In the A.C.U. Six Days Trials the N.U.T. machines, all of which completed the course, were using a special spirit produced by their manufacturers, Sir William Angus Sanderson and Co., Ltd. The riders found the average consumption improved on this spirit.

Rocs in the Pyrenees.

We hear from Messrs. A. W. Wall, Ltd., Birmingham, that a Sheffield client of theirs recently carried out an ambitious tour on his Roc motor cycle through France and over the Pyrenees. *En route* some lofty mountain passes were climbed in the Pyrenees, the highest being Col du Tourmald, 6,961 feet; Col de Puymorens, 6,292 feet; and Col de las Casas, 6,808 feet. Throughout the Roc motor cycle, which was, of course, fitted with the Roc two-speed gear, gave not the slightest trouble.

Hutchinson Tyre Book.

A useful handbook has recently been published by the Hutchinson Company, which is of interest to users of these tyres. Copies can be obtained, post free, from 70, Basinghall Street, E.C.

A Satisfactory Tyre.

Rom tyres did well in the A.C.U. Six Days Trials. Not a very large number of machines were so equipped, but those riders who did use this make had cause to be satisfied. K. A. MacDonald (3½ Singer), A. J. Dixon (3½ Singer), and F. G. Ball (2¾ Douglas) gained gold medals and reported freedom from tyre trouble on Roms.

Variable Gap Sparking Plugs.

Some little time ago "Ixion" gave particulars of a variable gap sparking plug sold by J. H. Runbaken, 7, Peter Street, Manchester. Our contributor's experiences were highly satisfactory, and Messrs. Runbaken inform us that so great was the resulting number of applications for this plug that they were at the time unable to deliver. However, they can now supply purchasers from stock by return.

New Liverpool Garage.

We are informed by Messrs. F. C. Jones and Co., the well-known motor cycle agents of Liverpool, that they have now transferred the whole of their business to a large new garage, which they have erected in Queen Street, Liverpool.

Splitdorf Magnetos.

The Splitdorf magneto, an article produced in the States, has just made its appearance on the English market. We tried one last week on an Excelsior sidecar machine, and it behaved most satisfactorily, giving a good spark at very slow speeds. The "push on" terminals enable the high tension wire to be removed in a trice.

Another Ariel Team Prize.

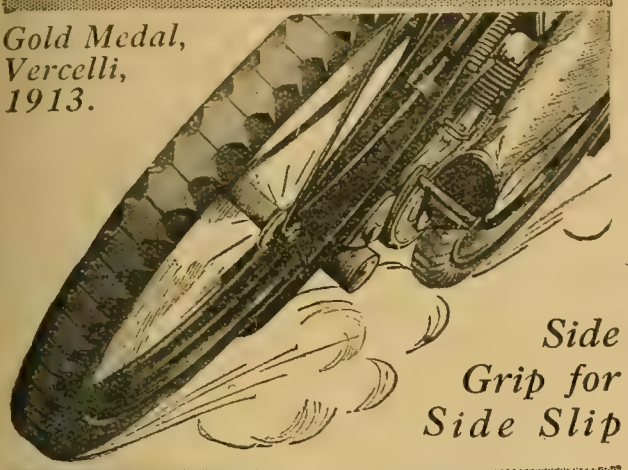
The Ariel team seem to be making a habit of winning team prizes in reliability trials this year, for in addition to the Scottish and English Six Days Trials, they have recently won the team prize in the Newcastle and District Motor Cycle Club's reliability trial. In addition to this the first prize was won by G. W. Raper on a 3½ h.p. Ariel.

A Successful Belt.

The new pattern leather reinforced rubber Lycett belts were extremely successful in the A.C.U. Six Days Trials at Carlisle. Twenty-six of the belt-driven machines obtaining medals were fitted with these belts, which are known as Lycett's Reliable belt. They seemed to stand up admirably to the very strenuous work.

Beldam

Gold Medal, Vercelli, 1913.



Side Grip for Side Slip

THAT last risky skid could not have happened had you been riding on Beldam Motor Cycle Tyres. For the deep "V" tread stops side slip—it grips the road on corners or on grease, and makes riding safe.

Cased Cover Prices:

Size.	Extra 3-ply.	Extra Special 4-ply.
26in. x 2in.	34/-	39/6
26in. x 2¼in.	38/-	45/-
26in. x 2½in.	43/-	50/-

Retreading.

Send us your old tyres of any make for repair and retreading. Beldam Workmanship and Materials. Prompt Delivery. Prices per cover:

Extra Heavy Tread, 13/6
Medium Tread .. 11/6

Patching, Bursts, etc., according to requirements.

The Only Gold Medal

for Motor Tyres—in competition with the principal British and Continental makes—was awarded at Vercelli Exhibition to Beldams.

TERRY'S SPRING LINK absorbs road shocks.

It is a wonderful auxiliary to motor cycle front fork springing—taking up all the shocks uneven road surfaces create and imparting to the motor cycle the comfortable easy gliding motion of the car. Vibration is reduced to a minimum—and, of course, great economy in running costs is effected. It can be fitted to any front fork of link type. For 3 h.p. machines **10/-**, 6 h.p. **12/6** per pair. Write now for descriptive leaflet—It is post free.

HERBERT TERRY & SONS,
The Spring Specialists, **REDDITCH, Eng.**

SELFRIDGE'S

YOU can have immediate possession of any of the Motor Cycles listed below on payment of a fifth of its cost.

Payment of the balance can be extended over a year. For this added convenience we charge 2½% on the balance only.

The extra is only 2%, or less, on the entire cost of your machine. The greater your original deposit, the less your machine costs in proportion.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.
York and Lancashire.

'Phone—Holborn 5777.
Wires—"Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry" or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

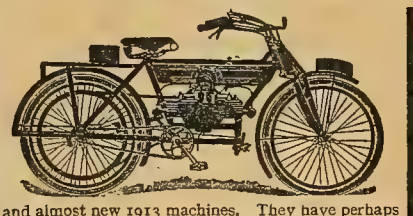
ESTABLISHED 20 YEARS IN THE HEART OF THE TRADE

Being the close of the season, the Colmore Depot have a few exceptional bargains in

SHOP-SOILED



and almost new 1913 machines. They have perhaps been used only once and are in every way as good as new, carrying the makers' full guarantee. There are amongst them one or two

DOUGLAS (Models R. & O.),
MATCHLESS, 8 h.p. and 3½ h.p., 2-spd., 3-spd., and 6-spd. models.
One only TRIUMPH (3-speed).

By taking advantage now of the **very special** allowance we are prepared to make upon second-hands in part payment for the above, buyers will be able to obtain a practically new machine, which upon selling, perhaps next year, they will lose little or nothing.

Cash buyers will receive special consideration.
Our ordinary second-hand stock has also been considerably reduced.

OBSERVE

SOLO MOUNTS.

BAT, 3½ h.p., 1913, 3-speed, very fast, new..... **£50**
TRIUMPH, 3½ h.p., 1913, 3-speed, slightly soiled **£52**

NEW HUDSON, 3½ h.p., 1913, 3-speed little used **£48**
PREMIER, 1911, 3½ h.p., f.e., scarcely used.... **£25**
MATCHLESS, 1913, 6-speed, 3½ h.p **£49**

Satisfied customers are the real basis of business success.

SIDECAR OUTFITS.

NEW HUDSON, and coach-built sidecar, three weeks old (taken against cycle car)..... **£60**
MATCHLESS, 1913, chain drive (cost £87) with Canoelet sidecar **£73**
HUMBER, 1912, 2-speed, with sidecar, new.... **£36**
SCOTT, with C.B. sidecar, a glorious turnout.... **£70**
CHATER-LEA, 1911, 8 h.p., 3-speed and sidecar **£50**
B.S.A., chain-driven, and sidecar, 1913, 2-speed.. **£54**

CYCLE CARS.

For something simple, light, and cheap, how about
A.C.'s (three wheels) at **£75.**
A.C. Single-cylinder light cars (showing shortly). The "wanted" £100 car.
MORGANS. (We have two of these at special prices. Come and see them.)
You with heavier purses cannot do better than an
ENFIELD AUTOLETTE. (Our demonstration model is being sacrificed at **£115,** all on complete).
Or an **A.C.,** 4-cylinder (showing shortly) at **£165.**

The Future of Long Distance Trials.

THE clamour arising from the recent much debated A.C.U. Six Days Trials is now dying down, and with the affair receding into the vista of the past, a calmer view can be taken of the proceedings than in the heat of the event. Our own attitude has been previously expressed, and we do not intend to write any further criticism either of the trials or the dissatisfied competitors. Let us rather look forward and try to enter into some constructive ideas for the future conduct of these trials. We refuse utterly to believe that they have now served their purpose and that no good can be gained by their continuance. For the advancement of design competition is necessary, and, probably, always will be so.

How then are the awards in these trials to be made with benefit to motor cyclists and the industry and without placing an undue premium on the skill and agility of the riders? Before going into this matter it is well to remember that the Six Days Trials have rather outgrown the purpose for which they were introduced. In the old days it was rather the effort of the promoters to see how many machines could be got through to the end—nowadays the aim is rather to find a course so severe that difficulty is felt in surviving the test, that the glory, therefore, shall be all the greater for the fortunate survivors. The difficulty now is to find a course sufficiently severe to be anything of a test. The general advent of change speed gears has made the difficulty all the greater, but the use of such mechanisms has in turn been brought about by means of severe trials. This is a strong argument for the desirability of continuing the Six Days Trials.

But we are not in favour of the adoption of anything in the nature of "freak hills and abnormal surfaces." We do not believe that one motor cyclist in a thousand has the slightest wish or need to go over such roads. He wants a machine that is certain to climb any ordinary road hill at a fair speed, attain a good rate of speed on the level, and able to run slowly in traffic. In other words, a truly flexible mount. Therefore we think that the flexibility tests in this year's Six Days Trials were a great step in the right direction. We would also have liked to have seen a slow hill-climb, say up the first mile and a half of Kirkstone Pass from Ambleside. Ability to climb slowly is of infinitely greater value to the tourist than being able to ascend hills at a high rate of speed.

Now with regard to next year's trials we would suggest the following ideas to the careful consideration of the Competitions Committee of the A.C.U. First of all make the event more of a tour than a trial. Let the distance be 1,000 miles in the week, and let the course lead from town to town, or if that is inconvenient let two centres be selected, and hold three days of the test from each centre. Do not allow any unusually low gears to be fitted, preferably insist on machines being entered exactly as supplied to the public. In the case of the different classes let certain ratios be fixed as the minimum gear for top speed—say 5 to 1 for all machines up to 500 c.c., and 4½ to 1 for larger powers. No solo mount to be geared lower on bottom gear than twice the ratio of the high gear. No alterations in ratios during the trial should be allowed, and if adjustable pulleys are fitted these should be sealed at the required position. No hills to be included that are not to be found on any recognised secondary road portrayed in the ordnance maps. This would give ample scope in selecting a sufficiently stiff course.

We would also propose that no spare parts of any description be allowed. It is not unusual for high-class machines to run a thousand miles without renewals of any description. We all know that a good belt, chain, or tyre is capable of such a distance. Let the makers of the machines and accessories, then, put them to a public test. Allow the riders to carry the usual kit of tools supplied to the public and a puncture repair outfit and nothing more. In particular we would like to see spare chains, belts, tyres, and valves absolutely taboo. A machine going through a trial in such manner would be a real indication to the buying public of what it could do.

Last, but by no means least, we commend to the A.C.U. the idea of finishing the trial with a fifty mile speed test on Brooklands. This should be an absolutely non-stop affair, and certain set minimum speeds should be allotted to each class of machine, and marks allotted or deducted according to such speed being exceeded or failure to reach it being recorded. Thus supposing 35 m.p.h. were set for the 500 c.c. machines, if the rider failed to do more than a mean speed of 30 he would be deducted five marks, if he achieved 40 he would gain five marks. Each stop should be penalised, say, 20 marks. We believe these ideas, though quite in the rough, are worthy of earnest consideration by the A.C.U.

OCCASIONAL COMMENTS

by "IXION"

The Dangers of Carrier Riding.

I hope that most of my readers have read, marked, and inwardly digested the lengthy list of fatalities occasioned this summer by the perilous practice of carrying a passenger on the carrier. In ordinary go-ahead riding there is no more danger in carrying a pillion passenger than in riding solus. The crux comes in a tight place, and all of us who are veteran riders know that emergencies are always sudden and unexpected, and that we have swerved out of a few hundreds in our motor cycling histories. The point is that the added heaviness of steering with an extra 9-12 stone on the carrier so often makes it utterly impossible to emerge from the tight place by a hair-raising last minute swerve. Personally, I believe the practice is so dangerous that it might even be rendered illegal. I have personally witnessed nearly a score of spills during the present season, all directly due to the practice: the majority of them would probably have been avoided if there had been less weight on the back wheel, and in half the instances the injuries sustained were quite serious.

Noisy Speedometer Drives.

I daresay I am growing more fastidious than I used to be, but I have been very worried during the past two years about noise emanating from the driving gears of my speedometers. It is, naturally, rather a tall order to expect a pair of uncased and unlubricated gear wheels, revolving at a point where rust and mud abound, to retain both accuracy and silence for prolonged periods; and it is not surprising that noise is the early and inevitable result. What I have to say probably applies to every speedometer on the road, but I will take a typical example. Early last year I fitted one of the best speedometers made. I had some trouble in adjusting the gears to run with the absolute silence that denotes accurate register, seeing that the gearing never come into quite the right register with the light clips and bolts at the first time of asking. However, I finally got the gears set so that they revolved without a sound, and the readings proved accurate down to a very small margin, which was amply explained by a trifling discrepancy in the tyre diameter. As last season progressed—there was plenty of mud about, you remember—the drive got very noisy. When I bought my first 1913 machine, I transferred the speedometer bodily to it, and found that the gears were noisy, and had lost the niceties of accuracy. The courteous makers soon provided me with a pair of new gear wheels, which were easily substituted for the worn pair, the job taking perhaps an hour. After a thousand miles, covered in the earlier and damper period of the season, the new gears had in their turn developed noise and inaccuracy. Fortunately, the gears of a speedometer cost next to nothing, and the fastidious rider can easily replace them at frequent intervals without appreciable trouble or expense. But it seems foolish to surrender to such an unmechanical bugbear, if there is any easy escape. Surely, it would be a good thing if any large firms, possessing big outputs of counter-shaft driven machines, with rigid drives to the rear wheel, were to incorporate a counter-shaft gear wheel for the driving of the speedometers. Without a doubt, self-respecting car designers are beginning to grow ashamed of the unprotected front wheel speedometer drive, and we do not want motor cycles to lag behind. It would be a further advantage if we could transfer the heavy speedometer dial and its trailing sheath from the handle-bar to the top tube. [This is now done by at least one maker.—ED.] I could drive my early machines at high speed "hands off" on a good road; but I cannot play these tricks now that speedometers are attached. As my readers know, the belt-driven speedometer, to which I referred a month or two ago, proved to be an unmechanical compromise designed to overcome the peculiar difficulties experienced in fitting a gear drive to a certain spring fork of foreign origin. As we get more standardisation, and the market becomes concentrated into fewer hands, these charming refinements should become more numerous. In the meantime, if we want silence, we must replace the gear wheels at rather unduly frequent intervals.

When Detachable Wheels are Handy.

It is fortunately seldom that a motor cyclist really feels the need of a detachable wheel at all urgently, but the accompanying photograph shows that such emergencies can arise. The print shows the condition of the rear wheel of a Clyno outfit, as revealed to the horrified owner when he at last realised that something was amiss with his back tyre, and it is peculiarly interesting in that the very dogged nail in question made three several attempts to penetrate the rim of the back wheel before it found a spot soft enough for its purpose. Lest the captious should enquire whether the owner was drunk, seeing that he failed to notice the escape of air until the rim had been thrice punctured, we may offer the ample explanation that he was accompanying the Carlisle trials over one of their roughest routes. The value of the detachable wheel is proved by the sworn statement that the sidecar proceeded on its way within five minutes of the stoppage.

Something like a puncture! A nail which went right through tyre and rim of a Clyno detachable wheel.

Holmside Bank and the A.C.U.

I am one of the few riders who have been familiar for several years past with the by-roads and precipices selected for this year's A.C.U. Trials, and riders who wish to form an accurate impression of the kind of task set in this event without going to excessive trouble, should stop at Durham on their way North and ask for the village of Witton Gilbert. When they arrive there, they should ask the way to Holmside Bank—the hill re-christened Little Honister by the competitors. This is an extreme example of the type of climbing feat demanded by the officials. It is perfectly true that any 3½ h.p. machine with a low gear of 8 to 1 could be coaxed up this hill by a daring rider. It is also true that very few men with such a gear would get up at the first time of asking. You approach it along a narrow cinder path, turn fairly suddenly to the left across a flat plank bridge, and then, hey presto! a kind of boulder screes shoots suddenly upwards at a grade of about 1 in 3½. If you begin your rush as you swerve on to the bridge, you cannot fail to scramble up the steep portion, provided you can stick in the saddle and keep the machine pointing in the right direction. When you are up the steep part, the road corkscrews for a few yards between narrow steep banks, and its surface is like a river bed, but the grade is not alarming: after this, a few hundred yards of easy climbing along a rutty grass track completes the ascent. In other words, such a hill is a splendid test of the riders, but no test at all of a machine. A hill like this has one useful function. It will provide an afternoon's fun for a party of sportsmen; but it is out of place in a serious technical test of a semi-scientific order.

A Libel on Me.

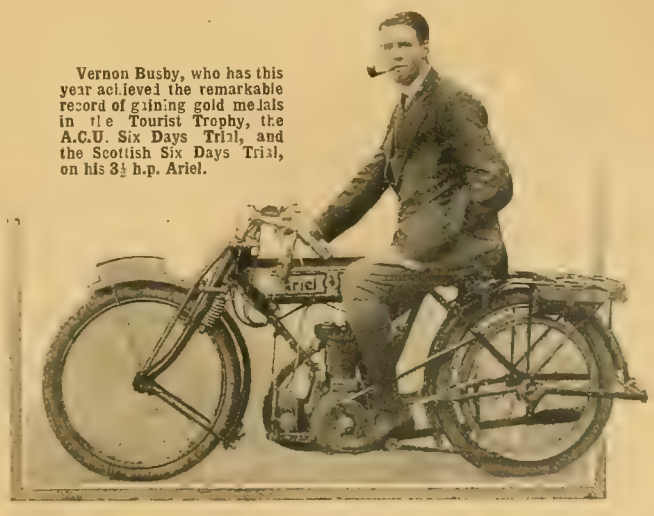
I am very frequently libelled, and my broad back usually sustains the curses uncomplainingly, but I really must arise in my wrath when I am accused of being a fierce and prejudiced critic of three-speed hubs. Indeed, impartiality can be so grossly misconstrued nowadays that one of my correspondents appears to fancy that I am a "bear" of Sturmey-Archer and Armstrong shares. I appeal to the files of *The Motor Cycle*. Did I not buy a sample of each in those critical early days when more cowardly riders were waiting to see whether the hubs would dissolve in their first hundred miles? Have I not consistently proclaimed the fact that I have had no trouble as yet with either make of hub? Is it not a fact that since these gears were introduced I have not owned a single machine which was not adorned with one of these hubs? Yet to-day, because I insinuate that a counter-shaft gear, equal in other respects to the three-speed hub, will deserve a bonus mark because it can claim the additional advantage of leaving the back wheel more readily accessible, I find myself derided, denounced, and vituperated.

If the three-speed hub enthusiasts say any more unkind things about me I will run my hub secretly unoiled for a thousand miles, and then dish up some fiendish copy about it, as others have done before me. Believe me, dear readers, I do not want anything more costly or weighty than the three-speed hub. My one desire is to see my three-speed hub transplanted to a counter-shaft position, and if it cannot be done this year or next, why, I'll wait.

In the meantime I am frightfully interested in Mr. Paskell's remarks to the effect that the rear wheel of a certain three-speed hubbed machine can be taken out "within five minutes of the time taken with a machine not fitted with a three-speed gear." I have been a betting man too long to jump at a challenge which has such a vague tail to it. "A machine not fitted with a three-speed gear" may mean anything from a traction engine to a locomotive. Does he mean a plain T.T. back wheel, with brake shoe external to the belt rim, and is he then speaking of a new pattern Armstrong hub? I am all agog for information, for I can (and have) changed the rear cover of a T.T. in well under fifteen minutes by the clock, but I have not yet succeeded in changing the rear cover of a three-speed hubber in less than an hour. However, that is a digression. I grant you the superiority of the three-speed hub for direct belt-driven machines; but are we really so ungrateful if we hope that by to-morrow we shall be offered a gear which shall add the accessible rear wheel to all the existing merits so fairly claimed for the three-speed hub?

When Solution is "Tacky."

The fatal word "tacky" in the small print under the lid of a tyre repair outfit has deluded many a good man and true in his salad days, and I have often ventured to warn the youthful motor cyclist that solution is not really tacky for about ten minutes after he is prone to imagine that the desired condition is attained. At last a kind friend has come to the novice's rescue with an infallible test guaranteed to decide when solution is or is not tacky. Take a penknife with a clean blade. Lay the clean blade flat against the solutioned tube or patch. Gently withdraw it. If strings of solution adhere to the blade, the solution is NOT yet tacky If the blade comes away clean and stringless, the solution is sufficiently dried for patch and tube to be pressed into a contact which ought to be permanent. I have not personally made the experiment, because I have not had a puncture since I received the communication, but it looks sound enough. At any rate it will warn the inexperienced that solution can hardly be overdry, and ten minutes spent in waiting for this result in patience will save much irritating delay later on.



Vernon Busby, who has this year achieved the remarkable record of gaining gold medals in the Tourist Trophy, the A.C.U. Six Days Trial, and the Scottish Six Days Trial, on his 3½ h.p. Ariel.

A NOVEL TRICYCLE.

A TOUR on a new machine has a considerable source of interest and fascination, but when that machine, with the exception of the back axle and engine, has been manufactured and put together bit by bit by is an additional fascination engendered. To give a brief idea of its construction, the rear wheels are used for driving, a balance gear being incorporated as a *sine quâ non*, the power unit being a 3 h.p. De Dion engine, and it has a three-speed gear worked entirely by chains and of such construction that each gear, when engaged, becomes a direct drive off a counter-shaft, this being contained in an oil-tight gear box, the box itself being constructed of sheet steel and cut out to lighten it, the cut out portion being covered in again by sheet duralumin. There is a clutch operated by a pedal and with ball bearings to take up all thrusts, and a starting handle.

The engine, magneto, and gear box are arranged in line along the back axle, the gear box being suspended in such a manner that it can be removed by undoing eight screws.

The body, also made of duralumin, is suspended by two C springs fastened to the back axle, and two blade springs fastened to the side tubes support the front end; the centre of the body also has a shock absorber, which is worked on the principle of an ordinary air pump, which acts in such a manner that practically all the weight of the body and person seated is resting on compressed air, which gives a delightful sense of easy motion on the road. From the illustration it will be seen that consideration has been shown with regard to wind resistance alike in the construction of the body, and the petrol and oil tanks.

All the controls are attached to the steering wheel, except the foot brake, operated by pedal, and hand brake at the side working on the front wheel. After a considerable amount of investigation a Senspray carburetter was fitted. The gear ratios are 4½, 7, and 11 to 1.

Weight Distribution.

In the design it will be noticed the engine is at the rear; in fact nearly all the weight is carried on the back axle, only sufficient being distributed on the front wheel for steering purposes. It was necessary, also, to keep the body fairly high to allow a good volume of air to pass underneath in order to cool the engine; in practice it was found to keep the engine particularly cool and with an additional advantage that very little dust is raised in the passage of the machine over the road.

After testing it on the road about forty miles and several minor alterations being made, the writer set out for a tour into the West of England and Wales, the first day's ride terminating at Salisbury, when it was found some eighty-two miles had been covered on rather over one gallon of petrol, which was considered quite satisfactory. From Salisbury onwards to the West the road surface began to get bad; at the present time the roads are suffering from the unusually dry weather; also from having been cut up by the military traffic. A motorist's tip to avoid part of the main road to Exeter was taken, and a detour made further north over the downland, but the surface of the roads here was anything but good, long stretches being covered with loose flints. However, the scenery and views are magnificent; naturally some of the gradients are severe, but the 3 h.p. engine and the three speeds made light work of them.

Across the Bristol Channel.

From Ilfracombe the writer decided to cross by boat into Wales, so the harbour-master was approached as to the possibility of getting the three-wheeler across on the passenger steamer. However, no promises were made without the consent of the captain. The harbour-master had decided to put it on board with a dock crane, but the captain of the boat would not have that as there was no similar facility for getting it off at either the Mumbles or Swansea, so it was eventually hoisted up and carried by four of the ship's crew across the passenger gangway. I had intended landing at Swansea, but the tide being low I was put off at the Mumbles pier, where the machine had to be hauled up a flight of steps from the lower pier deck, then up another flight to the top deck. At the end of the pier the roadway went up at an angle apparently of about 1 in 3 to join the main road. As this gradient seemed a bit too much for the 3 h.p., three pier hands were requisitioned to assist in hauling me up this at the end of a long rope. Much to my delight, the temporary assistance was not agile enough to do any quick hauling, and the machine very nearly overran them before we reached the top.

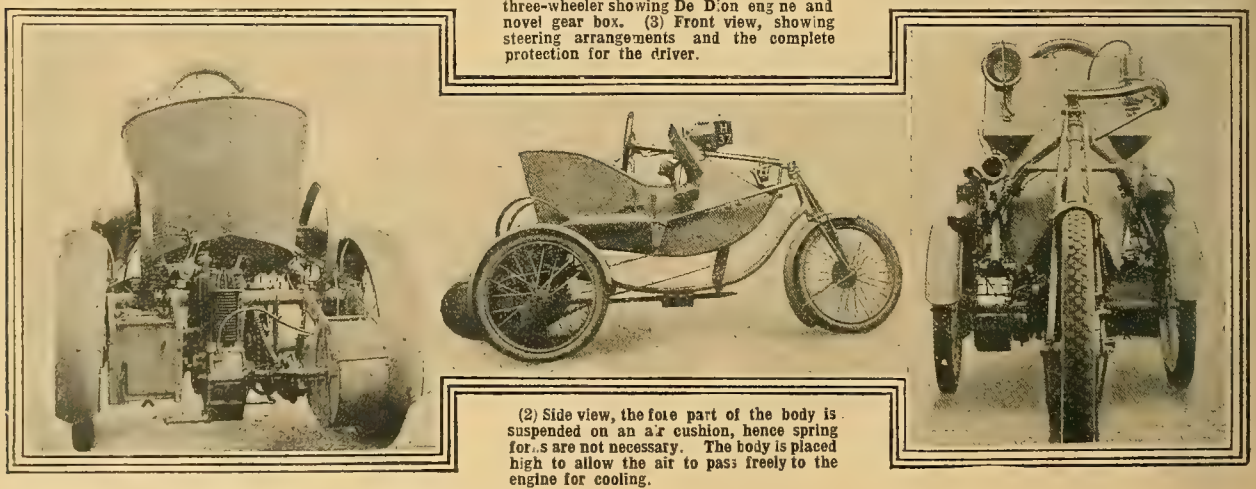
After touring through Llanelly to Tenby, I decided here to make a careful examination of the machine, and the following defects were noted: The magneto drive from the engine was distributed through a fork engaging with an arm with two slots on the magneto shaft, and one of the forks had sheared clean off. The drive from the clutch to the gear box is made through a flexible joint consisting of two pins engaging with holes in the end of the clutch casing; a considerable amount of wear had taken place here, otherwise no other defect had shown itself.

Neither of these defects, however, was of sufficient importance to prevent the journey being continued without recourse to a lathe.

On the return journey the writer took the main road back to Gloucester, *via* Carmarthen, Brecon, Hay, Hereford, and Ross, a most excellent road. A night was spent at Gloucester, and the next morning a start was made for London, *via* Cheltenham and Oxford.

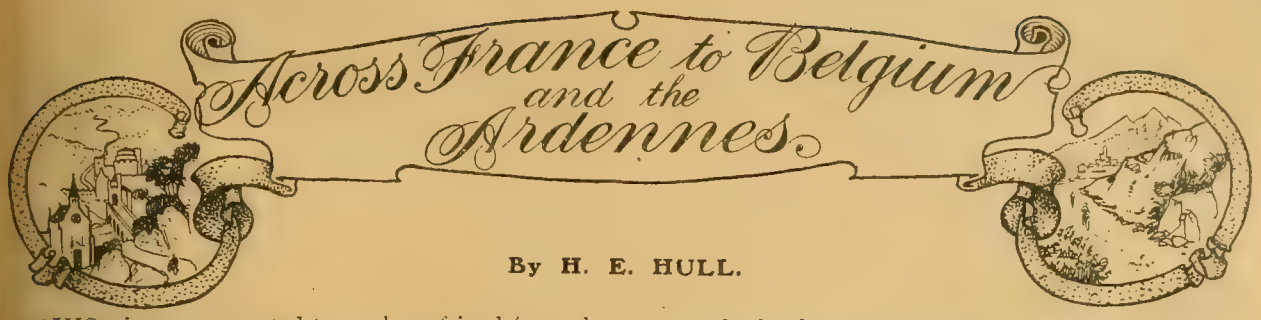
Altogether some 600 miles were covered on eight gallons of petrol. There was no sense of side-slip on greasy roads, and no tyre troubles were experienced. Altogether the trip was so successful as to show that a home-made machine can be quite relied upon if care and attention be bestowed upon it. The minor faults developed under test I shall remedy.

L.R.J.



(1) Rear view of L.R.J.'s home made three-wheeler showing De Dion engine and novel gear box. (3) Front view, showing steering arrangements and the complete protection for the driver.

(2) Side view, the fore part of the body is suspended on an air cushion, hence spring forks are not necessary. The body is placed high to allow the air to pass freely to the engine for cooling.



Across France to Belgium and the Ardennes.

By H. E. HULL.

THIS trip was suggested to me by a friend (named by the natives of France "*L'Homme dans le Panier*") who had a longing to visit Southern Belgium and the Grotte de Han. He fired me with the same desire, and hurried preparations were made. All being ready, we started the last Saturday morning in July, and after an uneventful run, reached Folkestone. Here I would confirm the advice of old motorists: use the facilities given by the A.C.U. or A.A. of booking man and machine from port to port. We found everything prearranged, and had only to empty our tank, see the machine hoisted on board, and follow, smiling at the foolish ones who had not taken the above precautions and were left behind.

The boat was crowded, and, though we were good sailors, were thankful it was a short and smooth passage, as the unwonted paleness of many of our fellow travellers gave us an anxious foreboding of unpleasantness to follow.

Boulogne at last, through the customs quickly, helped by the A.C.U. and A.A. man, and away we went to rest for the night at a little hotel, two or three miles out, in Pont de Briques. We had no intention of travelling by night, unless we were compelled to, as we wanted to see all we could of the scenery.

Sunday morning saw us up early, and away we went, after consulting our "Taride," straight across France, avoiding Lille, as we had heard that the *pavé* for miles around that town was too bad for words. This part of the journey proved monotonous, with the exception of our run through Samer, where we got our first taste of *pavé*, and the scenery was ordinary, so we indulged in some speed bursts on the fine straight roads. Oh! the exhilaration of long stretches at fifty and fifty-five in the terrific heat we were experiencing, then the quiet going over the excellent roads between Thérouanne and Houdain till we arrived at Arras, where we arranged to stop for the night. Soon after we garaged there came a mighty tropical downpour, and we were thankful we were out of it, but pleased to think of the dust being laid, as "*L'Homme*," etc., found it was entering his travelling bag in large quantities—at least he said it was dust, but I put it down to a broken bottle of tabloids in his medicine chest, as it was pure white and of a very fine consistency.

Across the Frontier.

The next day, after a look round the quaint, old-fashioned town, we started towards Cambrai, and had our worst taste of *pavé*—at least I did, "*L'Homme*," etc., was quite comfortable, and seemed highly amused at my discomfort. Needless to say, our progress was slow, so as not to shake every nut off the machine, or wrench the frame. We ought to have taken a road further south through Croisilles. However, we made for Valenciennes, where we had our first trouble—a puncture. After we had repaired this we set our course for Binche, crossing the frontier twenty kilometres from Bavai. The road from Bavai to the frontier, though straight, is practically nothing but a farm track through woods; I should not have cared to have been hung up here with any serious trouble, as there was not a town of any importance for miles.

A night's rest at Binche, and then through Thuin to Charleroi, the Belgian Black Country.

On the Wrong Roads.

At Thuin we began to gain experience in steep hills and hairpin corners, and the low gear began to be used for the first time. Here we unfortunately missed our way, and traversed roads that were worse than awful, the camber being atrocious in some places, with sharp turns and gutters intervening. It speaks wonders for the build of the machine, for had it been less solidly constructed the frame must have been wrenched in two. At last we reached Charleroi, with no more serious damage than four spokes broken in the back wheel, which, by the way, took us three hours to get repaired; the Belgian is not inclined to hurry himself, and always says "*Beaucoup temps*" if he finds you are almost dancing with impatience to get on.

On leaving Charleroi we took the wrong turning between Gilly and Châtelet; and what a road! First down hill, then a perfect switchback, with twelve to eighteen inches of side dips, and when once we had started there was no turning back, so we had to make the best of it and crawl as slowly as possible. Fortunately there was neither hedge, ditch, nor wall—nothing but a cornfield on either side. I expected every moment to part company with the sidecar, or turn turtle. After having my arms nearly wrenched out of their sockets I was unable to hold the machine any longer, and we took a swoop right through the corn, back to the road, and so to the bottom on the *pavé* in Châtelet, with a large crowd of the villagers watching our descent. I have no doubt they thought us mad for venturing down that track, for road it could not be called. I am certain that no mechanically-propelled vehicle had ever before been down that slope, which was coated with a fine black dust that appeared to be charcoal.

The *pavé* in Châtelet was in a frightful state, but seemed a dream of blissful ease after our last experience. Once well out of the village the roads improved, to our great delight and comfort, and were really good, the occasional patches of *pavé* not being worth considering. We travelled fast on this section, nearing Namur with our lamps alight, in the cool of the

Across France to Belgium and the Ardennes.—

evening, and thoroughly enjoying ourselves. At last there appeared before us in the distance a glowing, sparkling city, intersected by gliding stream and enchanting light: Namur at last, and thankful we were, as we had had quite enough for one day.

By way of digression, I would here say we had caused a ripple of laughter and looks of sheer astonishment in all the towns and villages through which we had passed, both in Northern France and in Belgium. Such a combination as a motor bicycle and sidecar had never been seen before. The whole population swarmed out of doors, leaned out of windows and shouted to their children; shuttered windows opened which had seldom allowed the light to pass their restricted portals; the coffee roasting by the roadside ceased, and all eyes were fixed upon the object of their curiosity.

View of Charleroi.

A glimpse of a road traversed.

The rocks at Dinant.

We stayed at Namur for the night, and spent a restful morning looking at the usual guide-book sights; then in the afternoon we made a delightful run through Fosse and Rosse to Dinant and back. The road from Rosse to Dinant is delightful—in fact all the roads in this district are first class.

The next morning saw us again at Dinant, which we made our centre for the day, motoring round to see the romantically situated castle of Montaigle, and returning to the Meuse valley we had a pretty drive towards Givet.

After a night's rest we made straight for Rochefort—as we intended to make this our headquarters for several days—along a beautifully wooded road, our only trouble being flies, thousands of which settled on our goggles, almost obscuring our sight.

The Grotte de Han, which is in this neighbourhood, was our next objective; it is considered to be one of the most wonderful sights in Europe, and certainly the vastness and majesty of this labyrinth of caves and passages, intersected by stream and lake, all in the bowels of Mother Earth, were awe inspiring, and a most delightful change after speeding over sun-scorched roads. The walk, which takes two hours, through the cool moist atmosphere, and then the row in enormous boats, or rather baby barges, by which means we made our exit, were most refreshing. (This was the only place at which we rubbed shoulders with the tourist element, our object being to keep off the ordinary track as much as possible.)

We made several runs from Rochefort, returning each evening to sleep. The one to Laroche was the best; the approaches to this little town, situated as it is at the conjunction of three valleys, are most beautiful. While on this run we had an amusing experience between Marche and Laroche. We were taking it easily uphill when a grey car with six passengers came up behind; we allowed it to pass, the occupants hanging over the sides, and looking over the back at the strange apparition. They evidently expected to see us fizzle out on the long hill, but we gave quiet chase, keeping up to the car, all on top gear, much to the amazement of its occupants and our amusement. On reaching the top of the hill the road makes a sudden descent into the town; down this the car tore at what I considered a reckless speed, stopped at a *café* and watched us enter the town, the inhabitants joining them. The sidecar was evidently quite a new thing, even to car owners in that part of the world.

Across France to Belgium and the Ardennes.—

They seemed very keen on finding out our nationality (although they might have known, for we were carrying a Teddy Bear holding a Union Jack as a mascot), and the make of the machine; "Belle machine" was the expression they used after they had made a thorough examination of it, and well it deserved their praise.

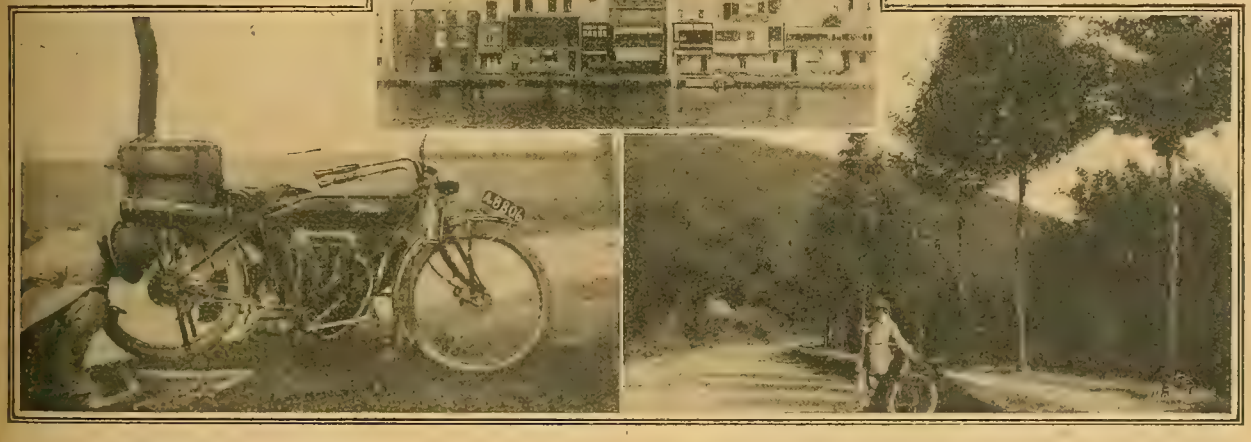
St. Hubert was next visited, and we then sped along a straight road lined with fir trees in the clear air and brilliant sunshine towards Baraque de Fraiture; here we turned to the left for Aywaille and returned through Bomal, Durbuy, and Marche.

Our next excursion was to Liège, and here, or rather at Ougrée, a suburb, our troubles commenced; our back cover blew off, and as the inner tube looked past repairing on the road we cut it out, and on inserting the new butt-ender found to our dismay it would not meet by an inch, although marked 28 by 2½.

After a final examination to see if it were possible to make it meet, and finding it would not do so, there was nothing for it but to pump it up and trust to luck; the inevitable happened, the end blew out. This was the last straw; here we were at Ougrée, four miles from Liège, in a roasting sun, with not a scrap of shade to be seen, a smelting works or blast furnace towering over us, workmen's dwellings all around, no garage, not a decent *café* in sight, as hungry as could be, and at our wits' end to know what to do. At last, to our joy, a good Samaritan hove in sight on a purring 2¼ h.p. F.N. He told us he was a doctor at Ougrée, and would get a cycle dealer to ride into Liège and see what he could do. Here "*L'Homme,*" etc., had his worst time during the trip; he declined to get out of the "basket," so I went with the doctor to the cycle shop. When I got back I found he had been compelled to remove himself, as he was nearly baked, and was reclining in a dry ditch surrounded by a crowd of dirty little boys, who were tantalising him by drinking some sort of liquid out of a bottle. The cycle dealer returned from Liège after a wait of about two hours, and said that the tubes could not be repaired that day, but that they would be ready by the next morning, so leaving the machine in his hands we trained it back to Rochefort. On returning the next morning we found the tubes repaired, inserted, and all ready for us, so getting into position we started, cheered by a huge crowd which had surrounded the machine. Our troubles, however, were not at an end, for, eight miles out of Liège, again that horrible report, followed by sundry squeaks and bumps, told the tale of another burst; we gaily put in the fresh tube, but after a few yards found this was down, leaking past the joint the repairer had made. Having made a vain attempt to patch it, we started to push, and after half an hour's hard work we arrived, footsore and weary, at the Hotel du Cercle, Sprimont, whose hospitable portals we were only too glad to enter. The first thing the next morning we wired to London for two new tubes, as we found our size was unobtainable either in Liège or Brussels. Moral: If you use odd size tyres, take plenty of spares with you, and see that they fit properly before you start. Here we spent a lazy time for six days, as the tubes did not turn up, although we had heard they had left London the same day as we wired. After repeated enquiries at the Post Office we discovered that they had been lying at the Customs. You may imagine our delight when, at last, we did get them, for leave of absence was drawing to a close, and we were anxious to get home.

The new tube in, off we started as fast as our Indian would take us, away through Aywaille, Hamoir, Dinant, Givet, Rocroi, St. Quentin, Amiens, and Doullens, to Boulogne, only stopping to sleep when

Another view of Dinant.



A halt to replace spokes broken by rough pavement.

Laroche. Note the washing drying on the grass at the side of the road.

Near Laroche.

night closed on us. This route proved excellent, the roads good, and the scenery magnificent, especially in the French Ardennes. The high speed and the occasional bumps and jumps over *pavé* found out the weak spokes, which kept breaking. We got eight new ones of a thicker gauge put in at Montreuil, and these held up all right.

We arrived at Boulogne four hours before the boat left, having covered just under 1,000 miles. The engine was never touched the whole time, and gave no trouble of any sort. Once, on our homeward journey, it did not pull as well as it had been doing; this we found to be due to a bad sample of lubricating oil; on getting "Huile A.D." everything went well again.

Punctures—hobnail punctures, in spite of nail catchers—proved to be the only flies in our ointment of enjoyment. We went as "globe trotters," right off the beaten track, sleeping where we could, making bee-lines when able, taking things as we found them, eating the native food, drinking the native drink, and thoroughly enjoying ourselves; we saw more of that part of the Continent than an ordinary tourist could have done in six trips.

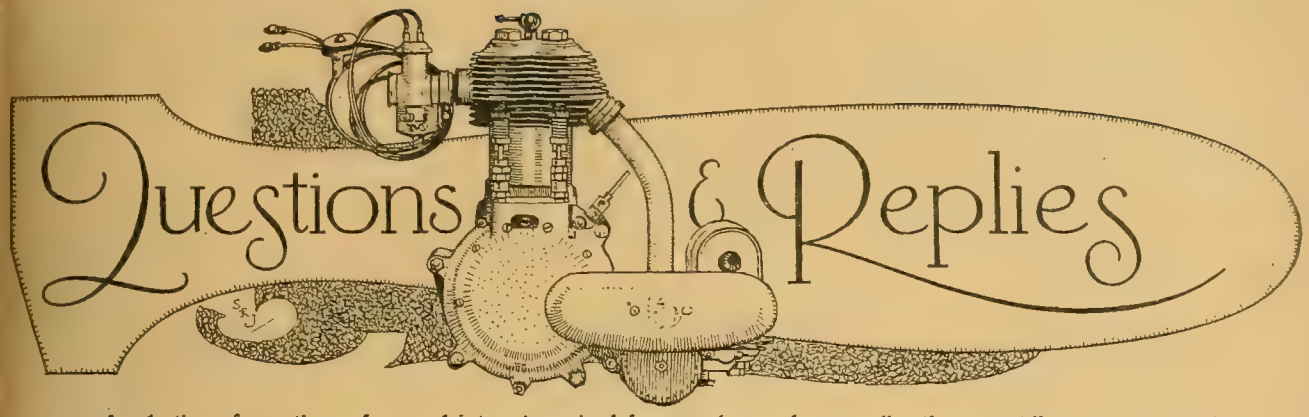
In conclusion let me say, do not be afraid of taking a trip of this sort because of a limited knowledge of French. We had not more than a hundred words between us, yet, with all our misfortunes, had no difficulty in getting all repairs done, and with very little loss of time.

The Question of Abnormal Gearing.

THERE have several times been suggestions going about that abnormally low gears should be abolished in competitions, because many imagine that such low ratios are not usually supplied to the public. This means that the wretched member of the public, who, desiring to get far away from the madding throng on his 2¾ h.p., which is so handy that it can pick its way anywhere, is hoplessly knocked out on one of the first pitches of one in four he comes to. It is all very well to argue that no sane man wants to go over roads like those that became a bone of contention in the Six Days Trials. Provided the scenery is fine and the road is negotiable, the desire to explore the beauty spot away from the beaten track and the dust of cars is exceedingly keen. The country doctor who is called out to visit some poor patient on a lonely moor must travel over roads quite as bad as those covered in the much debated trials, but is he to be denied what is termed a freak gear because it is going to enable him to reach his destination? The very idea is absurd. It is perfectly certain that the bottom gear of any motor vehicle should be an emergency gear, not a gear to drop into on every single figure gradient, but a device for use in abnormal circumstances.

What, then, is a freak gear? The term is an objectionable one which is unfortunately too often met with in motor cycle circles. Really there is no such thing. In penning these words I have in mind certain machines of well-known make but of moderate horse-power which were geared quite normally on top but very much the reverse on low, in Lakeland, so that they might climb any gradient. This big gap between the two ratios made the gears difficult to change, and consequently by no means commercial propositions when thus equipped. But were these "freak" gears? Emphatically no! But what was the matter? Certainly not the lowness of the low gear, but the size of the gap, if I may use the term between the two speeds. The real fault was something missing—the intermediate second speed, the absence of which no adjustable pulley can make up for. Some of the sidecar combinations had 16 to 1 bottom gears, but they had three speeds, and consequently no one can have any fault to find. To set a limit on gear ratios would be a retrograde step, and would hinder development, and I am inclined to believe that the two-speed gear will die, and the three, or even four, speed gear will come in just as it has done in the car industry.

AILETTE.



Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Manufacture of Petrol.

Could you give me an outline of the method of manufacturing petrol from the raw spirit, and what is the waste matter from this process used for?—W.D.

Raw petrol is a thick treacly substance, which is distilled in the ordinary way. At the first distillation very volatile substances are extracted, which, however, are too light for use as motor spirit. At the third or fourth distillation ordinary petrol is extracted, and in the case of subsequent distillations a heavier grade of petrol is extracted. Gradually heavier and heavier oils are produced until we come to paraffins, which are not volatile at all at ordinary temperatures. The heavier oils can be used in Diesel engines.

A Carburetter Difficulty.

I have a 3½ h.p. Rex with B. and B. carburetter, which has run well up to a week ago. I have been running on very little gas, and the air lever wide open, for the past three months, when on going down a steep hill lately I shut off the air as usual and went down against compression, and on arriving at the bottom I opened the air, but the machine did not pick up as usual. I had therefore to open the throttle half-way, and the machine started up all right; but when I opened the air the engine refused to take it; consequently the engine runs very hot quickly, and seems to lose power. I use best petrol. The engine has not been taken down since the machine was bought. To coast down hill against compression I have to close the throttle, as the air lever will not perform that duty. I hope you will be able to explain the difficulty.—J.H.F.D.

We think the trouble is due to something being sucked up into the jet, which prevents the free passage of the petrol, so causing the mixture to be too weak. It is also possible that the air slide has stuck. To gain the use of compression as a brake, you should nearly close the throttle and open air wide. Clean out your carburetter thoroughly with petrol, and see the jet is perfectly free. The trouble should then cease.

Big Power for a Novice.

I recently purchased an 8 h.p. Matchless and sidecar, and, having learnt to drive it with the sidecar attached, I am ambitious of trying to ride solo. However, as several of my motor cycling friends say that it is impossible for a novice to ride so high-powered a machine, I write to you asking if this is correct. The danger they say is, if the machine gets off the balance it is impossible to regain equilibrium as the weight is too great. I do not quite understand this, and should be glad for any hints or advice you may care to send me on the matter.—W.B.H.

The machine you mention is primarily designed for sidecar work, and you might not find it a very comfortable solo mount for a novice. However, there is absolutely no reason why it should not be ridden solo, but you must remember that it is a very powerful machine and requires fairly skilful handling, and until you are absolutely satisfied that you are capable of taking any powered machine solo we do not advise you to experiment in this direction, but to stick to your sidecar, for which the machine in question is highly suitable.

A Touring Query.

I should be obliged if you could let me know the best motor cycle route from Wellington (Salop) to Weymouth, and also information with regard to cost, etc., of the A.A. and M.U.—J.A.J.

Your best route would be as follows: Wellington, Bridgnorth, Kidderminster, Worcester, Tewkesbury, Gloucester, Stroud, Nailsworth, Bath, Radstock, Shepton Mallet, Castle Cary, Yeovil, Dorchester, Weymouth. The A.A. and M.U. motor cycle subscription is 10s. 6d., further particulars of membership can be obtained from the Secretary, Fanum House, Whitcomb Street, W.

Military motor cyclists who are taking part in the Belgian Army manœuvres.

A Long Day's Run.

Will you kindly give me particulars of the best route to Scarborough from Farnborough, missing towns as far as possible, and also the distance, and whether it could be done in a day with a 3½ h.p. three-speed Rover and sidecar?—W.H.B.

Your best route would be as follows: Farnborough, Bagshot, Windsor, Slough, Beaconsfield, Amersham, Chesham, Tring, Dunstable, Ampthill, Bedford, Eaton Socon, Stilton, Stamford, Grantham, Newark, Tuxford, Retford, Bawtry, Thorn, Howden, Market Weighton, Great Driffield, to Scarborough. The distance is approximately 254 miles. The journey is rather far to be accomplished in a day with a 3½ h.p. and sidecar unless a very early start is made.

Ignition Difficulties on Horizontal Twin.

What is the h.p. of my Fairy horizontal twin engine? I am told it is about 1¾ h.p. As the bore and stroke are 59 mm. × 57 mm. is this about correct? I am firing the engine by means of a single-cylinder magneto running at engine speed. This will give one spark for every revolution of the engine, and as the engine fires once every revolution this is correct. By means of a rocking distributer the current is guided to the proper plug. This distributer is very unsightly, and quite spoils the appearance of the engine. What I want to know is, if it is possible to fire both plugs simultaneously in each cylinder by attaching the high-tension wires direct from the magneto to the two plugs? If this is possible one spark will take place on compression, the other on top of the exhaust stroke. When retarding the spark will there be much risk of the carburetter catching fire, as when retarded the spark will occur a little way down the induction stroke on one cylinder?—E.C.H.

The rating given you, viz., 1¾ h.p., is the rating given by the makers at the time. It is possible that it develops more power. With regard to your ignition difficulties, we strongly advise you to stick to the distributer, even though it is rather unsightly; this, after all, is a minor defect, provided it works well. There is no fundamental difficulty in working both plugs from the single magneto, but as an electric current invariably follows the path of least resistance, unless the plug points are equally adjusted, it will only fire on the one with the smaller gap. If you utilised a double-pole plug it would probably get over the trouble, but we should not like to give you any definite assurance on this point, and must leave you to make the experiment yourself. With regard to the carburetter catching fire from the idle spark, there is a possible risk of this occurring, but as the gas is not under compression the risk is slight.

Starting Difficulties.

I have just purchased a Moto-Rêve twin lightweight and think the timing of engine is somewhat at fault. Could you give me some advice on the following points? (1.) When the exhaust valves should begin to open. (2.) The timing of magneto is fixed; what do you consider the best position to set it for all-round running? (3.) The most suitable gear; it has been running 7 to 1, but engine seems to overheat. (4.) It is easy to start on the stand, but most difficult to start on the road. I am using Amac carburetter, twenty-four jet. Can this be got over? Compression is very high. I should be greatly obliged for a little advice.—H.N.T.

(1.) Your exhaust valve should begin to open when the piston is on the downward stroke about six-sevenths of its travel. (2.) The contact points should be just about to separate, when the piston is at the highest point of its stroke. (3.) About 6 to 1 should be a suitable gear. (4.) It is quite impossible to advise you how to adjust the carburetter, as this is a matter which can only be done when one sees the machine. The jet you are using is about the right size. Shut off all air when you start, and open the throttle about one-third. This should give the best position.

Buying an old Machine.

I should be greatly obliged if you would advise me on the following: (1.) Could I get a second-hand lightweight, say 2½ h.p., to be of any use for £10 or £12? Would such a machine be often out of order if treated carefully? (2.) Could such a machine be run on, say, 5s. a week if only used for pottering about for about fifty miles a week?—E.R.B.

You might possibly pick up a decent machine for this money, but you must not expect anything in first-class order; or, if in good order, it would not be up-to-date. It is possible that you might get a good deal of fun out of such a bargain. This is largely a matter of luck. If in good order you should be able to run the machine fifty miles a week for less than 5s.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"H.G.J." (Cardiff).—1912 Clyno and sidecar. Reliability of gear.

"H.L." (Newport, Mon.).—Dissolved acetylene lighting for cycle car.

"X.X.X." (Runcorn). — Scott. Reliability, petrol and oil consumption.

"J.S.C. (Sutton Coldfield). —1913 Triumph T.T. Roadster. Speed, petrol consumption, and size of jet.

"G.S.M." (London). — Four-cylinder F.N. Also suitable two-lever carburetter.

"G.D." (London).—2½ h.p. F.N. shaft drive, two-speed, plate clutch, 1912 or 1913 model. Power, reliability, wear, and economy.

"A.I.B." (Glasgow).—3½ h.p. three-speed New Hudson. Reliability, hill-climbing, and consumption.

"J.K." (Llanelly).—5 h.p. F.N. 1913 two-speed. Carburation, lubrication, clutch and gear, power on hills for sidecar work, and reliability.

"C.T." (Wanstead).—Scott. Flexibility, lubrication, hill-climbing, and general reliability.

"B.W.W." (Hendon).—3½ h.p. Indian two-speed. Reliability, hill-climbing, consumption, and ease of starting with benzole.

"W.R." (Kerry).—1913 two-stroke Connaught and Levis' machines. Reliability, speed, hill-climbing, and consumption.

"J.N.B." (Lawford).—Lukin and other automatic carburetters with 8 h.p. three-speed cycle car or sidecar. Easy starting, speed, hill-climbing, and lubrication.

"G.H.I." (Cornwall).—Best two or three-speed machine and weatherproof sidecar. Hilly district. Speed, silence, and accessibility. Comfort of pan-shaped saddles.

The sender of the above photograph, which was taken in Finland (Mr. J. O. Williams, who is seen on the finger), draws attention to the path through the open forest to the "Garage," which he refers to as "The Toiler's Rest." The other machines are a 3½ h.p. two-speed Humber and sidecar and a four cylinder F.N.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Benzole.

Sir,—I have recently been given the following facts by a friend with regard to the use of this spirit. His machine is a 3½ h.p. Zenith-Gradua (1910), and has done a large mileage.

He asserts that he filled up his tank, which was empty, with one gallon of benzole at Abergele, from which town he rode to Stoke *via* Chester and Stafford, a distance of 97 miles, in three hours and a quarter, and on examining his tank at a garage there he found only just one quarter of the gallon had gone. He called the attention of the proprietor, who confirms his statement.

I have tried to explain that a consumption of nearly 400 miles to the gallon at an average speed of thirty miles per hour on a 3½ h.p. machine is impossible, but he can only reassert the facts, of which he is confident.

Can any of your readers tell me if there is any chance of such figures being correct? NESH.

Fair Treatment.

Sir,—You from time to time publish letters from correspondents under the above heading. Being on the staff of one of the largest motor firms in the country, I should like to express my views from the firm's standpoint.

The delays and unbusinesslike attention complained of are, as a rule, the fault of the customer, or largely contributed to by him. As often as not his goods or telegraph money order will come in without any name, or at times the goods bear another name, *i.e.*, the name of the agent or garage that has not been mentioned in any correspondence. Such stupidity invariably causes much delay, and matters of this kind are only cleared up with great difficulty after imposing a lot of extra work on the clerical staff in the height of the season. In many cases such transactions are altogether unprofitable to the firm, as any profit there might be on the transaction is absorbed by the cost of the time taken up by members of the staff. ONE INSIDE.

Sir,—I have read all the correspondence in your journal *re* the above, and would like to relate my experience.

I purchased a well-known make of lightweight late last year, and after having it nearly three months, the frame broke below the steering head, through the joint being badly brazed. I at once saw the makers' local agents, who cabled home at my expense, and they, not knowing the price of a frame, made the following terms: 10% on landed cost. When the frame arrived I received an account for £10 10s. In the meantime I had written to the makers explaining everything and pointed out to them that an allowance should be made on the new frame, seeing it broke within the guarantee period, *i.e.*, three months. The makers replied saying that I must return the broken frame, and, if they found the frame broken through no fault of my own, they would make an allowance.

Being very inconvenient for me to return the frame, living in such an out-of-way place, I asked them if they could not let me have the frame at cost price, which I was willing to pay. They then wrote and said they could not let me know the cost price. Therefore I have had to pay the £10 10s. for the new frame.

I am afraid I have not been quite so fortunate as some of your readers, and it seems a shame that we Colonials are treated so badly. The same thing applies to spares, etc.: we are charged on many articles something like 300% above home retail prices.

I always look forward to your journal every week, and wish it every success G. A. MAUCH.

Bloemfontein

Factory Repairs and Agency Tinkerings.

Sir,—Having come across a copy of your healthy paper, *The Motor Cycle*, I was much interested in the comments of your correspondents on "Fair Treatment." It is pleasing to note that there are some firms who are ready to acknowledge their responsibility to motor cyclists.

My own experience has been that motor cyclists seem to be lacking in the necessary backbone which would enable them to obtain recompense for a breakdown clearly due to faulty workmanship. To illustrate what I mean, allow me to give the history of a case which came under my own personal observation. As an engineer, with no interest in motor cycles, I was called upon to give a report on a breakdown on a twin motor cycle.

The owner of the cycle had occasion to go to a Midland firm to have a new crank pin made. Owing to making this crank pin smaller than the original one it was necessary to make two new bearings for the big ends of the connecting rods. One of these bearings was a fair fit, the other was very much too large, with the result that this play broke the gudgeon pin adrift, smashing up the piston and cylinder, besides damaging the connecting rod.

Here was a clear case of "disgraceful workmanship," and, as I understand, the so-called "motor engineer" repudiated all responsibility because the breakdown did not occur until some months after the repair had been made, and in spite of the owner being able to prove to him that the machine had never been used owing to his absence, that the breakdown took place within twelve miles of the start, and that the tool marks could still be seen on the large bearing.

Is there not an association who look after the interests of motor cyclists? for I am convinced as long as motor owners will allow themselves to be fleeced by outrageous charges for (very often, I fear) faulty repairs, so long will they get the results obtainable from those professing to be engineers, although lacking in an elementary mechanical experience.

It is pleasing to record that the motor cyclist in this particular case has at last been prevailed upon, after a good deal of trouble, to bring this matter into court. It is to be hoped that others will follow his example.

I trust some of your correspondents will take the matter up with the object of obtaining a better service for motor cyclists. TURNER.

An Auto-Wheel attachment fixed to a tricycle the property of Mr. W. E. Allison of Withernsea.

Beverley and Leamington—Warnings.

Sir,—At Beverley, on Saturday, the 6th inst., I was fined, along with about six others, 10s. and 4s. costs for riding with my cut-out open.

The exhaust passes through the silencer before reaching the cut-out, and by the wording of the Act this is permissible, as long as little noise is being made. The road was perfectly level at the point where I was stopped. I was travelling at about 15 m.p.h., and there was no wind, so that you can imagine that I was making little noise.

I should be glad if you would warn your readers against making any noise in this district as the police are most keen.

C. H. FELL.

Sir,—I wish to warn all motor cyclists who live near or have to pass through Leamington to be careful to take corners on the right side of the road and not to go faster than a crawl, as, if they do, a summons will be the result. Recently there was a police trap working in the Kenilworth-Lillington Road, and, as a result of same, a batch of motor cyclists were hauled up for various offences, the fines ranging from over £6 down to a few shillings. I do not write this letter because I was one of the unfortunates, but, as I have said before, to give warning to others. For turning a corner on the wrong side (in my opinion to avoid an accident) I was fined £1 11s. inclusive, to say nothing of an endorsed licence. This was called "driving to the common danger," and my speed was so slow that I conked out, and no one was touched or even within yards of me. I might also mention that one is not intimated that proceedings will be taken until a few days afterwards when the incident is forgotten. Hence you have no witnesses. So motor cyclists in Leafy Leamington, beware!

AD SUM.

The A.C.U. Six Days Trials Course.

Sir,—Having read Mr. R. C. Measure's letter, with reference to the A.C.U. Six Days Trials in your issue of the 4th inst., might I be allowed a small space in your valuable journal to draw attention to the following facts:

No one likes to feel that he has been "done." To be told officially that one is expected to do one thing, and then, when one gets on the course, to find one has to do something else very much harder and for which one is not prepared, is by no means "sportsmanlike."

Why could not the A.C.U. have told us (like the Scottish officials did) that the roads were abnormal and that water-splashes over a foot deep had to be taken in non-stop sections?

I am perfectly aware of the fact that the A.C.U. afterwards took no notice of failures on one or two portions of the course. Here again I should like to point out that, never knowing quite how one stands throughout the trial is an unsatisfactory state of affairs—in my own humble opinion, at all events.

I am always perfectly willing to enter for any really sporting trial provided I have the time (I always have the inclination), but for goodness sake let the organisers tell us beforehand what we are expected to do.

A. W. BRITTAIN.

[With regard to watersplashes, Mr. Loughborough, secretary of the A.C.U., stated in his letter published in our issue of Sept. 4th that the deepest had eight inches of water running over it on the day in question.—ED.]

Hub and Counter-shaft Gears.

Sir,—With reference to the disputes in your columns about hub gears, may I be allowed to give my experiences. Last Christmas I had my 3½ h.p. single-cylinder machine fitted with a three-speed and free engine hub of one of the best makers for sidecar work. My average mileage is 1,000 per month, and I drive pretty hard, but I cannot say the gear has given me satisfaction.

Taking the points of criticism mentioned by Mr. Paskell (issue September 4th):

1. Unreliability. I once had to ride threequarters of the way from London to Oxford on second gear when in a hurry; and have repeatedly had trouble through the gears not "dropping" properly, though this is not due to wrong adjustment or insufficient oil.

2. Slowing the back wheel. I admit I have not noticed this appreciably, but I do know that since the fitting my bicycle skids (solo) more than previously,—especially in such greasy places as Manchester.

3. Difficulty in removing back wheel. Perhaps it does "only" take five minutes more to remove a three-speed wheel than an ordinary wheel. But an amateur can, I think, remove an ordinary back wheel in three minutes, whereas eight minutes is very different.

Reliability is essential to any mount of mine, as I am an Oxford undergraduate, and therefore have to be in by midnight. And it is not nice giving an account of oneself if one is late after hurrying back from Town!

My next machine will be either a cycle car for comfort, or a single-cylinder T.T. machine with no gears and no clutch. I find that driving with three gears (solo) makes one forget to obtain the "best" out of the machine; of that I am sure. This naturally spoils the engine. A 3½ h.p. single will climb any ordinary hill if driven properly.

"ERIC BRONSGRAVE."

Sir,—I was much interested in Mr. Ll. K. Jones's letter in your issue of September 4th with reference to hub gears. I purchased a 3½ h.p. three-speed Triumph six months ago, and since then have covered 5,000 miles, both solo and with a sidecar. During that time I have only adjusted the gears once and I have never had one moment's trouble. The clutch has never slipped, and the gears, which change noiselessly, always act effectively. My last journey was from Reading to Edinburgh and back, and on some of those short but steep hills round about Durham I found the Sturmey-Archer three-speed gear invaluable.

D. W. HENDERSON.

Sir,—I have been very interested and amused at some of the letters that have appeared recently in *The Motor Cycle* concerning hub and counter-shaft gears and transmission. For the past ten years I have been a strong advocate for plenty of power, belt drive of ample strength, single gear or hub speed gear both for solo and passenger work.

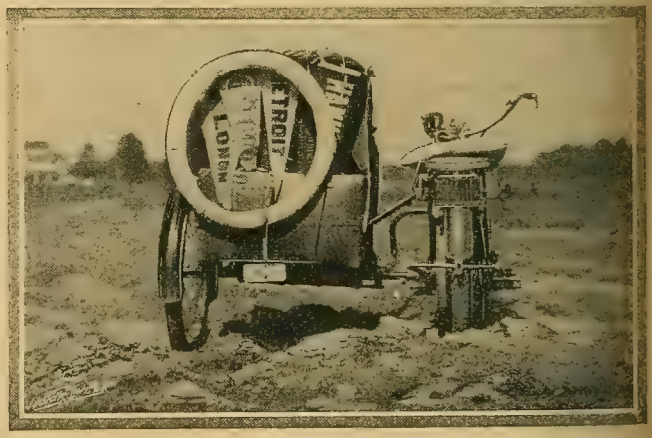
I have never had any serious trouble of any description. My present mount, a Regal-Green, fitted with large hub gear, to which is coupled a coachbuilt sidecar, with hood and screen often in use, gives the utmost satisfaction, and the drive is perfect. I should like to take this opportunity of congratulating the manufacturers of the Sturmey-Archer gear and the makers of the Pedley belt for producing such really good things.

The Green-Precision is an engine you can "set" at any speed you wish for hours on end, and I find both the above stand up to the heavy work exceedingly well.

I put the success I have had from the machine in general down to the fact that I told the makers what I required the machine to do before purchasing.

I have no connection with any of these firms except that I am a very satisfied client.

D. CHURCHILL WEIR.



A Triumph motor cycle and sidecar which was used for a thousand miles tour in Canada and U.S.A. Our photograph shows the description of road found between Detroit and Toledo. The sidecar is a Millford, and the combination came through without trouble, despite the bad roads and the quantity of luggage carried.

Sir,—I have noticed that a large amount of correspondence has taken place in your columns with regard to the respective merits of hub and counter-shaft gears.

I have long held the opinion, based on over twenty-five years' practical experience as an engineer, that the hub gear was preferable in every way. I have tested many forms, all with good results, and shall be glad if you will allow me space in which to say that for practical experience I have found the Rex adaptation of the Roc gear to give the best results in practice. On my 1912 Rex de Luxe I travelled 10,713 miles, and before parting with the machine, made an examination of the gear. I found that on the low gear there had been a slight wear, on the band brake only, which had resulted in the brake being tightened, only three turns of the adjusting nut. The teeth on the epicyclic showed no trace of wear beyond a slight polishing of the working faces. On the high gear side there was not the slightest trace of wear, and throughout the year's run no adjustment beyond that provided by the makers of the machine had been necessary. On my 1913 Rex Sidette, which has travelled, to date, a distance of 5,328 miles, no adjustment beyond an occasional tightening of the high gear adjusting screw has been necessary.

Perhaps I may be permitted space to add that in my opinion there is no gear at present on the market which is so suitable for the amateur driver as that fitted on the 1913 Rex machines. The high gear clutch does not slip, no matter how heavy the load or how steep the gradient, whilst the low gear permits one to crawl at the slowest possible pace through the thickest traffic without it being necessary at any time to stop the engine. I have no interest in the Rex motor cycle beyond that of a satisfied driver.

G. BASIL BARHAM, A.M.I.E.E.

Sir,—Having read the correspondence in your columns *re* gears, may I be allowed to give you my experience of a hub gear? The gear in question is a H. and B. (Hingston and Brown) marketed by the Service Company. I bought the gear at Whitsun, and within one hour of delivery it was running on the road, it fitting my 8 h.p. fixed gear Matchless without any trouble whatever; since then I have travelled over 4,000 miles, nearly always with my wife and two grown children (and always with sidecar and one passenger), and have had the happiest results from it, not having had the slightest trouble whatever with the gear. The internal working parts are simplicity itself, the wheel can be removed within three minutes of an ordinary driving wheel, it is pedal starting, the drive from standstill being as smooth as you could possibly imagine, and the change over from low to high being made without any fuss or shock. I suppose I must add the usual disclaimer. T. G. KIRBY.

What is a Freak Gear?

Sir,—For some time now an endeavour has been made to discourage the use of what the agitators have been pleased to designate "freak gears." I wish to protest against this, as, if persisted in, the policy may influence the development of motor cycles adversely, and I am particularly gratified to note that the judges' report of the A.C.U. trial makes reference to the subject.

All motor cycles, more especially sidecar machines, in addition to being able to surmount all hills on main and secondary roads, for which two speeds having a ratio of 1 to 1.5 suffice, require a third gear to fulfil two important functions—one to enable hills of 1 in 8 to 1 in 4 to be climbed and hills less steep, which for some reason or other cannot be taken fast enough to allow of the middle gear being used; and two, to allow of restarting on gradients as steep as 1 in 7.

To avoid the expense of a three-speed gear, some manufacturers provide two speeds having a ratio of 1 to 2, judging this to be sufficient for all purposes. My experience of this combination shows that if the top gear is correctly selected the second speed will not allow of gradients greater than 1 in 7 to be surmounted under adverse conditions, and 1 in 6 under favourable circumstances is the limit. As far as starting on a gradient is concerned, 1 in 10 is the steepest unless the clutch is capable of being slipped abnormally. Of course, if the machine be under-geared on top the climbing of steeper gradients may be made impossible, but the machine thus geared is unsuitable for ordinary work.

Proceeding to a consideration of three-speed gears, the average ratios adopted are 1, 1.5, and 2.25. In view of what I have stated above the range of usefulness of such a combination is but little greater than that of the two-speed gear with 100% drop on low gear. The intermediate speed is certainly an advantage, and, generally speaking, is low enough for most hills on secondary roads. When, however, the hills for which the middle gear is too high come to be considered, it will be found that 80% of them are too steep for the bottom gear. This is the point which so many makers lose sight of, but which is so important. A satisfactory three-speed gear for sidecar work should have ratios of 1, 1.6, and 3. Gear ratios of the order stated are, I maintain, neither freak nor abnormal, but absolutely necessary, and will be standard on all first-class sidecar machines in the near future.

I apologise for the length of this letter, but feel that the importance of the subject demands attention, and I think the opinions of experienced riders on this question would be of general interest. I am not connected with the trade in any way. H. M. STICH.

Consideration.

Sir,—Please allow us space to say a few words to "AA 1160" in reply to his letter in your last issue. We are the proud owners of the red stocking caps and tam o' shanters mentioned, and strongly resent any criticisms and insults by being publicly referred to by your correspondent. We do not wish to speak so much of the "noisy horde" mentioned, although it sounds very bad; it was but an ordinary hill-climb. We wish to refer to the sporting instinct of this "sufferer."

How can it be! If a true adherent to the cause he should have been too busy examining the machines and rejoicing in the sound of a healthy exhaust rather than full of abuse at the idea of people enjoying themselves. We cannot believe he is a sportsman, or he would not turn to ridicule and abuse the headgear we choose to wear. If an unhealthy mackintosh or leather cap, why not a red stocking cap or tam o' shanter, which lends a picturesque touch to such a sight as a dozen dusty, oil-stained motorists all in mackintosh overalls?

We are indeed sorry we did not meet with his approval, but we had no idea that there were such "killjoys" about.

While on the subject of exhausts, we should like to mention that the police here are extremely active, and warn any intending visitors, especially the long exhaust pipe brigade.

There were about sixty people at tea in the "quiet village" inn, where we know we were welcome.

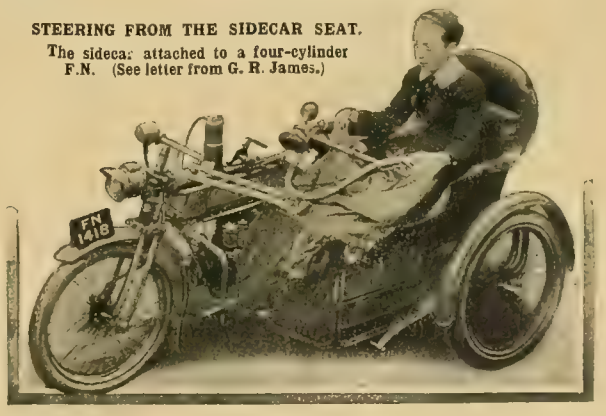
(Portsmouth and District Motor Club.)

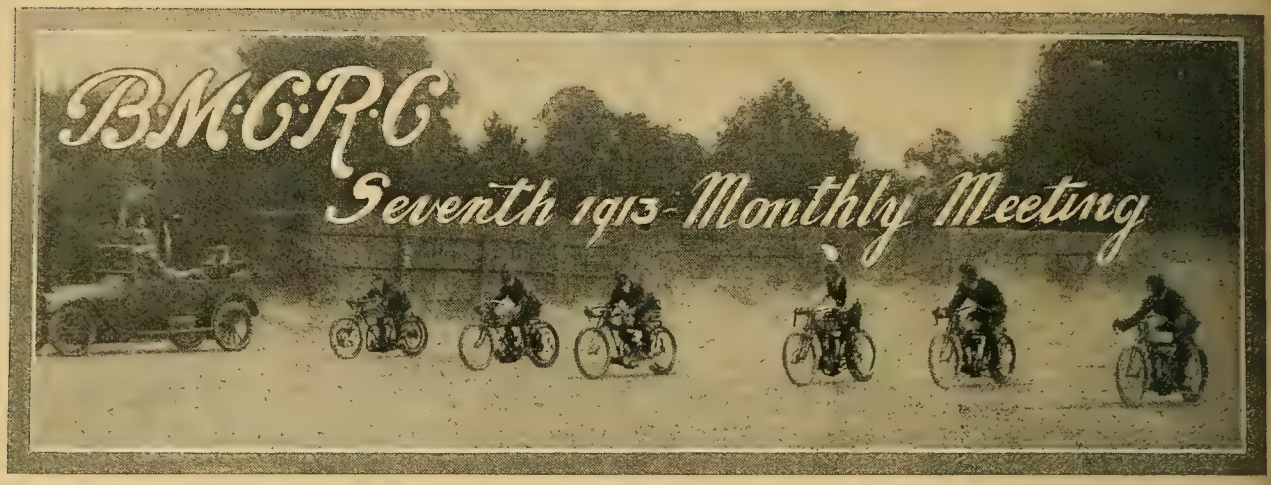
Driving from the Sidecar.

Sir,—In reference to Mr. F. Trafford's letter in *The Motor Cycle* of September 4th, I think that perhaps the enclosed photographs would interest you and others. I find this attachment very satisfactory, and it certainly meets a long-



STEERING FROM THE SIDECAR SEAT.
The sidecar attached to a four-cylinder F.N. (See letter from G. R. James.)

felt want. The device can be attached or detached in less than one minute, and no alteration is necessary in the controls or any other part of the mechanism. I have applied for a patent. G. R. JAMES.



Nearing the starting line in the 500 c.c. sprint race. G. E. Stanley ultimately proved to be the winner on his 3½ h.p. Singer.

THE B.M.C.R.C. was favoured with glorious weather for its September meeting, though a strong south-westerly wind was blowing against the competitors down the railway straight. The time trials, which formed the first event in the programme, were begun at 11.30 a.m. The competitors were started at the fork by Mr. A. V. Ebblewhite and were timed electrically over the measured kilometre and mile in the railway straight by Major Lloyd. The results were as follows:

Kilometre and Mile Speed Trials.

CLASS B.

	Times. Kilo. secs.	Mile. secs.	m.p.h.
1. G. E. Stanley (1-cyl. Singer, 349 c.c.)	34.8	56.6	63.60
2. J. P. le Grand (1 Singer, 348) ...	39	63.0	57.14
3. S. E. Elwell (2 Douglas, 350) ...	40.8	66.4	54.22

CLASS C.

1. G. E. Stanley (1-cyl. Singer, 499 c.c.)	31.2	51.6	69.77
2. L. Hill (1 Rudge, 499)	32.6	53.2	67.67
3. D. R. O'Donovan (1 Norton, 490) ...	33.2	53.8	66.91
4. F. W. Carryer (1 Imperial, 493) ...	36	58.8	61.22

CLASS D.

1. W. G. Howard (2-cyl Matchless, 744 c.c.)	32.2	52.6	68.44

CLASS E.

1. E. C. E. Baragwanath (2-cyl. Matchless, 986 c.c.)	29	46.8	76.92
2. E. Remington (2 Matchless, 986) ...	30	49	75.47
3. S. George (2 Indian, 994)	30.4	49.2	73.17
4. W. G. Howard (2 Matchless, 986) ...	33	52.4	68.70
5. O. M. Baldwin (2 Matchless, 986) ...	32.6	52.6	68.44

CLASS C.—Sidecars.

1. K. Holden (1-cyl. B.S.A., 499 c.c.) ...	43.6	69.6	51.72
2. J. Cocker (1 Singer, 499)	43.8	70.0	51.43
3. S. F. Garrett (1 Zenith-Green-Precision, 499)	45.8	73.2	49.18
H. C. Mills (1 Zenith-Green-Precision, 499)	52.8	84.6	42.55

CLASS D.—Sidecars.

1. E. B. Ware (2-cyl. Zenith, 748 c.c.)	48.2	70.0	51.43
2. F. W. Barnes (2 Zenith, 748) ...	37	70.6	50.99
3. G. T. Gray (1 Rudge, 750)	47.8	77.0	46.75

CLASS E.—Sidecars.

F. W. Barnes (2-cyl. Zenith, 986 c.c.)	37.0	60.0	60.0

CYCLE CARS.

1. B. H. Haywood (4-cyl. Singer, 1,096 c.c.)	31.18	50.87	71.18
2. G. W. Hands (4 Calthorpe, 1,088) ...	35.4	56.2	64.06
3. C. F. Halsall (4 Wilton, 1,072) ...	41	67.2	53.57

Haywood's wonderful performance resulted in his handsomely beating his own record which he accomplished on 17th May last, when he covered the flying kilometre in 33.64s. (66.50 m.p.h.) and the mile in 54.67s. (65.85 m.p.h.). In attempting record all the competitors had to keep outside the fifty foot line, as the timing tapes did not exceed this width. Some of the sidecar racing bodies were weird and wonderful contraptions, notably Ware's, which was labelled the "Earwig," and was built absolutely to fit the passenger. Cocker's sidecar chassis was fitted with vertical enclosed springs.

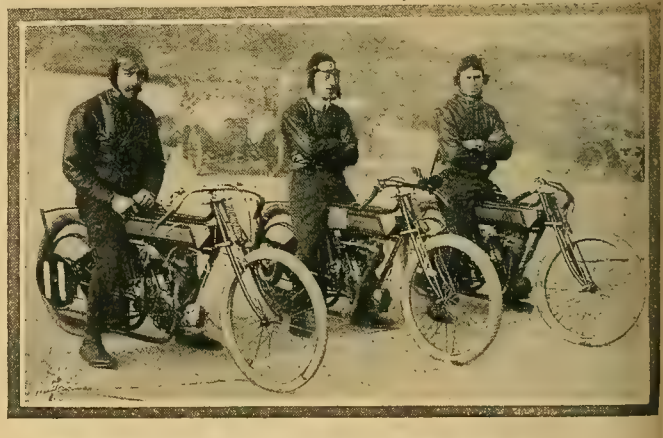
One Lap Sprint Races.

Events 2, 3, and 4 were one lap sprint races, which were run in the following manner. The competitors started about a quarter of a mile from the starting point, accompanied by the official car, driven by Major Lloyd and carrying Mr. Ebblewhite the starter. Near the timekeeper's box they formed into line, and at the dropping of the flag sprinted ahead. On two occasions we watched the start, through the courtesy of Major Lloyd, from the car, and very impressive it was.

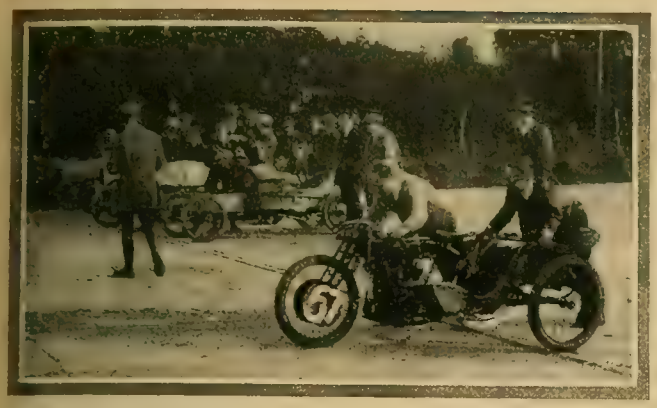
Event 2, for Classes A and B, resulted in an easy win for Stanley.

	m. s.
1. G. E. Stanley (1-cyl. Singer, 349 c.c.)	2 41
2. V. Busby (1 Sunbeam, 346)	2 48⅕
3. W. A. Jacobs (1 Singer, 348)	2 48⅖
4. J. P. Le Grand (1 Singer, 348).	
5. H. Greaves (2 Enfield, 350).	
6. E. E. Elwell (2 Douglas, 350).	
7. H. V. Colver (2 Enfield, 350).	
8. A. Holzapfel (1 Regal-Green-Precision, 347).	
9. D. Iron (2 Enfield, 350).	

The winner's speed was 60.77 m.p.h.



The winning Enfield team in the Senior One Hour Team Race. From left to right the riders are H. V. Colver, H. Greaves, and D. Iron.



Start of the ten miles record race, showing G. Griffith (8 h.p. Zenith sidecar) in the foreground, and the cycle cars in the background.

Event 3 was for Class C up to 500 c.c.

Holden was first away, but O'Donovan hung back, though, curiously enough, these two finished second in a dead-heat. Result :

		m.	s.
1.	G. E. Stanley (1-cyl. Singer, 499 c.c.)	2	42⅖
2.	D. R. O'Donovan (1 Norton, 490)	2	33
2.	K. Holden (1 B.S.A., 499)	2	33
4.	R. B. Ewens (1 Rudge, 499).		
5.	F. W. Carryer (1 Imperial, 493).		
6.	W. D. Hawkes (1 Ixion-Precision, 499).		
7.	C. G. Pullin (1 Rudge, 499).		

The winner's speed was 67.75 m.p.h.

O'Donovan and Holden settled their dead heat near the close of the meeting in a separate match, which resulted in a close race and a win for the former.

Event 4 was for Classes D and E. Wallace (Grandex) was in trouble at the start, and had difficulty in getting away. This moved Major Lloyd to compassion, so he went back to the fork and brought seven sturdy men to act as starters. The B.A.R.C. Sizaire had therefore to return with ten up. At the finish Hoare (C and H. Jap) cut right across the bank in front of those following him and drew close into the barrier before one realised that his front tyre had come off and that he had cleverly recovered himself. Result :

		m.	s.
1.	C. B. Franklin (2-cyl. Indian, 994 c.c.)	2	16
2.	E. Remington (2 Matchless, 986)	2	18
3.	O. M. Baldwin (2 Matchless, 986)	2	26
4.	W. H. Howard (2 Matchless, 986).		

Winner's speed, 71.94 m.p.h.

Senior One Hour Team Race.

Event 5 was the Senior One Hour Team Race, open to teams of three motor cycles of any one make, not exceeding 1,000 c.c. ; the winning team was to be the one riding the greatest aggregate distance in the hour.

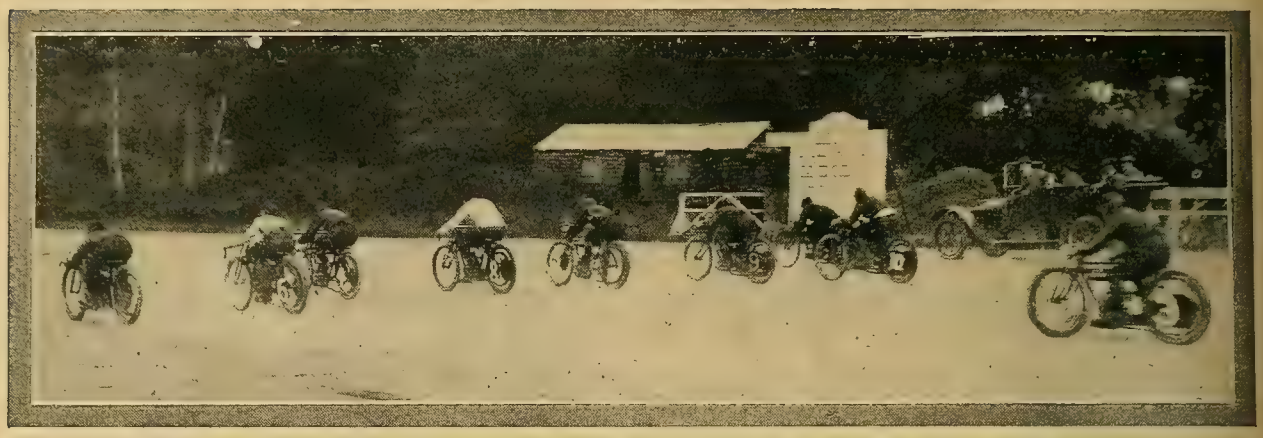
This race was chiefly noteworthy for the consistent riding of Franklin, who led throughout, and kept up a splendid average, and also the reliability of the Enfields, the smallest machines entered, which made their best performance of the season in this event. Of the Indians, Hill was soon out of the running owing to the pulling out of a chain bolt. Manners-Smith had trouble early, got going again, and started later, but retired after completing seven laps. Hill (Rudge) and the other Rudge riders stopped several times to change their belts. Franklin shed his exhaust pipe in his nineteenth lap, and Greaves lost a footrest in his seventeenth lap. The result was as follows :

		mls.	yds.
1.	H. Greaves (2-cyl. Enfield, 350 c.c.)	55	1,579
	D. Ison (2 Enfield, 350)	54	590
	H. V. Colver (2 Enfield, 350)	45	275
	Total	155	684
2.	C. B. Franklin (2-cyl. Indian, 494 c.c.) ...	67	926
	S. George (1 Indian, 497)	57	38
	B. A. Hill (1 Indian, 497)	5	766
	Total	129	1,730
3.	R. B. Ewens (1-cyl. Rudge, 499 c.c.)	52	1,582
	L. Hill (1 Rudge, 499)	51	162
	C. G. Pullin (1 Rudge, 499)	16	539
	Total	120	523
4.	R. Fenn (1-cyl. Triumph, 499 c.c.)	62	1,109
	W. Edmondson (1 Triumph, 499)	24	808
	J. A. Manners-Smith (1 Triumph, 499) ...	19	42
	Total	106	199

Sidecar Relay Race.

The Sidecar Four-lap Relay Race was for teams of two machines, one of each had to be fitted with an engine not exceeding 500 c.c. The laps were ridden alternately by each partner, whose passenger on the machine, stopping on the finishing line, handed a coloured scarf to his partner's passenger, whose machine started away at once. We noticed on Barnes's Zenith two special carburetters fitted to a special inlet pipe. These carburetters took air through Venturi tubes, which were capable of being closed by shutters when rapid acceleration was desired. At the start Mills broke his belt, and at the end of the first lap Garrett

Competitors lined up for the sidecar relay race which was won by F. W. Barnes (8 h.p. Zenith) and S. F. Garrett (3½ h.p. Green Precision).



Start of the 500 c.c. sprint race G. E. Stanley (3½ h.p. Singer), who, as usual, was very conspicuous amongst the winners, is seen lying last.

came in first and Sumner shot over the line. Barnes was first away. In the second lap Griffith was first in and Mills first away. Garrett stopped short of the line and had to push in. Ware got away in excellent form. Barnes was the first man home by a quarter of a mile, with Ware second. Mills did not finish. Result: Barnes and Garrett, 1; Sumner and Ware, 2. All rode Zeniths except Garrett, who, of course, rode a Green-Precision.

Singer Cycle Car's Fine Performance.

In the ten mile record race and sealed handicap, open to sidecars and cycle cars, the order of the first three never altered throughout the event. The Singer cycle car again distinguished itself, and was the only machine on Saturday to gain two records. The result was as follows:

Time.

	m. s.	m.p.h.
1. B. Haywood (4-cyl. Singer, 1,096 c.c.) ...	8 39⅖	69.31
2. F. W. Barnes (2 Zenith sc., 986) ...	10 21⅕	57.95
3. G. W. Hands (4 Calthorpe, 1,088) ...	10 40	
4. E. B. Ware (2 Zenith sc., 748)	10 54⅘	
5. C. F. Halsall (4 Wilton, 1,072)	10 56⅕	

Handicap.

	Start. m. s.	m. s.
1. B. Haywood (4-cyl. Singer, 1,096 c.c.) ...	scr.	8 39⅖
2. S. F. Garrett (1 Regal-Green-Precision sc., 499)	2 6	9 31⅗
3. J. Cocker (1 Singer sc., 499)	1 52	9 45⅕
4. E. B. Ware (2 Zenith sc., 748)	1 7	9 47⅖

The following records were established:

CYCLECAR CLASS.

B. Haywood (Singer) ... ... 8m. 39⅖s. ... 69.31 m.p.h.

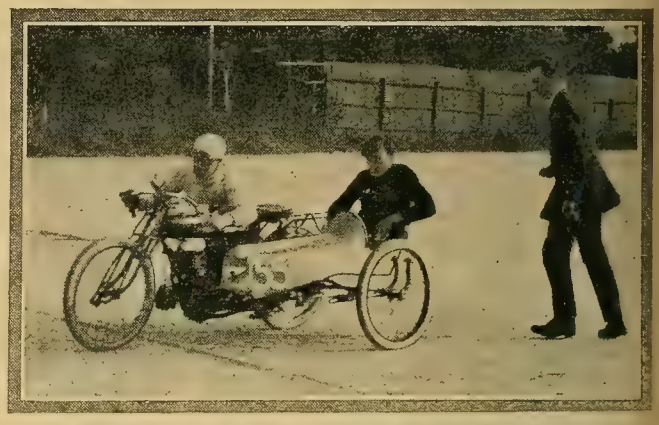
SIDECARS.

F. W. Barnes (Zenith) 10m. 21⅕s. 57.95 m.p.h. Class E.
B. Ware (Zenith) ... 10m. 54⅘s. 54.97 m.p.h. Class D.
J. Cocker (Singer) ... 11m. 37s. 51.65 m.p.h. Class C.

The final event of the meeting was the Press Handicap, distance two laps, which resulted in a triumph for *The Motor Cycle*. The first lap order was as follows: Osmond, Stough, Davis, Wallis, Hardy, and Richardson, and the result was a comfortable win for Wallis, with Osmond a good second.

	Start.	m.p.h.
1. C. E. Wallis, *The Motor Cycle* (1-cyl. Triumph, 499 c.c.)	1m. 30s.	52.05
2. D. Osmond, *The Motor Cycle* (2 Douglas, 350)	0m. 56s.	
3. O. T. Stough, *The Auto Cycle* (2 Enfield, 350)	1m. 39s.	
S. E. K. Richardson, *News Illus.*, Ltd. (1 Rudge, 499)	0m. 56s.	
F. A. Hardy (2 Douglas, 349)	1m. 20s.	

It is interesting to note that in the Neill Cup register to date Stanley heads the list with 254 marks, Mason is second with 124 marks, and Barnes third with 119 marks.



E. B. Ware (8 h.p. Zenith) starting in the sidecar relay race. This rider was first in Class D Time Trials.

CLUB COMPETITIONS IN YORKSHIRE.

Bradford M.C.C.

The second speed trials were held recently, and were run on handicap. Results:

Solo Class for the Roland Winn Trophy (awarded outright).
1. F. Doodson (3½ Elswick-Precision) 61.855 m.p.h.
2. S. Todd (3½ P. and M.) ... ... 55.045 ,,
3. D. Watson (6 Enfield) ... ... 58,841 ,,

Gold medal for fastest time of the day (solo) was awarded to Tim Wood (3⅜ Scott), 63,257 m.p.h.

Sidecar Class for the Briggs Cup (to be held for one year) and club standard gold medal.
1. W. Gilyard (8 Chater-Lea) ... 50.847 m.p.h.
2. P. Bentley (3½ P. and M)
3. C. Hart (3½ Rudge)

Palatine tyre for best performance by a private owner riding the same machine in both classes, F. Doodson (3½ Elswick-Precision).

Harrogate and District M.C.C.

The paperchase held on the 9th inst. proved a very enjoyable and interesting event, and was fairly well supported. Messrs. Grange and Nettleton on Bradbury and New-Hudson sidecars respectively were the hares, and were run to ground on the time limit after a most strenuous forty miles moorland course by E. Maynard (3½ three-speed Triumph), the only hound to complete the proper course, a long false trail at the finish proving the undoing of practically the whole of the competitors. The event finished at the top of an almost impossible hill called The Scar, which is situate between the Angram reservoir and Middlesmoor in Nidderdale.

Two Sidecar Attachments.

MESSRS. ROBERTSONS, of 157, Great Portland Street, W., are agents for the Viceroy sidecar, which we illustrate herewith. It is a particularly well-designed attachment, fitted with a body, the lines of which are very pleasing. Behind the seat there is ample room for luggage and spares.

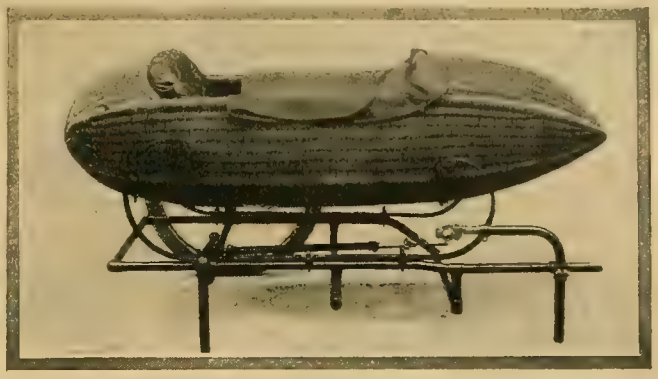
Messrs. Robertsons, who are also agents for the Henderson motor bicycle, inform us that it has been said that this machine, owing to its long wheelbase, is difficult to turn in a short space. We recently had an opportunity of seeing Mr. Robertson-Brown ride one of these machines with clutch in engagement and turn in a remarkably short space, the engine meantime running very slowly and firing with absolute regularity.

Another sidecar we recently examined, at Messrs. Reys, Great Portland Street, W., is the Swan. This attachment looked particularly attractive and comfortable. Strength, lightness, and simplicity of construction are claimed by the makers.

The suspension of the body is by means of two coiled springs fore and two aft.

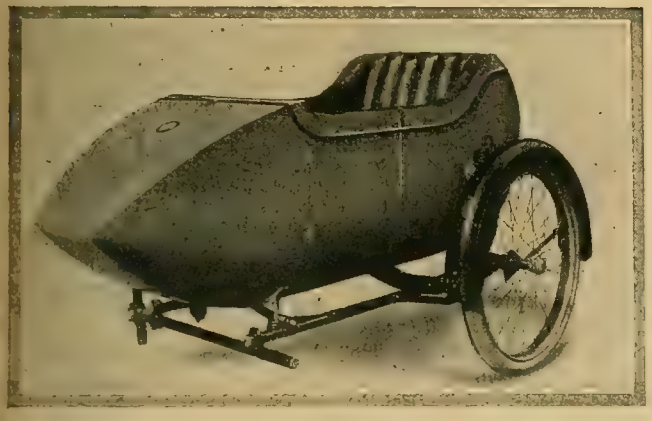
The chassis is of weldless steel tubing, some of which is of square section and specially strengthened. The wheel, with 26 × 2¼ tyre, has a nickel-plated rim with black centre and red lines.

The body, which is coachbuilt, is luxuriously upholstered and finished in grey. Pockets are fitted, and there is a cupboard under the seat. There is plenty of leg room, and the passenger is enabled to sit quite upright.



The Viceroy sidecar which is sold by Robertsons, Ltd. Ample room is provided behind the seat for luggage and spares.

Essex M.C. Annual 24 Hours Run.



The Swan sidecar, sold by Rey's Ltd., the body of which is sprung fore and aft by means of coiled springs.

The following is a complete list of the awards in the Woodford to York and Back Run, an illustrated description of which was published in the issue of September 4th :

GOLD MEDAL WINNERS.

Rider and machine.	Time error.
W. W. Webster (3½ Rudge)	10m. 8s.
L. G. Brown (3½ Corah-Jap)	10m. 12s.
A. C. Stephens (3½ Triumph)	9m. 42s.
H. R. Whitmore (3½ Rover)	9m. 4s.
R. G. Mundy (3½ T.T. Triumph) ...	4m. 19s.
H. J. Beal (4 L.M.C.)	6m. 54s.
G. T. Gray (5 Rudge)	4m. 4s.
Miss Berend (7 Indian sc.)	3m. 59s.
A. E. Brassington (6 Rex sc.)	8m. 3s.
F. L. Cook (4½ Calthorpe sc.)	9m. 32s.
A. E. Uffleman (8 Chater-Lea sc.) ...	4m. 50s.
K. A. MacDonald (3½ Singer sc.) ...	8m. 19s.
J. Chater-Lea (8 Chater-Lea cc.) ...	9m. 31s.

SILVER MEDAL WINNERS.

C. Pearson (2¾ Douglas)	15m. 28s.
F. Roberts (3½ Singer)	11m. 50s.
S. Tharp (3½ Triumph)	11m. 48s.
A. G. Peppercorn (3½ Bradbury)	24m. 35s.
B. A. Hill (7 Indian sc.)	12m. 49s.
W. C. Hemy (6 Clyno sc.)	11m. 7s.
J. H. Kerr (3½ N.S.U. sc.)	14m. 28s.
V. Garland (8 Williamson sc.)	19m. 0s.
A. Miller (6 Zenith sc.)	14m. 15s.
A. B. Phillips (8 Warne cc.)	16m. 43s.

BRONZE MEDAL WINNERS.

A. G. Cocks (2½ Connaught)	93m. 45s.
Miss Baxter (2½ Connaught)	85m. 57s.
F. H. Worley (6 Matchless sc.)	70m. 35s.
A. T. Stanton (3½ Bradbury sc.)	35m. 51s.
A. H. Gold (8 Williamson sc.)	218m. 8s.
L. Cass (6 Trump sc.)	70m. 38s.

SPECIAL PRIZES.

Triumph Silver Challenge Cup, for the best performance on motor cycle or passenger motor cycle.—Miss Berend.

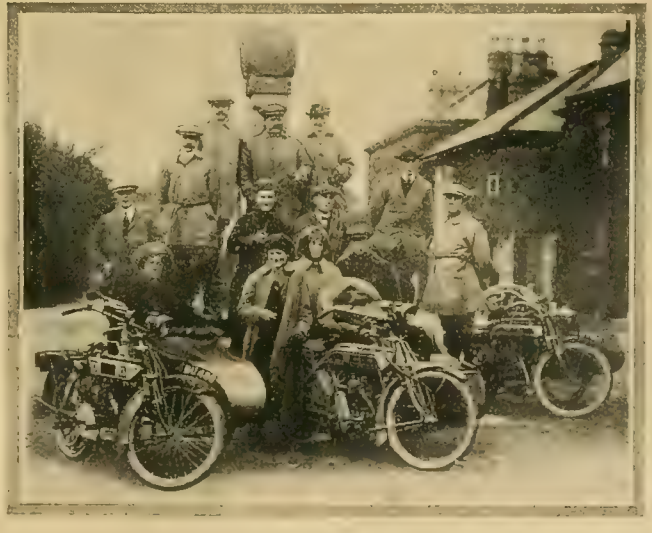
Set of three tyres, presented by the Victor Tyre Co., for best sidecar performance by a private owner.—Miss Berend.

Gold bracelet for best lady's performance.—Miss Berend.

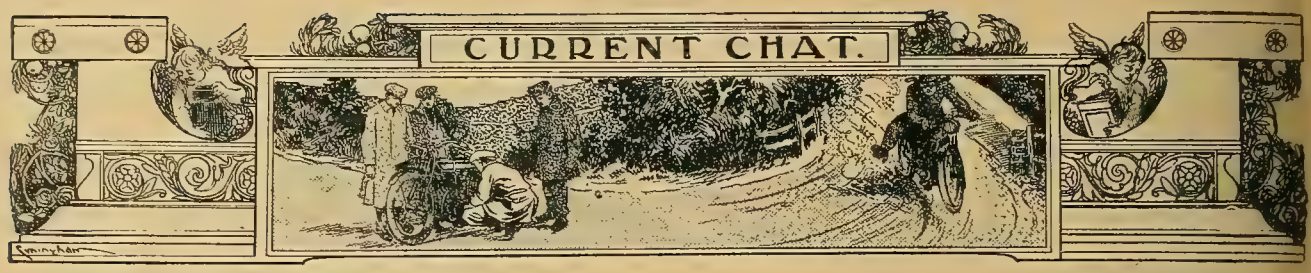
Gold medal, presented by the Hendee Co., for best solo performance by a private owner.—H. R. Whitmore.

Tyre, presented by the Palatine Tyre Co., for second best solo performance by a private owner.—A. C. Stephens.

Silver cup, presented by Mr. A. R. Abbott, for the best performance on a cycle car.—J. Chater-Lea.



Competitors in one of the Harrogate and District M.C.C. paper chases, grouped by the old stone cross at Ripley, the scene of the start.



TIME TO LIGHT LAMPS.

September	18	...	7.8
,,	20	...	7.3
,,	22	...	6.59
,,	24	...	6.54

Sutton Coldfield Trial—Prize for Teams.

Special prizes for teams of three have been presented by Messrs. Collier and Sons, Ltd., Matchless Works, Woolwich. Any three riders may combine to form a team, no matter what machines they ride. The prize will be awarded to the team making the best aggregate performance throughout the trial.

A North Country Meet.

A party of North-country motor cyclists to the number of fifty met at Aberdeen last week and took part in a hundred miles tour through some of the beauty spots of the county. Twenty were accompanied by lady passengers in sidecars, the remainder rode solo machines. The whole party was mounted on Rudges, and a very enjoyable time was spent.

The Gaillon Hill Climb.

This popular event, which takes place in France on the hill of Sainte Barbe, near Gaillon, will be held on October 5th. Gaillon is most accessible from either Dieppe or Havre, and consequently is easily reached by English competitors. The hill is perfectly straight, and has a gradient no worse than 1 in 10. The usual classes, up to 250 c.c., 350 c.c. and 500 c.c. for motor bicycles, and up to 350 c.c., 500 c.c., and 1,000 c.c. for cycle cars and sidecars, have been instituted. The entry for solo machines costs 10 frs., for sidecar combinations or cycle cars 20 frs. The cost of getting over is comparatively moderate, and it is therefore anticipated that there will be a good English entry. Entries should be addressed to *L'Auto*, 10, Rue du Faubourg-Montmartre, Paris.

Coventry's New Mayor.

Councillor S. Bettmann, one of the managing directors of the Triumph Cycle Co., Ltd., has been offered and has accepted the office of Mayor of Coventry for next year. Mr. Bettmann with his co-managing director Mr. M. J. Schulte started the business of the Triumph Co. in Coventry in 1890, and had previous to that date been in the cycle business in London, trading as S. Bettmann and Co. Mr. Bettmann is a vice-president of the Motor Cycle Manufacturers' Union, a member of the Council of the Society of Motor Manufacturers, and chairman of the Standard Motor Co., the makers of the Standard small car, particulars of which have been published in these pages.

Road Warnings.

Glasgow-Stirling Road at Millerston, Stepps, Cumbernauld and Denny.

A Novel Mascot.

G. K. Pippett, an enthusiastic rider of a 3½ h.p. Singer, carries a novel mascot on his machine. Recently he ran over a rat in the dark, picked it up and took it home. After having the skin dressed he is using it both as a mascot and a horn bulb cover.

Edinburgh M.C.C. Open Hill-climb.

The above event, which was announced to take place on Amulree on Monday last, has been indefinitely postponed. This is said to be partly due to the unfortunate accident which occurred to Mr. McGregor, the hon. secretary, and which was reported in these columns last week, and the difficulty of obtaining an efficient substitute.

Italian Motor Cycle Championships.

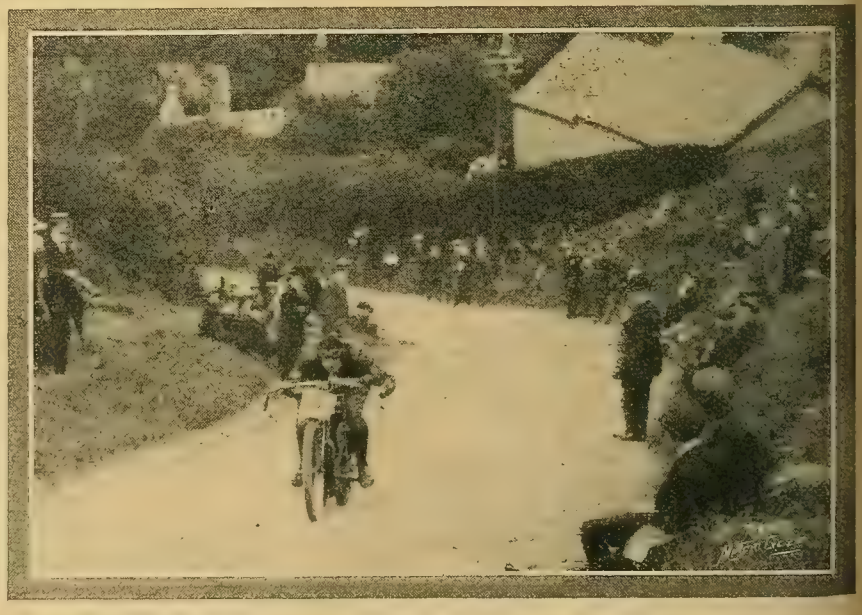
We have received particulars of the Circuito di Cremona, which was run off on the 7th September, and the winning of which in each section carries with it the title of champion of Italy in that particular class. The three classes were divided up for 250 c.c., 350 c.c., and 500 c.c. machines. Last year, it will be remembered, the 500 c.c. class was won by S. A. Rowlandson, on a Rudge. This year the distance was 196 miles, being five laps of about 39 miles 350 yards. England, France, Germany, Switzerland, and Italy were represented, thus quite an international flavour was imparted to the event. Among the riders were Ravelli and Vailati, who rode in this year's T.T., and a lady, Signorina Vittorina Sambri, who rode a Terrot, but unfortunately had to retire during the first lap. However, a Terrot won the little 200 c.c. class. Among the 350 c.c. machines Miro Maffeis gained a fine win on a 2¾ h.p. Douglas, these machines also obtaining fifth, seventh, and eighth places. The winner of this section averaged 45 m.p.h. In the 500 c.c. category, Carlo Maffeis won on a Moto Rêve, covering the course at an average speed of 53 m.p.h. This was considered a very remarkable feat, as undoubtedly it is, for it beats Rowlandson's time last year. The winners are brothers. A good many accidents occurred, but luckily none of them were serious. The lady rider created a good deal of interest, but unfortunately her machine caught fire soon after the start, so it was impossible to judge of her abilities as a *chauffeuse*.

SPECIAL FEATURES:

ACROSS FRANCE TO BELGIUM AND THE ARDENNES.

SOME 1914 MODELS.

FUTURE OF LONG DISTANCE TRIALS.



At the top bend of Pen-y-ball. A. J. Moffatt (5 h.p. Zenith) who made fastest time in Class "H".

A.C.U. Notes.

The Auto Cycle Union have issued 1,076 competitors' licences between January 1st and the present date.

The Exeter to Okehampton main road near the fourth milestone from Exeter is now being reconstructed. Motorists are recommended to travel *viâ* Dunsford and Moretonhampstead to avoid inconvenience.

A.C.U. One-day Trial.

As mentioned in our issue of September 11th, the A.C.U. one day trial, which was down to take place on September 24th, has been postponed. It is now proposed to hold a one day trial in its place on October 29th, open to cycle cars, when the course followed will be much the same as that used for the A.C.U. one day spring trial this year.

R.I.A. Improvements.

The Lancashire and Cheshire Branch of the R.I.A. is enquiring into the dangerous state of many of the canal bridges in the two above-mentioned counties. In many instances these bridges do not follow the direction of the roadways, but are at right angles, the approaching roads frequently joining the canal at an angle of 45°.

Motor Cycle Alpine Trial.

Madame Picaud, who rode as passenger with her son on a 5-6 h.p. Clyno sidecar in the Marseilles-Lyons Trial, has sent us an interesting account of this competition. The route traversed five Alpine passes, and at times reached an altitude of 7,200 feet above sea level. Among the passes climbed were the Col d'Allos (6,750 feet) and Col de Vars (6,375 feet). In one of the narrow streets of a village the Clyno met one of the "Cars Alpine" motor chars-à-bancs. There being no room to pass, the sidecar had to be pushed to one side with the sidecar wheel right on the bank. On the second day the Col d'Izoard (7,200 feet) was traversed, which is a new road only opened a fortnight ago. Many solo riders had to dismount and run alongside their machines, but both Frank Smith's and M. Picaud's Clynos climbed to the summit. The road then went *via* Briançon, the Lauteret (a long climb), La Grave, from which there are magnificent views, and the Sappey Pass. The trial finished with only nine survivors, and of these the Clyno was awarded a special prize for the best designed touring machine.

A.A. and M.U. Notes.

FLOODED ROADS.—The Association has made arrangements for erecting signs when the floods are out in the neighbourhood of Chertsey Lane in the wintry season.

HIGH SPEED AT SANDGATE.—The Sandgate Urban District Council has recently given serious consideration to the question of putting forward an application for a ten miles per hour speed limit through Sandgate, but it is decided, before making such an application,, to ask the Association to notify members of the great danger arising from fast motor traffic to children crossing from the houses to the beach, in the belief that this is not fully realised by drivers. Will motorists, therefore, make a point of driving very carefully along this particular stretch of road?

FUTURE EVENTS

Sept.	19-20.	Birmingham M.C.C. Open Trial to Carlisle and Back.
„	20.	Streatham M.C.C. Open Speed Trials at Brighton.
„	27.	Liverpool A.C.C. Open Reliability Trial.
Oct.	3.	Sutton Coldfield and Mid-Warwickshire A.C. Open Trial.
„	4.	B.A.R.C. Brooklands Meeting.
„	4.	Bristol M.C.C. Open Speed Trials.
„	11.	Coventry & Warwickshire M.C. Annual Open Hill-climb.
„	11.	B.M.C.R.C. Meeting and A.C.U. Championships.

List of "Expert" Riders.

Up-to-date the A.C.U. list of "expert" riders had reached a total of seventy-two. A list of these riders will be supplied to any secretary of a club affiliated to the A.C.U. if application be made to the secretary of the A.C.U., 89, Pall Mall, S.W.

Lubrication.

As the question of motor cycle lubrication is not by any means settled, it would be interesting to hear if any one has tried the Bosch Company's force feed lubricator, a description and illustration of which were published in *The Motor Cycle* of November 21st, 1912.

A.C.U. Championship Meeting.

The Auto Cycle Union will hold the motor cycle racing meeting for the A.C.U. championships at Brooklands on 11th October, starting at 11 o'clock. The first event to be run off will be a one-hour race for cycle cars and sidecars, and after lunch the Senior one-hour race and the Junior one-hour race, and a five laps race for motor cycles of 1,000 c.c. will be decided.

The Coventry and Warwickshire M.C. Hill-climb.

Mr. Fred Spencer, the hon. sec. for this hill-climb, informs us that a very large number of enquiries have been received from private riders for entry forms. There is every indication that the entries will constitute a record, and prove that this climb is looked upon as something of a "classic." The location of the hill will be kept a secret till the last moment.

Police Activity in North London.

A good deal of trapping is taking place in North London. In Bounds Green Road, for half a mile from the Jolly Butchers Hill proceeding from London a trap is being worked, while between the Promenade and the Green Dragon at Winchmore Hill there is a permanent trap, where no less than five policemen were recently on duty at the same time.

Should Lighting-up Time be Earlier.

A good deal of attention has lately been paid by the lay press to this question. As everyone knows, the official time for lighting-up is one hour after sunset, but it is felt in many quarters that it would be far safer if the time was advanced somewhat. In France lamps must be lit at the hour of sunset. We ourselves have sometimes been surprised to find that we have had another quarter of an hour or so before we need legally light up on several occasions, so dark was the evening. A good deal depends on the sort of weather experienced as to whether it is dangerous to wait till the legal hour, as in this variable climate of ours evenings vary so much in darkness. Of course, it may be argued that if it is too dark to ride in perfect safety though not yet lighting-up time, the careful motor cyclist would light his lamp, but most riders do not care to use up their carbide for a possibly quite short run unless necessary.

A scene in one of the depots during the Italian road race on the Cremona circuit. Our correspondent says great confusion occurs in the depots at all Italian races. The machine in the background is a Douglas, one of which finished first in its class.

A STRANGE EXPERIENCE.

A CORRESPONDENT recently queried us regarding the bad running of a single-cylinder water-cooled engine which he was using on a cycle car. The symptoms were that on level ground and downhill (if the engine were suddenly accelerated by opening the throttle) misfiring and bad running occurred if the throttle were opened more than half way; but if a hill were met, all signs of bad running disappeared, and the engine pulled extremely well and without any sign of misfiring. The symptoms pointed to the fact that the carburetter was badly adjusted, and that either too rich or too weak a mixture occurred beyond half throttle. Lowering of the compression, a new magneto, and three different types of carburetters had been tried, as well as numerous adjustments, and our advice was to try a Bowden-operated air valve on the inlet pipe. Finally, when the owner had practically exhausted his patience, he was advised by the makers of the machine to fit a spark gap. The owner then recollected that almost immediately after his arrival home from London (he resides in a northern town) he had noticed the spark gap which was originally fitted had been broken and removed, and in searching for the cause of the bad running it was overlooked that a spark gap had once been fitted. However, another spark gap was fitted, and this has certainly been coincident with the stoppage of the bad running.

The Function of a Spark Gap.

One is not accustomed nowadays to see outside spark gaps on motor cycles, although their use at one time was fairly general. On modern machines, however, they have practically disappeared, and it is quite a rarity to see one on either motor cycle or car. Our correspondent thinks that the reason why the spark gap causes better running is that the magneto on the single-cylinder engine in question is driven at engine speed, two sparks occurring during each of the four cycles, one spark taking place in "dead" gas, and that this causes the sparking plug points to become incandescent, and thus brings about premature ignition. His theory is that the spark gap reduces the intensity of the current, so preventing the points becoming incandescent. This cannot be a correct explanation of the phenomenon, as a spark gap, if anything, intensifies the spark.

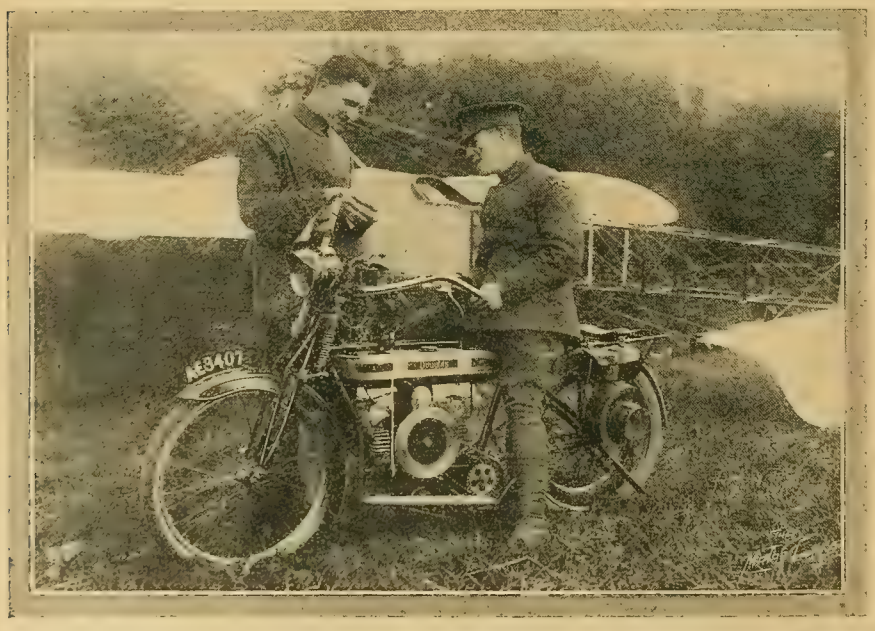
However, we think the experience is one of sufficient interest to warrant a special mention, because we cannot remember having ever heard of an engine being improved in running by the fitting of a spark gap. Spark gaps are usually tried to overcome the tendency of oily plugs to short-circuit, the spark gap causing any oily deposit to be burnt off as it is formed. Also, if it be already formed, the fitting of a spark gap, or even holding the high tension wire near enough to the sparking plug terminal to enable a spark to jump from the end of the terminal and so on to the plug, will often break down or destroy any bridge of oil which has connected the plug points.

Motor cyclists who possess engines which are prone to misfire and generally run badly if pushed beyond a certain speed may find that by fitting a spark gap they will overcome their trouble, but it is not necessary to experiment with spark gaps on modern machines, and particularly those which have the magneto running at half the engine speed, which is the usual method employed.

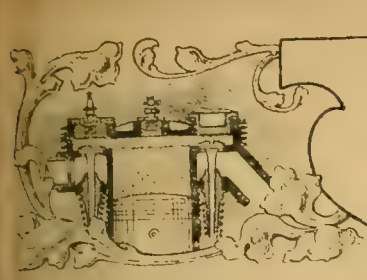
We submitted the above to Messrs. Lodge Bros. and Co., Birmingham, who say that the explanation of the bad running when the spark gap is not fitted is due to pre-ignition, caused by a spark in the cylinder at the wrong time. As the single-cylinder magneto is geared to run at crankshaft speed, there is the normal spark in the compressed gas, and a useless spark at the end of the exhaust stroke; that is to say, there is a spark each time the piston is at the top of its stroke. The magneto could also give a spark each time the piston arrives at the bottom of its stroke. There is an impulse in the position, but no cam to open the contact points. At high speed, however, the magneto would give a very small spark, even without the platinum points being opened. One of these small sparks would occur when the cylinder had just drawn its full charge. A small spark gap in series with the plug would be quite sufficient to stop this small spark occurring; probably increasing the gap of the sparking plug would have the same effect, but might make the starting more difficult.

It is possible that this stray spark is intensified by the contact points vibrating at the time that the impulse occurs in the magneto.

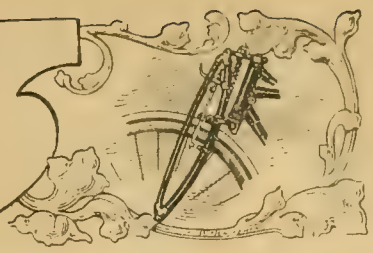
This is undoubtedly the correct explanation of the phenomenon.



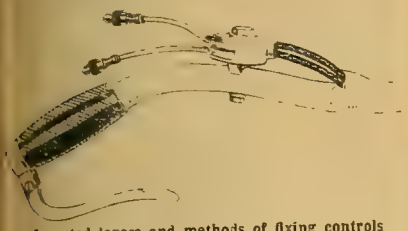
Motor cycles are being largely employed in this year's army manoeuvres, our photograph shows one of the motor cycle scouts attached to the Royal Flying Corps bringing a message to the aeroplane camp between Wantage and Shefford. His mount is a 2¾ h.p. Douglas.



1914 HUMBER MODELS.

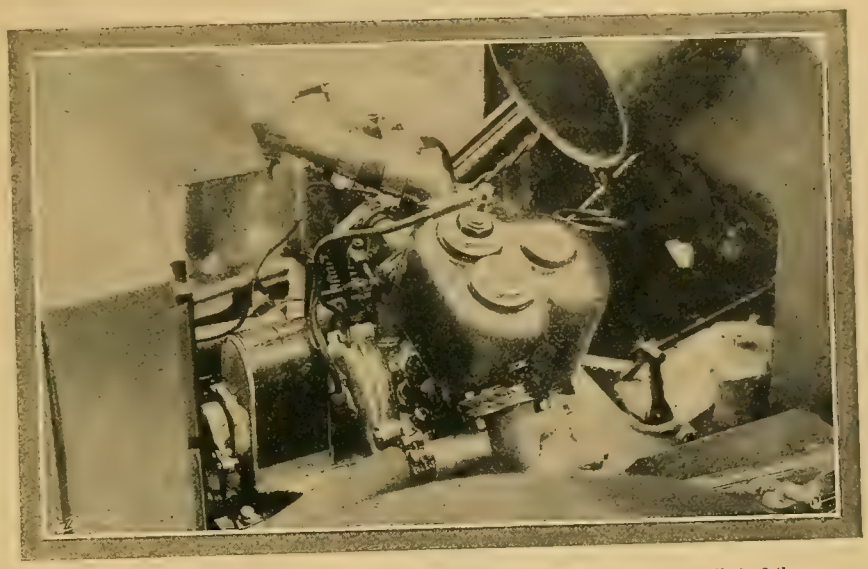


ONLY detail changes will be made for the 1914 season in the two Humber motor cycle models. The 3½ h.p. machine will, in future, be fitted with a wider tank and Best and Lloyd semi-automatic drip feed lubrication. No cut-out will be supplied, as the present silencer has been found both quiet and efficient. In future, the



Inverted levers and methods of fixing controls on the 1914 Humbers.

fork springs will be enamelled, a detail which will save owners considerable trouble, for it is almost impossible to keep plated springs bright. 2⅜in. tyres are to be standardised, which should increase the comfort of the machine as well as the tyre mileage, and the only other alterations lie in the handle-bars, which are now fitted with inverted levers and have been somewhat improved in shape. All Bowden wires are carried through the bars, and the control blocks are bolted instead of being clipped to the bars. The price of the machine will be reduced £5.

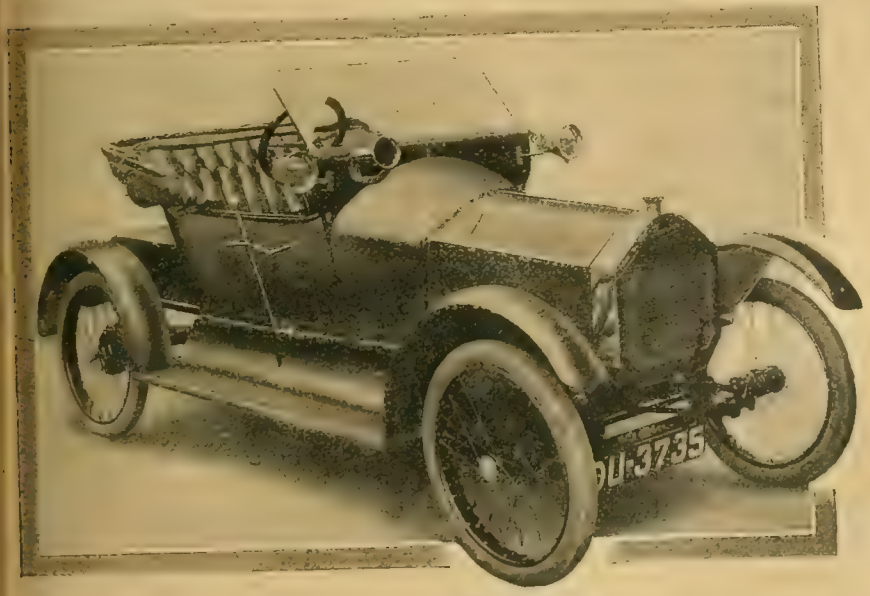


The new water-cooled engine fitted to the Humberette. The design is similar to that of the air-cooled model.

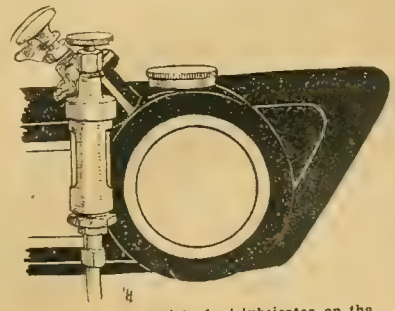
Most of the above changes apply also to the 2¾ h.p. twin. That is to say, the handle-bars are similar, drip feed lubrication, and enamelled fork springs are fitted, and no cut-out will be supplied, but will be replaced by a tail pipe. Adjustable tappets will be fitted to this model for the first time, a refinement which will enable riders to synchronise the timing to a nicety.

A Water-cooled Humberette.

With regard to the well-known and popular Humberette no alterations will be made, but a water-cooled model will be marketed, which is similar in all respects to the air-cooled model except for the cylinders and radiator. The jacketed cylinders are cooled on the thermo-syphon system, a neat radiator on the usual Humber lines replacing the dummy of the air-cooled type.

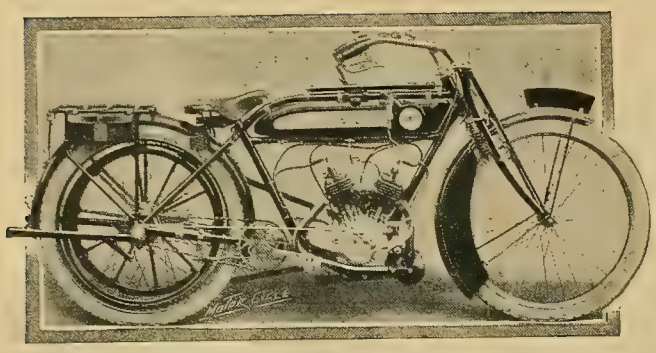


General appearance of the new water-cooled Humberette.



Arrangement of drip feed lubricator on the new Humber models.

The price of the air-cooled model, without hood screen and lamps, has been reduced to £110, and the water-cooled type, same specification, is £125. Both models are fitted with the above accessories for £10 extra.



The 2¾ h.p. Humber model showing 1914 refinements. Note the tall pipe to silencer and new handle-bars.

HILL-CLIMBING WITH A SIDECAR.

Whilst spending a week-end at Cromford, Derbyshire, W. H. Carson, the rider of a 5-6 h.p. single-cylinder Excelsior and sidecar, made an attempt on Green Hill, Wirksworth, which was the undoing of so many competitors in the A.C.U. East Midland Centre Trial on May 3rd last. This trial was fully described in *The Motor Cycle* of May 8th. Although the gradient is estimated as 1 in 4 and the surface extremely bad, the Elcelsior successfully climbed this hill at first attempt with an adult passenger on a 12 to 1 low gear.

So much local interest was displayed at the manner in which the hill was taken that the performance was repeated several times for the benefit of the villagers. This is said to be the first time this hill has been climbed by a single-cylinder machine with sidecar and passenger.

W. H. Carson climbing Green Hill, Wirksworth, on a 5-6 h.p. single-cylinder Excelsior sidecar.

CLUB NEWS.

Edinburgh M.C.C.

On Saturday next the above club will hold a members' event for the Sharp Trophy. There will be a speed contest—fast (half-mile), and slow (quarter-mile). Immediately afterwards competitors will be timed up Hartree Hill. The members' event will be followed by an open hill-climb, starting at 4 p.m.

Coventry and Warwickshire M.C.

The second annual committee run was held on Saturday and Sunday last, the destination being Rhayader. On Sunday the reservoirs in the Elan Valley were visited. Owing to heavy rain which fell on Saturday night and Sunday morning the reservoirs were very full, and the quantity of water falling over the dams presented a fine spectacle. The return journey was made *via* Leominster, Tenbury, and Abberley Hills.

Taunton and District M.C.C.

The above club held a speed-judging competition on Thursday, 4th inst. A course of two miles was traversed three times at the rates of 20, 18, and 15 m.p.h. No speedometers or watches were allowed. The result was as follows :

	Error.
F. Hansford (3½ Rover)	69⅕s.
A. J. Percy (3½ T.T. Rudge)	151½s.
G. Drayton (3½ Triumph)	161⅘s.
W. A. Hutchings (3¾ Scott)	179⅖s.

North Staffordshire M.C.

The third reliability trial was held on the 7th inst. over a course of 150 miles, starting from Whitmore, proceeding to Whitchurch, Ellesmere, Llanfyllin, Lake Vyrnwy, Bala (lunch), Llanygog, Shrewsbury, Market Drayton, and Whitmore. Results: 1, H. W. Teeton (3¾ h.p. James), full marks; 2, Jas. B. Sproston (2¾ h.p. Sunbeam), full marks; 3, W. Palmer (2¾ h.p. Douglas); 4, F. Tagg (2¾ h.p. Scott).

The Ashton Cup was awarded to the competitor making the best performance in the three reliabilty trials, this being won by H. W. Teeton (3¾ h.p. James), who gained full marks in each trial.

Manchester M.C.

A members' hill-climb will be held on the 20th inst. for motor cycles, cycle cars, and cars. The hill selected is a safe one near Buxton, and members will meet at the Midland Hotel in that town at 2.30 p.m.

The motor cycle and cycle car events will be on the "knock out" principle.

Entries (cars 5/-, motor bicycles 2/6) should be sent to the trials hon. secretary, Mr. C. E. Kettle, 210, St. Mary's St., Deansgate, Manchester.

Leicester and District M.C.C.

The third quarterly trial for the Edwards Cup was run on Thursday, the 4th inst., over a course of 74½ miles. The winner was the competitor who rode nearest to an average speed of twenty miles an hour, and made a non-stop run.

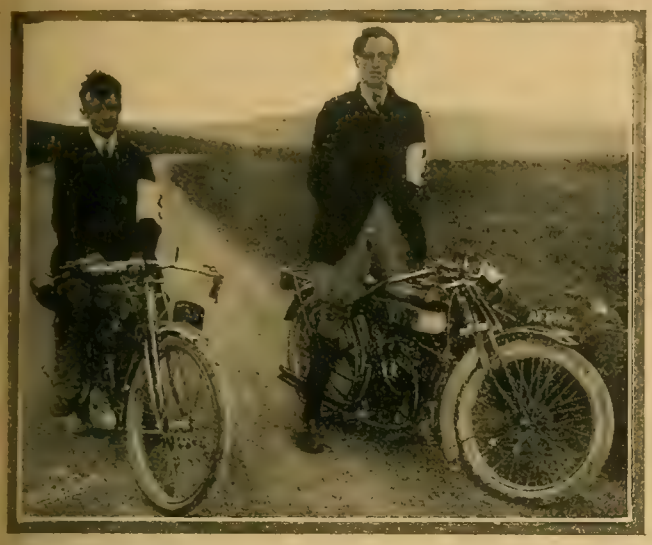
There were seven secret checks on the course, and the competitors making the least error in time were as follows: W. H. Chapman (A.J.S. sc.), 29m. 41s.; G. Upton (Bradbury sc.), 30m. 37s.; R. Wainwright (Campion), 35m. 40s.

Kingston-upon-Thames and District M.C.C.

The last event of the season will be a reliability trial for Mr. Butler's Cup, and will take place on the 21st September. The course will be from Kingston to Petersfield, *vid* Dorking, Guildford, Hindhead, and Liphook, and back home *viâ* Alston and Farnham, finishing at the Anchor Hotel, Ripley, about 4.30. The honorary secretary, Mr. J. W. Wilson, would be glad to see any intending members at this run.

North Devon M.C.C.

A hill-climb was held last week for the Mayor of Barnstaple's Cup on the South side of Codden Hill, Bishop's Tawton. A large number of spectators was present, including the donor of the cup. The results, which were decided on formula, were as follows: 1, F. C. Elliott (3½ Triumph); 2, W. H. Prideaux (2¾ Douglas); 3, P. Chanter (3½ Triumph); 4, T. Driscoll (3½ Triumph). Elliott's Triumph was an ordinary standard model, and had already covered over 7,000 miles previous to the climb.



Plymouth and District M.C.C. Hill-climb at Moorshop. (Right) P. H. T. Hoare (8 h.p. C. and H.-Jap) who made fastest time and (left) F. Thomas on a 3½ h.p. model of the same make.

The Public Schools M.C.C.

After the Streatham M.C.C. open international speed trials at Brighton next Saturday to which the Public Schools M.C.C. is sending a team, the members present will proceed to New Romney for the week end. Those desiring accommodation should write to Mr. C. Q. Roberts, Cottesmore, Fleet, Hants.

Westmorland M.C.C.

A fast and slow hill-climb was held on the 6th inst. at Hutton Park, near Kendal. The weather was favourable, and a fair number of competitors attended. Results:

		Fast.	Slow.	Difference.
		s.	m. s.	m. s.
1.	L. S. Parker (4 Scott) ...	68⅘	6 50 ...	5 41⅕
2.	Hy. Jackson (2¾ Sunbeam)	69⅗	5 52½ ...	4 42⅗
3.	R. M. Chaplow (2¾ Humber)	68⅕	5 21⅖ ...	3 53⅕

Cork and District M.C.C.

An afternoon reliability trial was held on the 10th inst. over a secret course, the use of speedometers and maps being banned. Result:

1. S. R. Hosford (3½ Zenith), Humber Cup.
2. S. H. Dring (2¾ Douglas), Mr. O'Callaghan's Prize.
3. John Healy (3½ Indian), Mr. J. Dwyer's Prize.
4. J. M. O'Neill (2¾ Douglas), Club Prize.

The course was a very sporting one, and quite unknown to nearly all the competitors.

Northamptonshire M.C.C.

Speed trials were held in Moulton Park, on the 11th inst., by kind permission of H. Manfield, Esq., M.P. The track was in excellent condition, and measured half a mile. Results:

	Rider and machine.	Time.	Formula.
	CLASS I.—SINGLES, SOLO.		
1.	Kinch (3½ Rudge)	33⅘s. ...	559
2.	Watkins (3½ Triumph)... ...	35⅖s. ...	590
3.	Stanford (3½ Triumph)... ...	40⅗s. ...	872
	CLASS II.—TWIN, SOLO.		
1.	Harris (5 Matchless)	33⅖s. ...	566
2.	Ward (2¾ Douglas)	39⅖s. ...	602
3.	Grose (7 Indian)...	31⅕s. ...	647
	CLASS III.—OPEN.		
1.	Harris (5 Matchless)	34⅖s. ...	619
2.	Kinch (3½ Rudge)	35s. ...	621
3.	Ward (2¾ Douglas)	40⅗s. ...	660
	CLASS IV.—SIDECARS.		
1.	Cameron (8 Zenith)	39s. ...	808
2.	Harris (5 Matchless)	46⅖s. ...	916
3.	Peck (3½ Triumph)	50⅕s. ...	974
	CLASS V.—CYCLE CARS.		
1.	Grose (Morgan)	50s.	
2.	Bensley (G.W.K.)	53⅖s	

Walthamstow M.C.

J. H. Kerr (3½ h.p. N.S.U.) has been awarded a silver cup for covering 200 miles over a standard course to schedule time.

Plymouth and District M.C.C.

The results of the hill-climb held on the 10th inst. at Moorshop were as follows. The course measured one mile.

SIDECARS (Twin-cylinder Class).

1, C. R. J. Roberts (6 Matchless); 2, W. J. Pitts (8 Chater-Lea); 3, T. Woolland (6 Rex); 4, J. Metherell (6 Rex); 5, T. D. A. Chapman (6 Rex).

SIDECARS (Single-cylinder Class).

1, A. Brand (4¼ Lincoln-Elk); 2, H. Holmes (4 Rex).

T.T. SINGLES.

1, T. Trinniman (3½ Rudge); 2, O. P. C. Collier (3¾ Grandex); 3, E. R. Stranger (3½ Peugeot).

T.T. TWINS

1, P. H. T. Hoare (8 Chenoweth and Hoare Jap).

Fastest time of day and club record, time 1m. 5s., a really brilliant performance for a club member.

TOURING MACHINES.

1, J. Mander (4 Rex); 2, G. E. Stephens (3½ Triumph)

The above is the last competition of the season and was most successful. The club membership now numbers 98

FORTHCOMING OPEN EVENTS.

Edinburgh M.C.C.

There will be seven classes in the Hartree hill-climb on Saturday next as follows: (1.) Lightweight handicap, not exceeding 400 c.c. (experts barred). (2.) Handicap exceeding 400 c.c. but not exceeding 600 c.c. (experts barred). (3.) Handicap exceeding 400 c.c. but not exceeding 600 c.c. (open). (4.) Handicap exceeding 600 c.c. (experts barred). (5.) Handicap exceeding 600 c.c. (open). (6.) Handicap for sidecars and cycle cars exceeding 450 c.c. (experts barred). (7.) Scratch race for any motor cycle, sidecar, or cycle car (open).

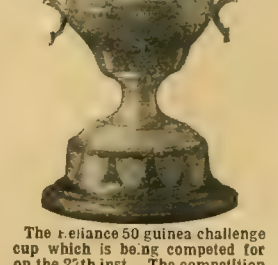
Bristol M.C.C., and Somerset A.C.

On Saturday, October 4th, speed trials (open and closed) will be run on the sands at Weston-super-Mare for motor bicycles, sidecars, cycle cars, and motor cars, starting at 11.30 a.m. The open classes will be as follows:

No 1.—Not exceeding 350 c.c., for solo machines.
No. 2.—Not exceeding 500 c.c., for solo machines.
No. 3.—Unlimited.
No. 4.—Not exceeding 500 c.c., for sidecars.
No. 5.—Unlimited.
No. 6.—Cycle cars. A.C.U. definition (three or four-wheelers).

The latest date for receiving entries will be the 26th inst. These must be sent to Mr. Philip Grout, Warmley, near Bristol.

Liverpool A.C.C.



The Reliance 50 guinea challenge cup which is being competed for on the 27th inst. The competition is the Liverpool A.C.C. open reliability trial.

A one-day open reliability trial for the Reliance Cup will take place on Saturday, the 27th inst., starting from Queen's Ferry at 8 a.m. The course will be a circular one in North Wales, and will include the ascent of Bwlch-y-Groes. Solo machines will cover 117¾ miles and passenger machines 6¼ miles less. To qualify for a gold medal the rider of a solo machine over 350 c.c. or passenger machines of 600 c.c. or over must climb every observed hill at the first attempt. Riders using smaller engines will be allowed one failure on observed hills without loss of medal.

Late entries close on the 20th inst., and all communications must be sent to Mr. S. W. Phillpott, 1, Oakdale Road, Mossley Hill, Liverpool.

Mersey M.C. Open Hill-climb at Pen-y-ball.

EXPERTS BARRED.

QUITE a large number of spectators turned out to watch the Mersey Club's open hill-climb at Pen-y-ball on Saturday last. Owing to recent rain the hill was somewhat loose and wet in places, which, added to the usual stony surface intersected at intervals with rain gullies, tended to prevent really high speeds. However, the bad parts of the hill were carefully swept, and on the whole the surface was quite fair. The climb was timed to start at three o'clock, and, in spite of this somewhat late hour, the first man was not sent away till just after 3.30. This, and the unnecessarily long waits between classes, rather protracted the event, and the last two classes were run off before a very small "audience," but, owing to fourteen absentees, the event was finished by the time stated (six o'clock).

Where Non-experts Fail.

Practising went on merrily before the event, and was responsible for one accident, Martin Anderson's 2¾ Humber being put out of action by some descending machines. Though Anderson was only slightly hurt, the smash was particularly regrettable, as his little Humber was going particularly well, and was quite one of the fastest lightweights present.

Throughout the day over-gearing was particularly noticeable. Fixed geared machines had too high gears, and variably geared machines were kept on their higher gears too much, and it is in this very point—correct gearing—that the experts score so much.

Each class was divided into a time and handicap event, competitors being handicapped on their previous times; thus each man had two tries at the hill, but no one was allowed to beat his time performance by more than 5%.

Class V., for single-cylinder sidecar machines, was the first to be run off, but attracted only two starters, Barnard (3½ Singer sc.) making easily the finest performance; he kept his engine roaring on the low gear and beat his adversary by nearly a minute. Results:

		m.	s.
1.	G. G. Barnard (3½ Singer sc.)	1	22⅘
2.	H. C. Marston (3½ Triumph sc.) ...	2	19⅗

The Passenger Classes.

Class VII., for passenger vehicles up to limit sizes (on time), followed. E. Longdon (8 Dot sc.) and H. W. Coopland (7 Indian sc.) had it all their own way in this event. Coopland's machine was misfiring slightly on the steep part, otherwise a close finish between these two would have ensued. W. H. Kelly (8 Rex-Jap sc.) and J. McKie (6 Clyno sc.) both came up steadily, as did the Humberette driven by A. C. Whitney. Results:

		m.	s.
1.	E. Longdon (8 Dot sc.)	1	14⅗
2.	H. W. Coopland (7 Indian sc.)	1	19⅖
3.	W. H. Kelly (8 Rex-Jap sc.)	1	43⅗
4.	J. J. McKie (6 Clyno sc.)	2	8⅘
5.	A. C. Whitney (8 Humberette) ...	2	26⅕

The above two events were next run off on handicap, the performances being much the same as before. H. C. Marston and A. C. Whitney both came to a standstill through gear changing. Results:

CLASS V. (Handicap).

		m.	s.
1.	G. Barnard (3½ Singer sc.)	1	24⅕
2.	H. C. Marston (3½ Triumph sc.) ...	1	24⅗

CLASS VII.

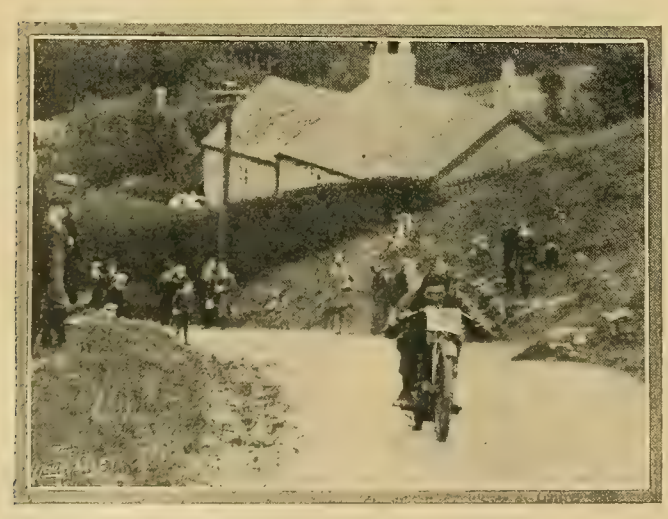
		m.	s.
1.	E. Longdon (8 Dot sc.)	1	13⅘
2.	W. H. Kelly (8 Rex-Jap sc.)	1	19⅕
3.	H. W. Coopland (7 Indian sc.)	1	22
4.	J. J. McKie (6 Clyno sc.)	1	24⅖
5.	A. C. Whitney (8 Humberette)	2	17⅖

Class III., solo up to 750 c.c., was poorly supported, there being only three starters. T. E. Cooper made two ascents, the second being not so good as the first. Sedgwick brought his Rudge up in good style, but A. J. Moffatt was clearly the fastest. Results:

		m.	s.
1.	A. J. Moffatt (5 Zenith)		57⅘
2.	J. H. Sedgwick (5 Rudge)	1	1⅕
3.	T. E. Cooper (4¼ Mead)	1	22⅖

Class IV., up to 1,000 c.c. Considering the size of the machines the performances in this class were poor. True, the hill was not in perfect condition, but there was a great deal of cutting out and the big machines did not seem to have the pace they should have. L. V. Barton (6 Rex) was an exception, and made a good show, and F. Shaw (8 Zenith) came up well, though he wobbled a good deal when changing gear. E. F. Baxter, who may usually be relied on to make a good performance, was not in form. W. H. Brown Bowley was overgeared and failed after getting over the worst part. (For results, see next page.)

W. H. Garlick (2¾ h.p. Hobart). This machine has both valves in the head and made a very fine ascent.



H. G. Liefeldt (Rudge) on the steepest portion of the hill. His performance was a remarkably fine one, as he made fastest time of the day.

Mersey M.C. Open Hill-climb.—

Time.

		m. s.
1.	L. V. Barton (6 Rex)	0 57⅘
2.	F. Shaw (8 Zenith)	0 60⅕
3.	W. Shaw (8 Dot)	0 60⅗
4.	N. C. Sclater (8 Matchless)	1 3⅕
5.	W. H. Kelly (8 Rex-Jap)	— —
6.	E. F. Baxter (6 Rex)	— —

The handicap performances in these two classes produced nothing remarkable. W. Shaw stopped owing to a dirty plug and an air leak due to his carburetter attachment working loose, and Sclater fell near the finish, fortunately without serious damage. Results:

CLASS III.

Handicap.

		m. s.
1.	J. H. Sedgwick (5 Rudge)	0 50⅘
2.	A. J. Moffatt (5 Zenith)	0 52⅕
3.	T. E. Cooper (4¼ Mead)	0 53

CLASS IV.

Handicap.

		m. s.
1.	L. V. Barton (6 Rex)	0 51⅘
2.	W. H. Kelly (8 Rex-Jap)	0 53⅕
3.	W. Shaw (8 Dot)	0 55⅖
4.	N. C. Sclater (8 Matchless)	0 59

Class II. (solo machines up to 500 c.c.) was quite the event of the day. Not only did it draw more starters than any other class, but it produced the fastest time of the day. This was done by H. G. Liefeldt, who rode magnificently, and who was one of the very few riders of fast machines who really let his mount go. Next fastest was L. Mogridge, whose Triumph produced a most wonderful crackle. Besides these, T. W. Hand, P. Webster, G. Barnard, and C. L. Binks all made fine performances.

It will be noticed that several of the times in this class are better than the best in the 1,000 c.c. class. Results:

Time.

		m. s.
1.	H. G. Liefeldt (3½ Rudge)	0 51⅘
2.	L. Mogridge (3½ Triumph)	0 53⅖
3.	T. W. Hand (3½ Hand-Jap)...	0 57⅖
4.	G. Barnard (3½ Singer)	0 57⅗
5.	P. Webster (3½ Martin-Jap)	1 1⅖
6.	C. L. Binks (3½ Fafnir)	1 9⅖
7.	H. V. Prescott (3½ Ivy-Precision)	1 11⅕
8.	S. W. Carty (3½ Ariel)	1 23⅗
9.	A. Marston (3½ Scott)	1 41

In Class I. up to 350 c.c. W. H. Garlick, on an overhead valve Hobart, made a particularly fine climb, his time being better than most of the 8 h.p. machines. Rees made the next best performance, but was 13s. slower. Results:

Time.

		m. s.
1.	W. H. Garlick (2¾ Hobart)	0 59⅕
2.	F. Rees (2¾ Douglas)...	1 12⅖
3.	C. J. Naylor (2¾ Douglas)	1 14⅗
4.	A. J. Jenkins (2¾ Douglas)	1 16

The results of the above two classes on handicap were as follows:

CLASS II.

Handicap.

1.	P. Webster (3½ Martin-Jap)	0 50⅕
2.	H. G. Liefeldt (3½ Rudge)	0 51⅕
3.	G. Barnard (3½ Singer)	0 52
4.	L. Mogridge (3½ Triumph)	0 54
5.	T. W. Hand (3½ Hand-Jap)	0 57

CLASS I.

1.	A. C. Naylor (2¾ Douglas)	0 57
2.	W. H. Garlick (2¾ Hobart)	0 60⅕
3.	F. Rees (2¾ Douglas)	0 60⅗
4.	A. J. Jenkins (2¾ Douglas)	1 2⅖

The following will be awarded prizes for the best amateur performance in each class:

Class I.—W. H. Garlick (2¾ Hobart).
Class II.—H. G. Liefeldt (3½ Rudge).
Class III.—A. J. Moffatt (5 Zenith).
Class IV.—L. V. Barton (6 Rex).
Class V.—G. G. Barnard (3½ Singer sc.)
Class VII.—E. Longdon (8 Dot sc.)
Class VI. did not receive sufficient entries.

After the climb the officials adjourned to the King's Head Hotel, where the results were properly worked out, and were made known by soon after 7 p.m.

Mr. Carty, the club secretary, was unfortunately rather late arriving, owing to pressure of business, which may have accounted for some of the delay. However, when he appeared he put in some hard work.

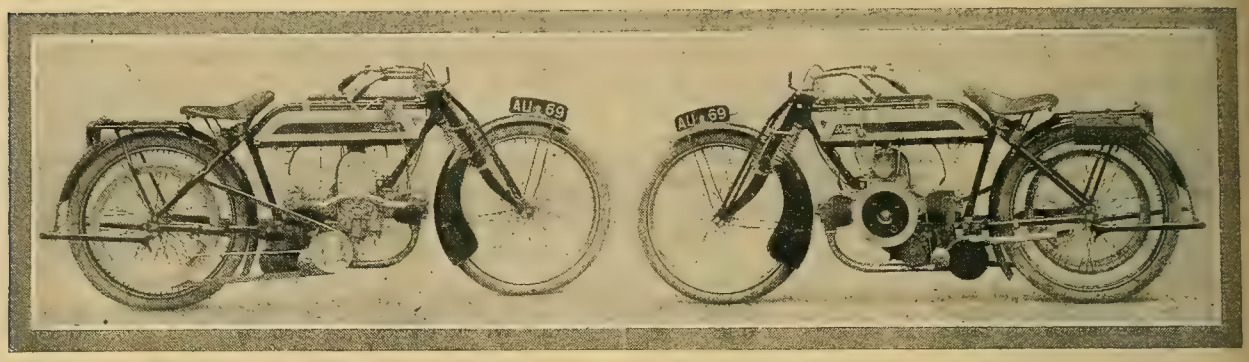
Where are the Amateurs?

We have heard a good deal lately with regard to the lack of opportunities for amateurs in hill-climbs, so that it is very disappointing to see an event organised specially to give them a chance so poorly supported. The Liverpool M.C.'s idea of holding an open expert barred climb on such a well-known hill was an excellent one, and deserved a large entry. Unless amateurs show more enthusiasm for events which are arranged specially for their benefit they cannot expect their complaints to be taken seriously. Of course, this event was held rather late in the season, but all the same we cannot think that the North-country amateurs can be as keen as they are said to be when they turn out in such meagre numbers.

W. Copeland (7 h.p. Indian sidecar) who was second on time in Class 7. E. Longdon (8 h.p. Dot sidecar) who won the same class on time and handicap.

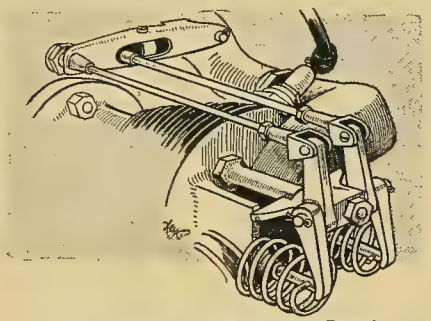
THE BROUGH 500 c.c. TWIN.

Special Features: Overhead Valves, Two-speed Gear Box, and Detachable Magneto.



Belt transmission and flywheel sides of the new 3½ h.p. twin-cylinder horizontally opposed Brough. The drive from the engine to the two-speed gear box is by chain.

AN exceedingly interesting machine, which is the result of three years' careful experimental work, is the 3½ h.p. horizontal twin Brough motor bicycle, made by Brough and Co., Basford, Nottingham. The engine is, of course, the most interesting feature of the machine. The dimensions are 70 bore by 64.5 stroke. The valves are of the overhead type, with the seating actually in the cylinder. The detachable portions, held in by a bridge piece, are merely the guides to the valve stems. The valves are so designed that in case of breakage they cannot by any means fall into the cylinder. The exhaust valve



Combustion head of the 500 c.c. twin Brough showing overhead valve mechanism.

is arranged so that it has a sharp lift and also closes quickly, thus keeping the engine cool. In fact, after between three and four thousand miles test running, the plating on the exhaust pipes is not discoloured in the slightest degree. The crank case is of one casting, so that oil leaks will be entirely absent. The cylinders are spigoted $\frac{5}{8}$in. in the crank case, thus rendering the fixing thereof very firm.

The carburetter is a special type of Senspray with a horizontal jet, attached to a short pipe brazed on to the centre of the inlet pipe, and is specially made for the Brough firm.

A Neat Magneto Coupling.

The U.H. magneto is fixed on the top of the crank case and held by nuts and two special washers, shown in the accompanying illustration. If these nuts are loosened, the magneto, which is driven by means of a dog, can be withdrawn instantly without disturbing the timing gear in any way.

The exhaust lifter is of particularly neat design, and is so arranged that the inside wire of the Bowden control pulls one lifter and the outside wire pushes the other, thus ensuring an equal lift on both valves.

The crank case release is situated on the top of the crank case, thus releasing the pressure and not wasting the oil.

Bolted underneath the crank case, and forming a unit with it, is the two-speed dog clutch gear box, the shaft of which is driven by chain from the engine-shaft.

The silencer is another interesting feature. It consists of a very large expansion chamber, into which the two pipes from the exhaust ports are led, so as to give a swirling action, the exit pipe being fairly long. It is very quiet, and should be quite devoid of back pressure.

Accessibility Well Studied.

The whole machine is particularly well finished, the castings being very clean, while the chief point aimed at and attained is accessibility. An adjustable pulley is fitted, giving a range of gearing between 4 and 6½ to 1 on top speed. The rear brake is provided with a long shoe, which is carried in a slotted lug brazed on to the chain stay, and is applied by a good size pedal connected to the brake by a short rod giving a direct pull.

The back tyre is very accessible, as the mudguard is fixed by the carrier stays and the stand. Druid forks are fitted. The saddle is 29½in. from the ground, and the crank case clearance is 5in., which is a point of particular interest to colonial riders. The tank holds nearly two gallons of spirit. The lubricator is the well-known Best and Lloyd drip feed. The total weight of the machine, we are informed, is 154 lbs. It will be noticed from the illustrations that the frame is particularly well designed.

We had an opportunity of seeing this machine at Messrs. Robertson's garage, 159, Great Portland Street, W., recently, and were particularly impressed by the way in which it started from cold, and also by its extreme controllability. Brough and Co. are also bringing out another model, which is being specially designed for sidecar work as a kick starter and clutch will be fitted.

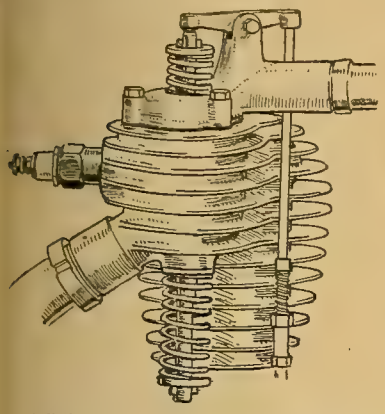
OILDAG.

We have lately made a short trial of Oildag, a new lubricant, which is a deflocculated graphite made by artificial means which is far finer and purer than commercial graphite. This graphite is a by-product formed in the manufacture of carborundum by the Acheson Co. A small tin of this is mixed with a gallon of lubricating oil which must not be in any degree acid. The Oildag is then held in suspension after being well mixed and is said to have a very beneficial effect upon the valves and cylinder. It can be used with advantage on any bearing surfaces. Oildag can be obtained from Mr. B. W. Shilson, 28, Spencer Avenue, Coventry.

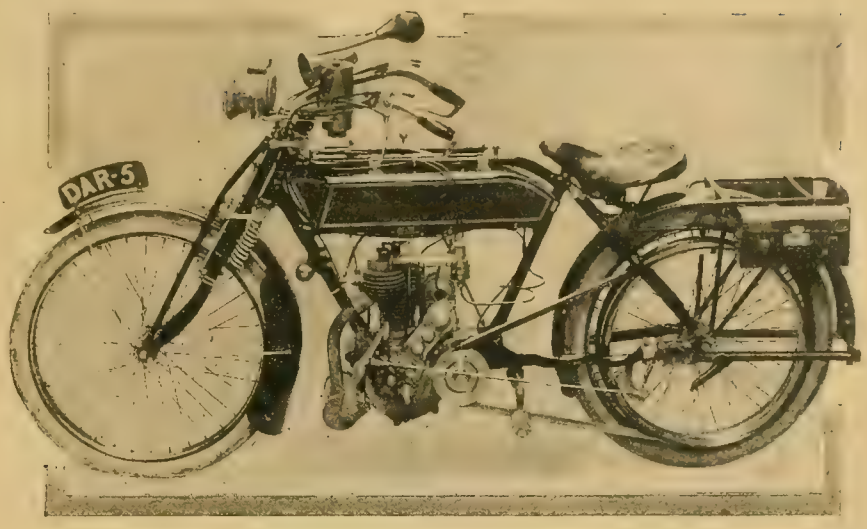
The 2¾ h.p. Villiers on the Road.

DURING the last few days we have had the opportunity of testing a 2¾ h.p. Villiers power unit on the road, and we can fairly state that for a fully fitted touring machine of its size the power produced was remarkable. The machine, which was kindly lent us by the Villiers Co., was by no means a new one, but our first short trip showed that it had ample power, and



Cylinder of the 2¾ h.p. Villiers showing overhead inlet valve mechanism, spring tappet, etc.

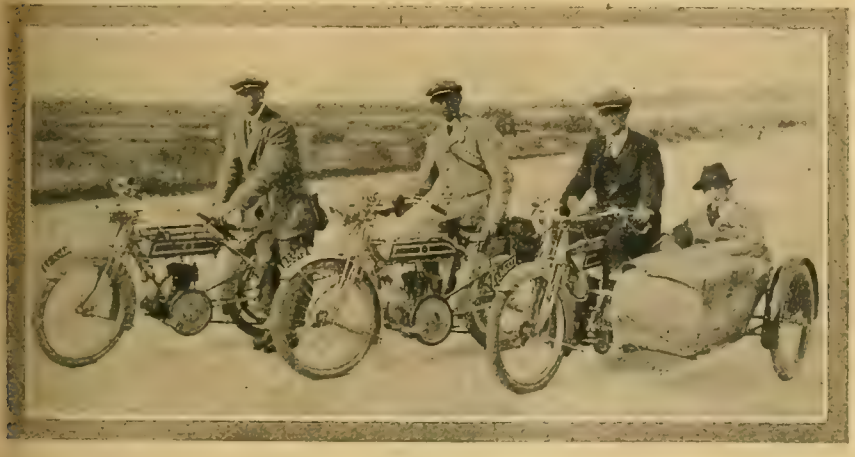
would pull up a hill of 1 in 9 on top from a very slow start—no mean performance for a 350 c.c. engine on a 5½ to 1 gear. It will be remembered that the two-speed gear is incorporated in an extension of the crank case, and is driven by an enclosed silent chain. The gear was quiet in action and changing is particularly easy. On Saturday last the machine was ridden to Brooklands, and gave no trouble whatever except for a choked oil pipe, a misfortune which might have occurred to any machine. On a trial round the course an unofficial speed of 46 m.p.h. was obtained for the lap, which must be considered distinctly good for an untuned touring machine. The handle-bar controlled clutch is extremely handy and a very convenient device, especially in traffic, and on the machine in question the phosphor bronze cone works particularly smoothly. Altogether we are thoroughly satisfied that the 2¾ Villiers is a soundly constructed unit



The 2¾ h.p. two-speed Villiers on which we made our test last week-end.

The Blackburn Motor Bicycle.

WE recently spent an interesting time at the works of Messrs. Burney and Blackburn, Berkhamstead, inspecting the latest models turned out by the firm. Since the machine was described in *The Motor Cycle* early this year (Jan. 16th), the design has not undergone any startling alteration. The frame has a longer wheelbase, slightly different back stays, and a new design of release valve which does not allow any escape of oil. The silencing arrangements are both neat and effective. The exhaust gases, after passing through a long pipe, enter a pear-shaped aluminium expansion chamber. The first pipe is blocked by the tapered end of the exit pipe, which fits into it, the gases issuing through holes into the expansion chamber, which they finally leave through holes in the exit pipe. The exit pipe is of ample length and has a flattened end, while a series of holes is drilled from its extremity for some distance. These, besides relieving back pressure, considerably reduce the noise, and we were so well impressed with the idea that we tried it on our own machine, with most satisfactory results. Druid forks are now fitted. It is interesting to note that the handle-bars are tapered so that the rider may have a comfortable grip at and near the extremities, while towards the centre they are considerably thicker and consequently have ample strength. The large outside flywheel, which is one of the chief features of the engine, is considerably lighter than the two inside flywheels of the average 500 c.c. single. So easily does the machine start that, on seeing Mr. C. S. Burney start his single-geared mount at walking pace, we asked him if a decompressor was fitted. He at once pointed out that such was not the case, as the easy starting at slow speeds and the wonderful slow running were chiefly due to the large flywheel. On the road we found the machine to be perfectly delightful. The particular model we rode was fitted with the Sturmey-Archer three-speed gear. The accompanying photograph shows three types of Blackburn machines, the 3½ single gear, and the 3½ three-speed model, ridden by the brothers Burney, and the sidecar model driven by C. Q. Roberts. The Blackburn is certainly a well-made and well-designed machine. It made its first important *début* by winning a gold medal in the recent Six Days Trials.



Three types of the latest pattern Blackburn, photographed at Brooklands.

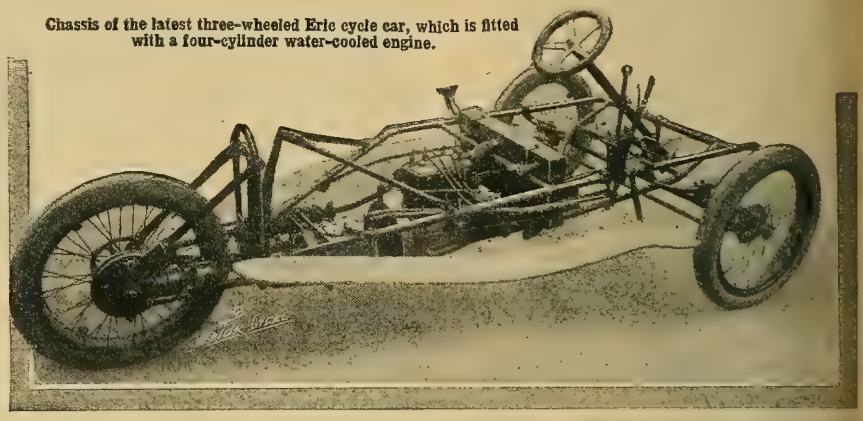
The 1914 Eric Three-wheeled Sociable.

IT is just eleven months since we described the Eric Sociable, which is manufactured by the P. and C. Syndicate, of Northampton and Bedford. It will be remembered that the frame is tubular, and is chiefly noteworthy for the system of back springing employed. The rear wheel is carried in a separate double triangular frame, attached to the forward end of the base of which is a single laminated steel spring, the top of which is anchored to the main frame. The near side of the two triangles which carry the rear wheel is hinged, so that after undoing one nut it may be swung to one side, leaving the wheel entirely exposed, so that a tyre repair may be easily effected. Ordinary semi-elliptical springs are fitted to the front wheels.

The chief improvement for 1914 is the fitting of a four-cylinder water-cooled engine. This has the cylinders cast *en bloc*, and the cylinder dimensions are 56 × 76 mm. The valves are enclosed, and the lubrication is by pump delivering the oil from a sump to the main bearings and spraying it to all moving parts. Both the engine and the three-speed gate change gear box are manufactured by Messrs. Salmon, of Burton-on-Trent, who are specialists in this sort of work.

The Bosch magneto is driven by skew gearing. The water-circulation is arranged on the thermo-syphon principle, the radiator being carried below the body, but in a position which renders it accessible to the air. The final drive is by bevel gearing, while the propeller-shaft has a universal joint at each end.

During a twelve mile run we noticed that the vehicle was particularly well sprung—in fact, although only the roughest type of test body was fitted, it was impossible to tell whether one was on a three-wheeled or a four-wheeled car, while the engine ran very smoothly.



Chassis of the latest three-wheeled Eric cycle car, which is fitted with a four-cylinder water-cooled engine.

Nine Months with a Modern Lightweight.

IT is always a sad moment when one has to part with a trusted mount, and the writer can say that he has never said good-bye to a more keenly appreciated motor bicycle than his 2¾ h.p. Douglas. It was delivered in September last year at short notice, and was practically a 1913 model. In fact, the only conspicuous 1912 features about it were the mudguards and the inlet pipe.

Its first journey was from London to Le Mans, which it accomplished successfully, though it was quite "raw." However, the trip there and back did it a great deal of good, and after the silencer had been cleaned out (as the engine had been much over-lubricated), it finished the last part of the journey in splendid form.

Since that date it has followed numerous trials and competitions and accomplished much valuable work in the shape of sundry business calls.

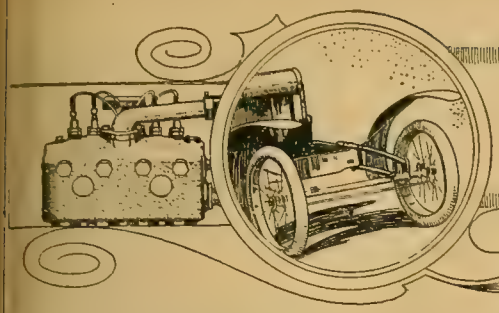
To our mind the control was improved by the fitting of a Lukin carburetter, which behaved splendidly, and is now doing equally good work on another Douglas owned by a well-known motor cyclist. Later a Binks was fitted, which was just as satisfactory. Both have been reviewed in *The Motor Cycle*, and both have left the owner a profound admirer of the automatic carburetter. For town work and general purposes a good, well-tuned, automatic carburetter cannot be beaten. True, it may not be quite so economical, and may be a shade less efficient than the two-lever type, but, take it as a whole, it is entirely satisfactory.

Naturally, in the course of following trials the machine was put at and successfully climbed many abnormal hills, and on these occasions the adjustable pulley, which enabled a general reduction of gears to be made, came in handy.

Among the excellent qualities possessed by the Douglas were its comfort, owing to the handle-bars and riding position, which were quite ideal, the vibrationless qualities of its well balanced horizontal engine, and its extraordinary steadiness on the greasiest roads. The machine proved itself to be reliable, and the valves were never changed, while the ease with which the engine started was quite remarkable. One could literally walk it off when seated in the saddle by engaging low gear, raising the exhaust lifter, and taking a couple of lazy steps before releasing the valve.

When new the exhaust was rather too noisy, but this was remedied by removing the baffle plates and stopping the holes in the silencer by means of a plate riveted on, and by fitting a long exit pipe.

In giving our experiences with this machine, our chief difficulty is to avoid praising it unduly, but its behaviour was so satisfactory that we cannot but give it the eulogy it has earned. The machine also had a good turn of speed, and could attain nearly fifty miles an hour on Brooklands, while its final achievement while in our possession was to gain a gold medal on the London-Edinburgh run. It suited the particular work it was intended for admirably, and now that it has left our possession it is greatly missed.



CYCLE CAR DESIGN.

THE INFLUENCE OF CORRECTLY-PROPORTIONED GEAR RATIOS.

A MATTER which will have a very great influence on the success of the cycle car is the correct choice of the gear ratios. This is, properly speaking, a subject which is divided into two parts, first the ratio of gear on the top speed, second the ratios of the various speeds to each other.

Cycle cars are of such various types as regards the transmission gear that it is not so easy to generalise about them as in the case of cars whose transmission varies very little. However, a large proportion of cycle cars have a direct drive on the top speed and some kind of change-speed gear giving one or more lower speeds, and this type will therefore be assumed.

In this case it is usually not difficult to change the ratio of the top speed, and this can therefore be varied according to the load and the engine power. The only remark necessary to make about it is that it is well, when designing the transmission, to arrange that a considerable variation of gear can be provided if required. Thus in a bevel driven axle the casing should be so arranged that a considerable variation of gear can be used without either of the wheels fouling the casing.

Variation of Ratio in Gear Box.

The change-speed gear is, however, in a very different position, for it is usually not at all easy to vary the ratios between the different speeds when once the box is built up, at all events without considerable expense. In some forms of change-speed gear this can no doubt be done, but in many it involves an alteration of the centres of the wheels.

The two most important gears to settle are the top and bottom. The latter must, of course, be low enough for the vehicle to ascend any hill it is likely to come across, while the former must give reasonable speed on the flat without unduly racing the engine. If the difference between the top and bottom ratios be too small, it will be found that if the car is geared high enough to run nicely on the flat it will fail on steep hills, while if geared for the hills on its bottom the engine will have to race a great deal on the flat.

On the other hand, if the difference between the top and bottom be too great the car will be very slow on hills when the first speed is in use. To those who tour in a great variety of country this is the lesser evil of the two. In considering the bottom speed of a cycle car, it is well to remember that cycle cars may largely take the place of motor cycles and sidecars in the future, and that sidecars are very much used in the North, where the country is hilly.

Practically all sidecar machines have a change-speed gear and usually a much higher power in proportion to their weight than cycle cars.

If a cycle car is to be capable of going up all the hills which are likely to be met with in a tour over picturesque country, it must be capable of ascending a gradient of 1 in 4, and, further, it should be capable of doing this even if the surface is not in very good condition. It may be thought that this is an excessive allowance, but Sutton Bank is slightly steeper than 1 in 4, and it is situate on a main road. Cycle cars should not, however, be confined to main roads, and, if other examples are taken, there are many hills worse than Sutton Bank, *i.e.*, many are as steep and have much worse surface and often sharp turns at the steep part.

Gear Ratio for 1 in 4 Grades.

The tractive resistance of a motor car on a gradient of 1 in 4 is one-fourth the weight of the vehicle plus the rolling resistance on the road. If the road resistance be taken at 60 lbs. per ton, which is by no means high for this type of hill, then the total resistance is 620 lbs. per ton.

It is therefore evident that the low gear must be low enough to give a tractive force of this amount or the car will fail on hills. The low speed is, therefore, fixed by this regardless of the number of speeds provided.

The most convenient top speed, however, will depend largely on the number of speeds provided. It is extremely inconvenient to have the gaps between the speeds too great, while, on the other hand, for a given weight and price, the fewer speeds the greater the

Miss M. Corkindale, of New Zealand, an enthusiastic rider of a 2¾ h.p. three-speed New-Hudson which she manages with perfect ease.

Cycle Car Design.—

power which can be provided, hence the bottom speed can be higher.

Gear Proportions and Tractive Force.

Taking the three-speed car first with a direct speed on top and the usual motor car type of change speed gear, it is not usually worth while to gear it to go up hills on top speed steeper than about 1 in 18 continuous rise. A car so geared will go over practically the whole of the Portsmouth Road on its top, and to gear it lower means running the engine excessively fast. This means a tractive force of 184 lbs. per ton on the top speed.

That is to say, the tractive force on the low speed must be 3.4 times that on the high. If the loss in friction were the same on the bottom gear as the top the ratio between the top and bottom speeds would be the same as that of the tractive forces, *i.e.*, 3.4. In practice, however, the drive of the low speed is usually through two extra gears, and there is, therefore, a considerably greater loss through friction. This must be added to the gear ratio, so that if the extra friction is 10% the total gear ratio between top and bottom must be 3.75.

The best ratio for the intermediate speed can be found in a similar manner if it is settled what gradient the car should ascend on second.

Two or four speed cars can have their gear ratios calculated in a similar manner, the ratios being naturally less in the two-speed, as steeper hills will have to be taken on the top to avoid dropping on to the bottom gear, while they can be higher in the four-speed as there are three lower speeds to fall back on instead of two.

Past Failures must not be Repeated.

In the past many failures have occurred through the ratio between the top and bottom gears not being wide enough, and it is most important that this should not be repeated in the cycle car. People will generally want their cars to go a reasonable speed on the flat without racing the engine, and as trial runs are usually mainly on moderately flat roads this will largely determine the sale of the cars. If the ratio is too low this will mean the car failing on the hills, and nothing excites ridicule of any type of motor in these days so much as failure to go up hills. Now failure to go up hills does not always depend on want of engine power, but is largely due to the designer not having proportioned the low gear correctly.

As an instance of this, the case of a certain car may be mentioned which had a ratio between top and bottom speed of practically 3 to 1. This car was run in the Scottish Trials three years running, and every year failed to get up the hills without being pushed, though none of the trial hills were steeper than 1 in 5. Had the low gear been lowered to about one-fourth of the top it would have got up them easily.

ENGINEER.

The General Utility of Candour.

THOSE who closely followed the reports of the Auto Cycle Union Six Days Trials at Carlisle will remember that, in allotting marks, the judges took into consideration the question of "general utility." Precisely what these gentlemen meant is known only to themselves, and so far as their official report reveals anything, the secret is still locked in their breasts. To the ordinary "motor cyclist in the street" such a term would convey that a machine which gained full marks in this respect was a go-anywhere mount, would start from a standstill, and be exceedingly flexible under load. As all the survivors of the strenuous trial must have been fairly competent to pass such tests, otherwise they would not have found themselves in Carlisle skating rink under the judges' eyes, one is a little at a loss to know how or why the judges gave or deducted marks under this heading. And this non-revealing of official knowledge gained by inspection of the surviving machines opens up a very important point affecting the private user, for whose benefit these trials are, or ought to be, mainly conducted. For the most careful perusal of the judges' report reveals precisely—nothing!

It is a document, the composition of which, by a rising diplomat, would immediately mark him down for promotion to the highest ambassadorial post. It says so little in such a number of words. We are told, for instance, that control wires were often broken and badly fitted. Why are we not told to which machines these remarks apply? Again, the report says that many machines showed signs of considerable oil leakages, but no mention is made of the offenders. How then can the prospective purchaser decide which is the most suitable machine for his requirements; and so on throughout the report? This lack of candour, I consider, by a body such as the A.C.U., is entirely to be deplored. The whole essence of a big trial is to reveal the truth and the *whole* truth. Why cannot a complete report on every finishing machine be tabulated and published? Are the manufacturers averse to such a course, and, if so, is the A.C.U under the thumb of the manufacturers? The whole report is a masterpiece of partial revelation. I, for one, hope that in succeeding years the authorities will lift the veil with rather more freedom than they do at present. By this means trials would increase enormously in value; and, after all, the private-owner pays the piper in the long run, so it is only fitting that he should call the tune.

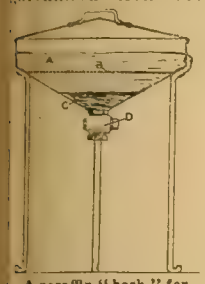
As things are at present the A.C.U. is nothing like so outspoken as is the R.A.C. when that club issues reports of trials held under its auspices. It does not matter how small the accessory to be tested, or how important the car, the report is always a plain unvarnished, bald statement of what happened during the trial, and showing precisely how the article in question comported itself under test. Let the A.C.U. follow suit. Technical reports may not be the most enlivening of literature, but to the student of form they convey as much interest as a perusal of "Ruff's Guide" does to the racing man. The form of all machines in a trial should be made public, and they should be entered for trial under that understanding. I do not in the least imply that facts are deliberately withheld, but I do urge most strongly that future reports should be complete documents.

SPARKS.

AMONG THE ACCESSORIES.

Paraffin "Bosh" for Cleaning Purposes

Messrs. Ralph H. Haylock and Son, 3, Queen Victoria Street, E.C., have introduced a paraffin "bosh" for cleaning machines, or parts of machines, which will be of considerable use to motor cyclists who have their own motor houses. The "bosh" consists of a cylindrical galvanised iron vessel, nineteen inches in diameter, supported on three legs and having a perforated metal filter placed about two inches from the top. The function of this filter is to obtain a clear body of paraffin or petrol free from all sediment and dirt, which always gets stirred up by the brush when it is dipped into the liquid to clean the machine. The apparatus is fitted with a lid at the top preventing evaporation when not in use, and a plug cock at the bottom for cleaning out the accumulated sediment. Its price is 12s. 6d., and besides being handy it should soon save its cost owing to the way paraffin or petrol is economised.



A paraffin "bosh" for cleaning purposes.
A. Filtered paraffin.
B. Filter.
C. Sediment.
D. Plug drain cock.

Cann's Rustproof Tyre.

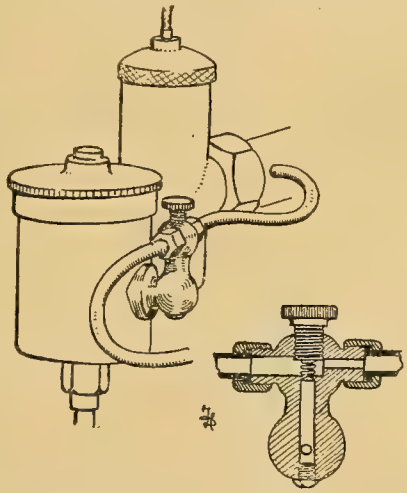
We have had one of these tyres in use for some little while on the back wheel of a chain-driven two-speed machine. The distance traversed is, up to the present, 1,900 miles (by speedometer). The ribs on the tread show practically no sign of wear, and the edges are as sharp as when first fitted. The tyre is not cut nor has it been punctured, and the rubber on the walls is still in perfect condition.

We have already published a description and illustration of this excellent tyre; it will therefore suffice to remind our readers that the bead is covered with a strip of chrome leather, which strengthens the tyre and at the same time prevents any rust there may be on the rim from having any injurious effect on the rubber and canvas of the bead. We are glad to be able to say that our experience of this tyre has been such as to give us a high opinion of it.

Tom Cann, Ltd., Applegate Street, Leicester.

A Bypass.

An improved type of bypass is at present before us, one of the chief features of which is the fact that there are no tiny orifices, and that the jet is of normal size. The device consists of a small jet chamber with a screw top to control the suction on the jet. This chamber is attached to the float chamber with the orifice $\frac{5}{8}$in. below the petrol level, and from it a small pipe is led to the main inlet pipe; a second pipe is arranged to draw warm air from any convenient part. The bypass weighs only a few ounces, and can be fitted by any average mechanic. The chief object of the bypass is, of course, to obtain slow-running and easy starting, but it is also claimed that cooler running results from its use.



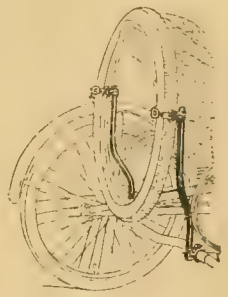
Section of Badcock's bypass also sketch showing how it is fitted to the carburetter.

F. Badcock, 110, Woodville Road, Thornton Heath, Surrey.

Spare Tyre Carrier.

The attachment of a spare tyre to the sidecar seat or chassis is sometimes rather awkward to arrange, depending on the design of the sidecar, and if attached in such a position that the tyre rubs against any projecting bolt or nut on the chassis, it is often found, after it has been carried about for a thousand miles or so that, on attempting to use it, the cover is badly chafed, particularly if the straps are not buckled very tightly.

Hunts, Ltd., 117, Long Acre, W.C., have sent us an illustration and particulars of their sidecar spare tyre carrier, which consists of a couple of adjustable arms attached to the rear tube of the sidecar chassis by means of clips. The strap holders at the top of the arms are adjustable to any position, and will hold any size of tyre. The arms and clips are enamelled black, and the price per pair is 10s. 6d.



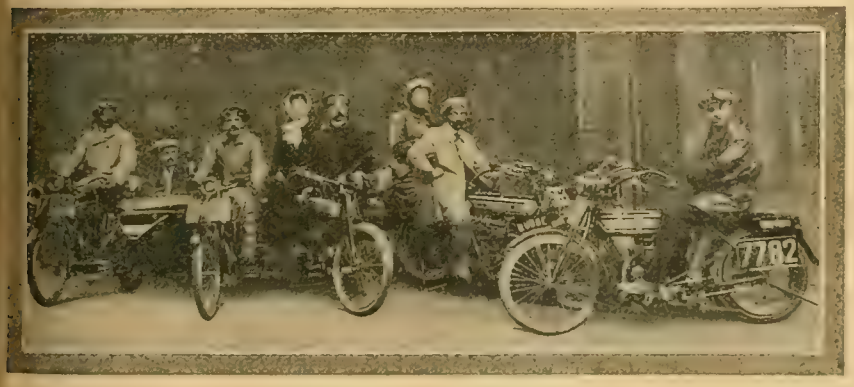
Sidecar spare tyre carrier.

The E.I.C. Mixture Detector.

A rapid and fairly accurate method of tuning up a carburetter is to use a plug with a glass window, by means of which the colour of the explosion flame may be seen. The Electric Ignition Co., Ltd., of Sampson Road North, Birmingham, have just introduced a little device called the "Mixture Detector," which we illustrate. This consists of a T shaped adapter to screw into the valve cap, the sparking plug being screwed into the top of the adapter. The window is composed of a quartz glass plug $\frac{1}{2}$in. in diameter and $\frac{1}{4}$in. thick, fastened in the arm of the T by a gland nut, so that it is readily detachable. In the case of standard sparking plugs the points of the electrode can be seen, so that in case of a supposed failure of spark, if the engine be revolved over compression, while the points are watched, the strength of spark may be examined. The adapter increases the capacity by $2\frac{1}{2}$ c.c. only, so the compression ratio is not seriously affected; in fact, it is not appreciable when the adapter is used in one cylinder of a $2\frac{3}{4}$ h.p. Douglas.

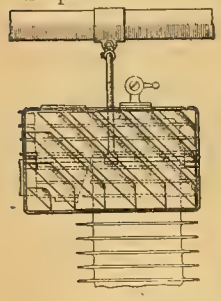
The E.I.C. "Mixture Detector."

The adapter may be employed for fitting an extra sparking plug, if it be wanted for double sparking. It is worthy of notice that inspection windows made of common glass, are dangerous, as when the glass gets hot, if water such as heavy rain fell on it, it would probably fly to pieces. The quartz glass windows used in the E.I.C. Co.'s mixture detector have been heated to a red-hot glow and immediately plunged into a bucket of water, when the distortion did not exceed one 1,000th of an inch.



A group of Belgian riders of Rudge motor cycles. In sending us this photograph, Mr. C. Holz, jun., who is at the extreme right of the picture, says "The Motor Cycle" is much appreciated in Belgium.

A Leg Shield and Air Deflector.

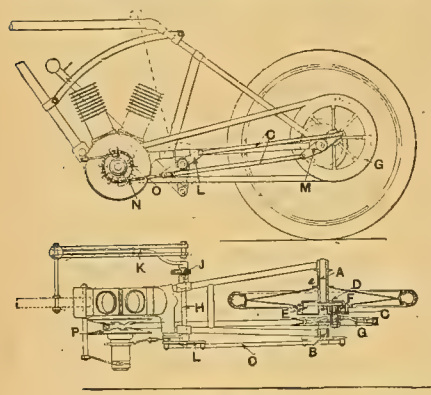


Suspended from the frame at each side of the engine is a baffle formed with louvres. This baffle acts as a leg shield, and the louvres are so set as to prevent heat being radiated on to the rider's legs, and also to deflect the air on to the hot cylinder. — Walton Maughan, No. 13,956, 1912.

PATENTS by Eric W. Walford A.C.I.P.A.

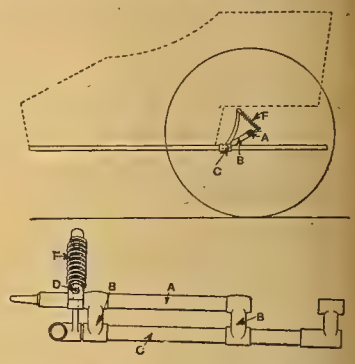
A Gradually Variable Drive.

In belt transmission, in which the drive is direct from the engine pulley to the rear wheel, it is usually necessary, in order to obtain a low gear, to employ a small engine pulley. The invention illustrated herewith comprises a gradually variable drive incorporating a reducing gear in the back wheel, whereby the employment of an extremely small engine pulley is obviated. The rear axle comprises two portions A B, each of which is cranked, the crank webs being connected by a crank pin C, which comprises two non-circular parts projecting one into the other. The hub D carries an internally toothed annulus E engaged by a pinion F carried by the boss of the driven belt pulley G, which, as will be seen, is mounted on the crank C, and is thus eccentric to the rear wheel. Mounted in the frame of the machine is a shaft H, one end of which carries a pinion J engaged by a sector on an operating rod K. Fixed on the shaft H is a lever L connected to a corresponding lever M on the rear axle part B by parallel links C; and it will be seen that movement of the rod K will rotate the shaft H, and rock the levers about their pivots. This rotates the cranked axle A B, moving the centre of the rear pulley G nearer to or from the engine-shaft. Simultaneously with this movement, the engine pulley is adjusted by a chain N engaging a chain wheel O carried by the movable pulley flange P, which is mounted upon inclined planes on the boss of the fixed flange. It will thus be seen that, as the engine pulley is varied, the eccentricity of the rear pulley G takes up the belt slack, whilst the drive to the rear wheel is through the reducing gear consisting of the pinion F and annulus E.—C. J. Bamford, No 10.754, 1912.



The Rollo Sidecar Suspension.

In this spring suspension the sidecar axle A is mounted by means of links B on a transverse member C of the frame. Between a projection D on the axle and a strut on the member C is arranged a coil spring F, and it will be seen that the wheel and axle A are free to rise and fall to absorb road shocks.—The Rollo Car Co., Ltd., and J. Farren, No. 20,749, 1912.



The Stag Engine.

The bore and stroke of the Stag engine, described in a recent issue, are 90 × 120 mm.

An Excellent Record.

We are informed by Messrs. A. J. Stevens and Co., Ltd., Wolverhampton, that the A.J.S. machine ridden by F. H. May in the A.C.U. Six Days Trials this year was bought second-hand in 1912, and that it had run for several thousand miles before it gained a silver medal, which is excellent testimony to the lasting qualities of these machines.

Henderson Improvements.

One of the most imposing-looking machines on the market is the four-cylinder Henderson. No doubt it would have become more popular for sidecar work if it had been fitted with a change-speed gear. Next year's model, however, will be so equipped, and a further refinement will be a very largely increased clutch surface.

New Zealand Trader's Visit.

We are informed that Mr. J. B. Clarkson, of New Zealand, who is well known in the cycle, motor cycle, and cycle car trade, is about to pay his annual visit to this country, and that he will arrive in England about October 20th. This information may be of interest to some of our readers. Mr. Clarkson's address whilst in England will be: London, c/o 1st Avenue Hotel, Holborn; Birmingham, c/o Messrs. Keep Bros., Ltd., 35-36, Great Charles Street.

Lady Godiva Mascot.

Mr. R. B. Harwood, of the City Garage, Coventry, is putting on the market shortly a neat mascot. This consists of a plated rod about 4in. long and plated clip for attaching to the handle-bar. At the top of the rod is fixed a small silk flag with a sketch of Lady Godiva on horseback woven into it. The prices will be 1s. 6d. (small size) and 2s. 6d. (large size). The mascot we saw was attached to an A.A. badge. It will also be sold for attaching to the radiator cap of cars.

The Dunlop Challenge Golf Cup.

On 3rd October the competition for the Dunlop Golf Cup will be held for the fifth year on the Coventry Golf Club's links at Finham Park. This event is open to golfers in the cycle, motor cycle, car, and allied trades. Quite a festive day is spent, for after the competition has been played off a dinner is held in the evening at the Masonic Hall, Coventry. Intending competitors should send in their names as soon as possible to Mr. Alfred Bednell, 13, Queen's Road, Coventry.

Bradbury Twin Cylinder.

The dimensions of the new model twin-cylinder Bradbury illustrated and described in our issue of September 4th are 74.5 mm. bore and 86 mm. stroke giving a cubical capacity of 749.75.

A Bosch Novelty.

We have received from the Bosch Magneto Co. a small mirror mounted in celluloid, which is designed for examining the contact-breaker of a Bosch magneto, which is sometimes placed in an inaccessible position. These mirrors can be obtained from the Bosch Co., price 2d. each.

Catalogues Received.

An attractive catalogue has been received from the Metropolitan Machinists' Co., Ltd., who have a large stock of accessories of general use to the motor cyclist.

A catalogue of accessories useful to the cycle carist has been received from Barker's Motor Dept., Kensington, W.

The Stepney Spare Motor Wheel, Ltd., has sent us a catalogue for 1914.

Races in Finland.

Particulars are to hand of motor cycle races recently held at Aggleby, Helsingfors, Finland, in which British machines, as usual, performed well. The Humber particularly distinguished itself, winning the class up to 2 h.p. and also that up to 4 h.p., in addition to the Special Prize of Honour for the machine which accomplished the most meritorious performance and made fastest time.

"SERVICE" BELTING.
BRITAIN'S BEST.

The no-trouble belt, always grips, never slips; most flexible belt made. Best for sidecar and cycle car. All genuine "Service" Belts stamped on every link. Patented 1956/10.

BRAMPTON VARIABLE GEAR

The Successes of riders using this gear afford conclusive proof of its efficiency and reliability. Those of Mr. H. Newman are typical:—

3rd place in the Junior T.T. and 3rd and 5th Fastest Laps, 7 successes in Hill-climbs and Reliability Trials during the last year.

The Brampton gives seven speeds, free engine, and a positive drive in all weathers. It is simple, easily operated, and can be fitted to practically all engines where the boss does not necessitate a recess in pulley flange of more than 7/16th in. deep.

The Brampton Variable Gear is both a convenience and an economy, for it enables a medium powered machine to do the work of a high-powered one, and to take hills and negotiate traffic with an ease that would be impossible without it.

Crower Square, Matlock,
July 8th, 1913.

Dear Sirs,
I am highly delighted with my Gear. I have run about 2,000 miles since I put same on machine. She grips perfectly on hills, even with Sidecar attached. For traffic work it is absolutely ideal.
S. FEARN.

CYCLE CAR The Sensation of the Year!

A wonderful car of tried and proven reliability as the following letter from a well-known Midland Engineer shows:
August 19th, 1913. "I am taking this opportunity of writing to you about my experience with the car itself. At the outset you will be pleased to hear that I have had as much real pleasure and satisfaction out of driving the little car, as any motor vehicle I have had during the past 15 years. I have driven the car myself over 1,000 miles, and she has probably been another 1,000 miles with other drivers. I think it's a safe statement that she has never given a minute's anxiety or trouble on the road."

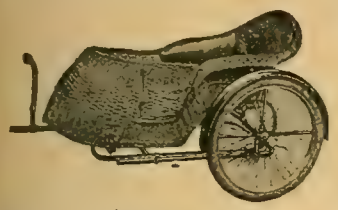
PRICE, with smart two-seater body, side and tail lamps, **£105.**

For full specification and other information write to:

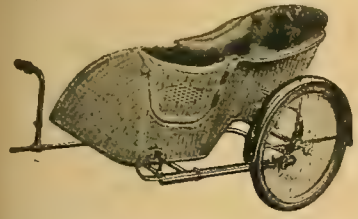
POLYRHOE CARBURETTERS, LTD., 144, Gt. Portland Street, London, W.

CORONET SIDE CARS

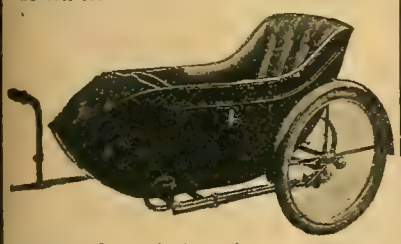
are correctly constructed to give the utmost satisfaction to users. The design is pleasing to the eye, and has no freakish look. Avoid risk of disappointment by specifying a Coronet, which are fully guaranteed and manufactured under the best possible conditions.



MODEL 9.—Underslung frame, body fitted with side door, sides and floor lined to exclude draughts. "Coronet" detachable joints. **£7 7s.**



MODEL 8.—Underslung frame, high-class reed cane body, sides and floor lined to exclude draughts. "Coronet" detachable joints. **£8 17s. 6d.**



MODEL 7.—Underslung frame, coach-built body, tool-box under front, also under seat. A real high-class sidecar. **£10 15s.**

SENT CARRIAGE PAID.
TRADE SUPPLIED.

TEE BEE SEAT-PILLAR
(for lowering seat).
Price 5/-.

This attachment is particularly suitable for improving the riding position of machines which are too high. It will be noticed that clearance is left for the peak of the saddle, which allows the saddle to be placed well forward.

The Druid

—the proved PERFECT Spring Fork

—It's the SCIENTIFIC DESIGN and PERFECT SPRINGING principle which places "The Druid" so far ahead of any other Spring Fork—that's the reason why it is adopted on the leading machines of the day—and the fact that it

was fitted on the majority of winningmachines in the A.C.U. SIX DAYS' TRIALS

is proof of its supremacy.

—The "Druid" eliminates all vibration, bouncing and road shock—ensures perfectly true steering—admits of no side-play whatever—and is *completely* effective in promoting the rider's perfectcomfortandsafetyawheel

—The "DRUID" can be fitted to any existing machine quite easily—write for our 'Booklet' containing full particulars.

A. DREW & Co.,
Leopold Street,
BIRMINGHAM.

—and fitted on the WINNING machine in the 1913 JUNIOR T.T. RACE.

SUPREME FOR SOLO AND SIDECAR MACHINES

R.H.Sr

£10-10-0

Ten guineas is all it costs to bring your mount up-to-date by the addition of the

1913½ ROC

SIDECAR PATTERN

Two-speed Gear.

(6 Days' World's Sidecar Record type)

The 1913½ big clutch type has been designed expressly for passenger work.

It solves all gear worries and guarantees you satisfaction.

The 1913 Roc gear was already recognised the last word in motor cycle gears for solo use.

The 1913½ big clutch type is just what thousands of "sidecarists" have awaited and expected.

The Roc gear was the first of all motor cycle gears—it is the first to-day. Nothing could be smoother, easier to operate, or be more reliable.

No better investment for the money is possible than in this 1913½ Roc dependable gear, fitted complete for ten guineas.

Write for particulars, stating make and h.p. of your machine.

No delay in delivery.

ROC GEAR Co.,

HAYMILLS, BIRMINGHAM.

London : Robertson's, 157, Gt. Portland St., W

Sidecar and Cycle Car Trials.

THE announcement that the Auto Cycle Union will hold next month a one day reliability trial devoted entirely to cycle cars, and, more important still, a Tourist Trophy Race for this class of vehicle next year, will be welcomed by those interested in this type of machine. The trials held hitherto have not been the means of attracting a really representative entry, as instance the Six Days event; thus in all probability a trial solely confined to this class of vehicle, in order that the performances cannot be overshadowed, may be more of an inducement to cycle car makers to enter their products. Incidentally, if the rules are properly framed, the October trial may, for the time being at any rate, overcome the difficulty in regard to the performances of three-wheeled cycle cars being ignored by the general public owing to their being relegated to a different class from the four-wheeler.

Undoubtedly the event, if well supported, will be the means of giving the cycle car movement a much needed fillip just at a time when new models are about to be introduced, but, as regards future trials, we should be sorry to see sidecars excluded as a regular course. What ninety per cent. of potential cycle car buyers want to know is which type of machine is most likely to suit their needs in respect of reliability, comfort, and low running costs—sidecar or cycle car?

There are now luxurious sidecar outfits on the market which exceed £100 in cost, and they are, too, being sold in considerable numbers; their owners cannot have overlooked the claims of the light four-wheeler before making their choice, consequently we would prefer to see future trials open to sidecars and cycle cars until there is nothing to choose between the general body of them in respect of reliability, hill-climbing, and all round excellence. Then the buyer who has £100 to £150 to spend on a reliable passenger machine will be able to make his choice with safety and with the comforting knowledge that he has invested in the most satisfactory type of vehicle.

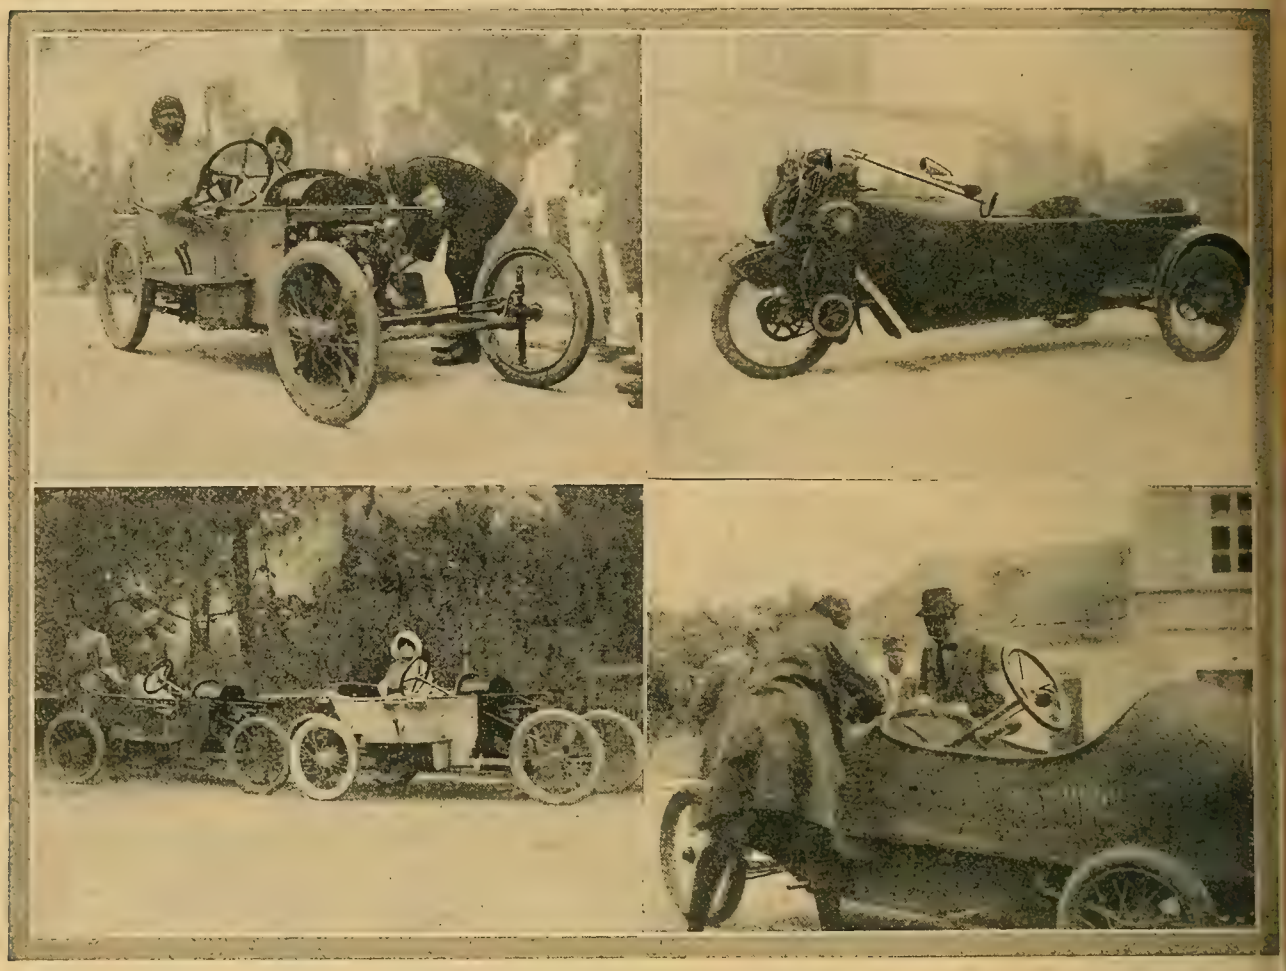
Next year's Isle of Man race is just the thing needed. Attempts have been made to organise a cycle car race in these Isles this year, but it was felt that the time was not ripe for such an event. By the end of next summer, however, there is every prospect that a good entry and a successful race may be arranged, for larger firms are now taking an interest in the miniature car, and next year will undoubtedly see a great increase in the ranks of cycle car owners. In the preliminary announcements of next year's race, no mention is made of sidecar combinations, but it is to be hoped that they will be admitted for the lessons of comparison already mentioned. After all, sidecars would be out of place in the popular motor cycle race in June, but it is only right that sidecars and cycle cars should race together in the autumn. The French Grand Prix proved that such an event can be made a success, and, if in France, why not in Great Britain?

An Undesirable Practice.

WHILE we should be the last in the world to say anything that may militate against the proper use of motor cycles or to countenance any move antagonistic to the enjoyment of the pastime, we feel it our duty to speak our mind freely against a practice which, although of comparatively recent growth, has become enormously popular within the last twelve months; we refer to carrier riding. A year or so ago this use of the carrier was in its infancy, but of late there has been an enormous tendency to substitute a living freight in place of the load for which the carrier was primarily designed. The danger lies in several directions. The strain on the rear tyre is tremendous, the carrier is usually loaded far beyond its proper margin of safety, and skidding, if a wobble occurs, is apt to be fraught with great risk to both rider and passenger; and as the passenger is all too frequently of the fair sex, the resulting smash, if anything goes wrong, is all the more unpleasant to contemplate. It is all very well to urge that the passengers are, as a rule, highly skilful in balancing; but everyone has to make a start, and it is in the first few rides that accidents are likely to occur. It is well-nigh impossible to correct a severe or even a slight skid unless the passenger is so perfectly in sympathy with the rider as practically to anticipate his movements. Already in some States of America the practice is forbidden, and the Americans are not the people to get in a panic over an odd fatality or two. A large number of accidents which have taken place this year can be attributed to the practice of passenger-carrying. No doubt, in the headstrong rashness of youth, many who indulge in this practice will put us down as alarmists, but we believe that the great bulk of serious riders will support us in our view that the practice is in the main undesirable, and few would shed tears at its abolition in this country.

Motor Cycles and Cycle Cars on Semmering Pass.

Observations at the Vienna Club's Annual Hill-climb.



SCENES AT AN AUSTRIAN CYCLE CAR HILL-CLIMB.

(1) Before the start. Sealing the engines in case of a protest being lodged against their rating.

(2) The Phanomobile in racing guise. It weighs five cwts. and has a four-cylinder 10 h.p. engine which is fan cooled and drives the single front wheel over which it is placed.

(3) Two of the competing Austro—N.S.U. cycle cars.

(4) Sealing the engine of the Globe prior to the race. The neat wicker body will be noticed.

THE Allgemeine Motorfahrer Verband of Vienna held its annual Semmering Hill-climb on the 14th inst., when under the eyes of thousands of spectators cycle cars for the first time appeared in this historic climb. Of sidecars there were none, as sidecarring nowadays does not enjoy much favour in Austria, owing to lack of modern variably-geared machines.

Our Austrian correspondent states that there was general regret that there were no English entries.

The best performance of the day was put up by Hellmuth Böhringer, on a Grand Prix Motosacoche.

The cycle cars, divided into a small and a big class, performed fairly well, although, of course, they were far slower than the motor cycles. The small car type cycle cars, although fitted with every modern refinement, did not score a victory, but this was not due to any shortcoming of this type of vehicle, but rather to bad tuning up of carburetters and instability when cornering fast in one or two cases. The Austro cycle cars, which were fitted with 6 h.p. air-cooled twin N.S.U. engines, behaved very well, and took the hairpins in good style. These little cars are chain driven throughout, and have four speeds, and their engines may be started from the driver's seat.

Not up to British Form.

Compared with British riders, the cornering work of both motor cycle trade riders and cycle car amateur drivers was very poor, some stopping their engines for quite a time on the hairpins. It is also interesting to note that only one of the air-cooled cycle car engines overheated on account of bad driving and fitting too large a jet, whereas all the other air-cooled engines worked splendidly in spite of severe gradients and constant climbing for ten miles.

On the straight bits tremendous speeds were shown by Motosacoche and N.S.U. 6 h.p. motor cycles, the rider of one of the latter, however, spoiling his chance by running over a dog not ten yards from the finish.

Motor Cycles and Cycle Cars on Semmering Pass.—

Of the cycle cars the Austros and one Globe were very stable, but the Phænomobil and the Wanderer, a tandem-seater of the small car type), were fast and driven at their speed limit, and whenever cornering were both nearly overturned.

The results were as follows:

MOTOR CYCLES.

Class I.—6 h.p., minimum weight 224 lbs.

	m.	s.
A. Hradelzky (2 N.S.U.)	10	44⅖

Walk-over.

Class II.—3-4½ h.p., minimum weight 168 lbs.

1. Hellmuth Böhringer (2 Motosacoche) ...	9	13⅖
2. F. Brosch (2 Moto-Rêve)	10	31
3. Hans Lager (4 F.N.)	10	30⅘

Class III.—2-3 h.p., minimum weight 112 lbs.

1. Karl Hradelzky (N.S.U.)	10	49⅘
2. Kellner (N.S.U.)	12	27⅗

Class IV.—2 h.p., minimum weight 80 lbs.

1. V. Preiner (Motosacoche)	15	19
2. Horak (Motosacoche)	15	21

CYCLE CARS.

Class I.—9 cwt. complete, up to 10 h.p.

1. Czerniel (4 Phænomobil)	12	39⅖
2. Rosenthal (4 Wanderer)	13	1
3. E. Bittner (4 Premier)	18	48⅘

Class II.—9 cwt., up to 7 h.p.

1. Count Kolowrat (Globe-Anzani)	13	17⅗
2. Edward Shlosser (Austro)	13	27
3. W Burchhart (Austro)	14	25⅖

International Definitions Disregarded.

As will be seen, the Austrian clubs have ideas of their own on cycle cars and motor cycle races, and manage their classes and limits quite regardless of the restrictions and agreements of the International Federation.

Another interesting item of this event was the general use of the single-geared machines among Austrian riders, who, it must be remembered, have to face the most severe gradients. Fully ninety-nine out of every hundred machines belonging to the hundreds of spectators lined up along the route or on the hairpins were possessed of but one gear.

Five Miles Sidecar Record Broken.

On the 17th September, at Brooklands, Kenneth Holden, riding a 3½ h.p. B.S.A. 85 × 88 mm. with sidecar and passenger, broke the five miles sidecar record, his time being 5m. 56s., equal to a speed of 50.56 m.p.h. The previous best time was accomplished by H. Riddell on a 3¾ h.p. Zenith-Green at a speed of 49.05 m.p.h. Holden's machine was shod with Continental tyres, and fitted with a B. and B. carburetter, and he also used a Pedley belt, Pratt's spirit, and Houghton oil.

Holden has also lately made determined efforts to annex the ten miles sidecar record, but has been unlucky, as he has been troubled with valve spring breakages, but he hopes to get over this trouble shortly.

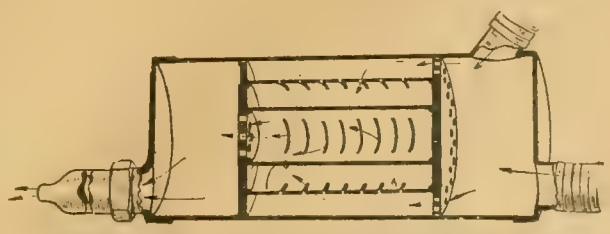
Simplicity v. Weight in Cycle Cars.

[T is a notable fact that the majority of the miniature cars have to undergo considerable weight paring to bring them within the cycle car definition. It is also noteworthy that the long-established firms of manufacturers such as the Wolseley, Singer, Humber, Alldays, Swift, etc., plump entirely for this type of machine. Undoubtedly the manufacturers find it practically impossible to build a light vehicle on standard car lines which shall yet possess the necessary strength and be capable of holding the road. I fancy that the difficulty of holding the road with a very light fast vehicle is as much responsible for the weight as is the necessity for strength, for with present-day high tensile steels strength without weight should be available even if a little more costly. Lately, in the course of conversation with the head of the test department of a large firm, I was told that a certain demonstration model held the road better than any model yet turned out, and this was attributed solely to a little extra weight in the way of ultra luxurious fittings. A trial proved this statement to be correct, but the weight of the cycle car, without passengers, was as near as possible half a ton. Also the designer very much doubted whether the chassis would come under the 6 cwt. definition.

Thus it would seem undesirable to reduce the weight if 40 m.p.h. is ever to be attained. If the car can reach 40 m.p.h., then sooner or later it will have to do so, in average hands, at any rate, for the man who can jog along at 25 m.p.h. indefinitely when 35 or 40 m.p.h. is possible is a *rara avis*. The light simple vehicle has the advantage of lower running costs, but if the designer cannot produce stability at every possible speed then the speed should be limited by engine power. For the vehicle which has a maximum speed of, say, 30 to 35 m.p.h. I do not think there is a great future; it may content the beginner, but not for long.

Thus we have our choice of a light simple vehicle which does not hold the road at high speeds, or a weightier model which will hold the road, although it will cost more for petrol, tyres, etc. There is the question of first cost, of course, but few of the simple type cost under £100, and many of the miniature cars are not more than £150. The luxurious models from £150 to £185 are rather a bigger step, but the difference between these and what we may call the intermediate class is merely a matter of increased comfort and luxury. In the end I think the heavier type, the miniature cars, will probably hold the greater part of the market, even if they do not already do so.

NORSEMAN.



A neat silencer fitted to the new model 5-6 h.p. Hazlewood. It is connected to the forks by flexible tubing, and though there is said to be absolutely no back pressure the issuing gases are rendered very quiet.

AUTO CYCLE UNION NOTES.

Annual Dinner during Show Week. A Cycle Car T.T. in the 1914 Programme.

Annual Dinner.

IT is proposed to make the annual dinner this year a very important function, and to ensure a good attendance it is proposed to hold the dinner during the Olympia Show week. The details of the organisation are to be carried out by the management committee, who, for this purpose, are to be given power to add to their number.

Forthcoming Events. A.C.U. Permits.

Permits have been granted to the following clubs to hold reliability trials and hill-climbs:

September 27th.—Herts M.C.C. One-day Trial.
October 4th.—Sutton Coldfield and Mid-Warwickshire A.C. Reliability Trial.
October 4th.—Bristol B. and M.C. Speed Trials.
October 11th.—Coventry and Warwickshire M.C. Hill-climb.
November 1st.—Streatham and District M.C.C. One Day Trial.

The latter trial will be an interesting one, consisting, as it will, of a speed trial, an acceleration test, a starting test, as well as a test for reliability.

A Cycle Car Reliability Trial.

Messrs. Brooker, Greenhill, and the Secretary of the A.C.U. have been appointed to draw up the regulations for the cycle car trial to be held on November 29th. The route followed will comprise Boar Hill, Dorking, the Hogs Back, Charterhouse Hill, and the hill near Hindhead, all of which were included in the spring one-day trial.

The A.C.U. 1914 Programme.

The following rough outline of the 1914 programme has been drawn up:

The Junior and Senior T.T. Races will be held over the mountain course probably late in May or early in June.

A cycle car T.T. race over the old triangular T.T. course in September.

In addition to the above there will be held two one-day trials, one in the spring and one in the autumn, the Six Days Reliability Trials and the A.C.U. Championship Race Meeting.

It has also been proposed that a trial, or trials, should be held for motor cycles having engines not exceeding 150 c.c., so as to encourage the development of the ultra-lightweight and the attachments for pedal cycles.

The next meeting of the Fédération Internationale des Clubs Motocyclistes will be held in Paris at the Automobile Club de France at 5.30 p.m. on October 25th, at which the International Competition for 1914, classification, and other points will be discussed.

The 1914 One Day Trials.

Of the two one-day trials to be held in 1914, one will probably be organised for motor bicycles and the other for sidecar combinations and cycle cars.

The Cycle Car T.T.

It is suggested that this proposed race should be held on the old and more easy motor bicycle T.T. course in the Isle of Man, from St. John's to Ballacraine, thence up Creg Willey's Hill to the acute corner at Kirkmichael and back to St. John's *viâ* the Devil's Elbow and Peel.

Three-wheeled Cycle Cars.

It may not be generally known that all international competitions must be run under the rules of the F.I.C.M., which classifies together all three-wheeled motor cycles. *Motocycles* as they are called in French as opposed to *motocyclettes* which we call motor bicycles. The F.I.C.M. therefore includes three-wheeled cycle cars in the *motocycle* class. Now the prominent makers of three-wheeled cycle cars do not object to running in competition with sidecar combinations, but they do strongly object to be excluded from the four-wheeled cycle car class. In fact, in the recent A.C.U. Six Days Trial results, there was a distinct tendency to overlook the performances of the three-wheelers, which were, so to speak, lost among the sidecar machines, while the four-wheelers were conspicuously placed in a class by themselves. To put the three-wheelers in a separate class would seem to be an easy matter until an attempt is made to define a sidecar combination. It may be said that the latter is a three-wheeled motor vehicle consisting of a motor bicycle fixed to a readily detachable frame bearing one road wheel and a body, but when it is remembered that certain combinations have been made undetachable the definition falls to the ground. However, the A.C.U. will have to hit upon a reasonable solution to put before the Fédération Internationale before the forthcoming meeting in Paris.

Membership.

The increase of members during the last two months has been most satisfactory. At the last meeting 727 touring members, five full town members, and forty-five full country members were elected. Two new clubs, the North Allerton M.C.C. and the West Hants. M.C.C., have become affiliated, and the total increase for the two months amounts to 808. The total membership of the Auto Cycle Union now approximates 14,000.

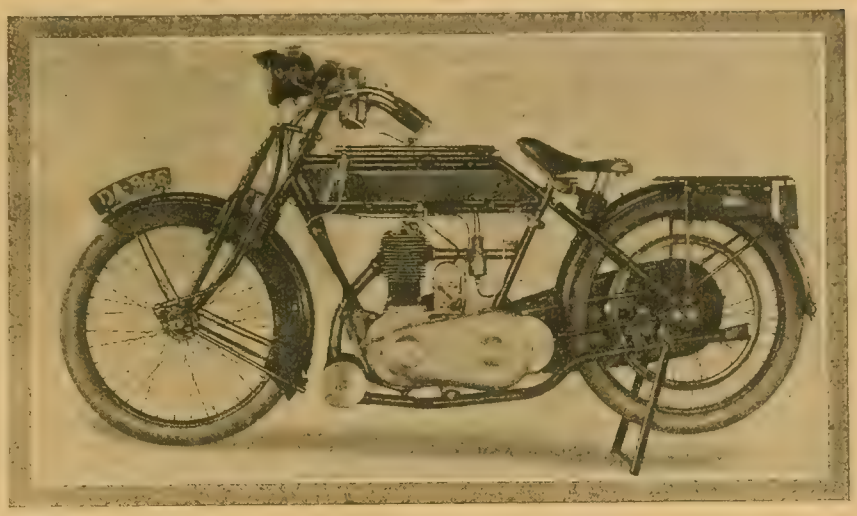
A 3½ h.p. 499 c.c. SUNBEAM.

FEATURES: 85 × 88 m.m. engine, three-speed gear-box, and oil bath chain cases.

THE 3½ h.p. 1914 pattern Sunbeam is, as our illustrations show, an enlarged replica of the now popular 2¾ h.p. model. The machine embodies all the desirable features which have helped to make a name for the little Sunbeam, including chain transmission enclosed in oil bath cases, but it has the additional advantage of a three-speed counter-shaft gear.

The new engine is of the popular measurements 85 × 88 mm., giving a capacity of 499 c.c. A striking feature of the cylinder is the large radiating fins to give effective cooling, which is assisted by the arrangement of an air passage round each valve pocket. The main shaft is mounted on Hoffmann roller bearings, two being placed side by side on the driving side and one on the timing gear side. The piston, which is drilled both for lightness and to assist lubrication, has a flat top, and has two rings in the orthodox position. The connecting rod is a steel stamping machined all over, the big end being fitted with a Sunbeam roller bearing, while the top end has a phosphor bronze bush. The gudgeon pin is a driving fit. The valves, which are of ideal shape with a gradual curve from the head to stem, are interchangeable, and measure 1⅜in. diameter over the head, which should spell efficiency. Valve troubles are practically unknown with Sunbeams, it may be interposed. The exhaust pipe is of 1½in. diameter, and the expansion chamber and extension pipe are of the same generous dimensions. As regards the timing gear, external cams are used, operating the spring adjustable tappets through valve rockers. There are but three wheels, all placed in line. By the simple expedient of recessing the tappets the escape of oil from the exhaust valve tappet (a common and vexatious trouble with many engines) has been entirely overcome. Indeed, the cleanliness of the Sunbeam engine is one of its most commendable features. At the rear of the cylinder and so protected from the elements the magneto is mounted on a platform cast integral with the crank case. It is driven by a train of three wheels, the large one in the centre being mounted on a double Hoffmann bearing.



A feature of the 1914 model 3½ h.p. Sunbeam is the sound method of entirely enclosing the transmission in oil bath chain cases, as the above illustration amply shows.

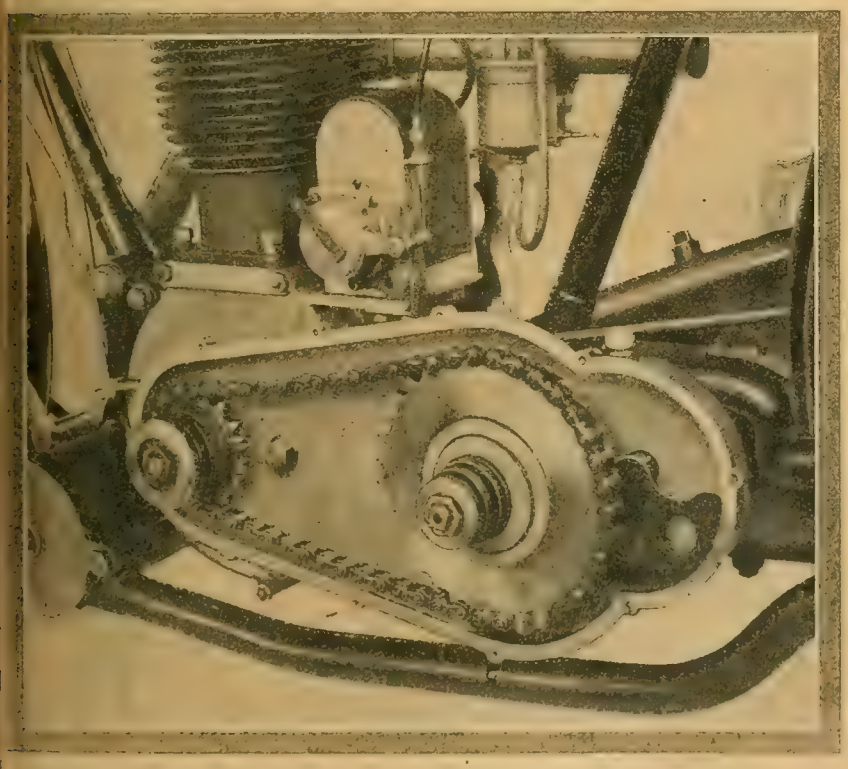
The gear box is a particularly neat job identical in design with the box adopted on the 6 h.p. twin sidecar combination, which we dealt with in our issue of June 5th, but slightly smaller. It is operated through a gate change lever affixed to the top tube, the changes being effected by sliding dog clutches.

A multiple plate clutch operated by a lever on the handle-bar is used, the plates measure 5in. diameter and are alternately of steel and phosphor bronze. There are five phosphor bronze plates and four of steel. It is the large bearing surface thus provided that accounts for the smooth operation of the clutch.

Staunch Design.

Nothing is left to chance in the design of Sunbeams, and where there is a doubt about any portion being up to the required strength, the designer has always erred on the heavy side. An instance of this is the size of the driving chains, which are ⅝in. pitch, ⅜in. wide, stronger really than the chain makers recommend. The result is that after the first test run which extended to 2,000 miles, only half an inch sag was noticeable on the engine chain.

Adjustment of the chains has, of course, been provided, for the rear chain can be tightened in three or four minutes. The cases are divided horizontally, and can be removed after with drawing a couple of screws.



Transmission from engine to counter-shaft on the 3½ h.p. Sunbeam with cover removed, showing the slipping sprocket on engine-shaft.

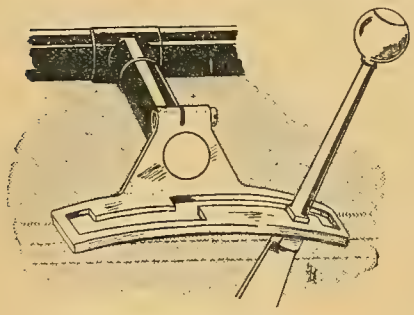
A 3½ h.p. 499 c.c. Sunbeam.—

The bearing for the kick starter shaft on the new 3½ h.p. model consists of an extension of the box instead of a separate unit as formerly.

Tyre repairs have been simplified by the provision of a rear axle in halves which means that a tube may be changed without removing the back wheel from the frame. A Best and Lloyd drip lubricator is used. Another desirable feature is the usually wide rear mudguard which, however, is removable together with the carrier by the withdrawal of three nuts.

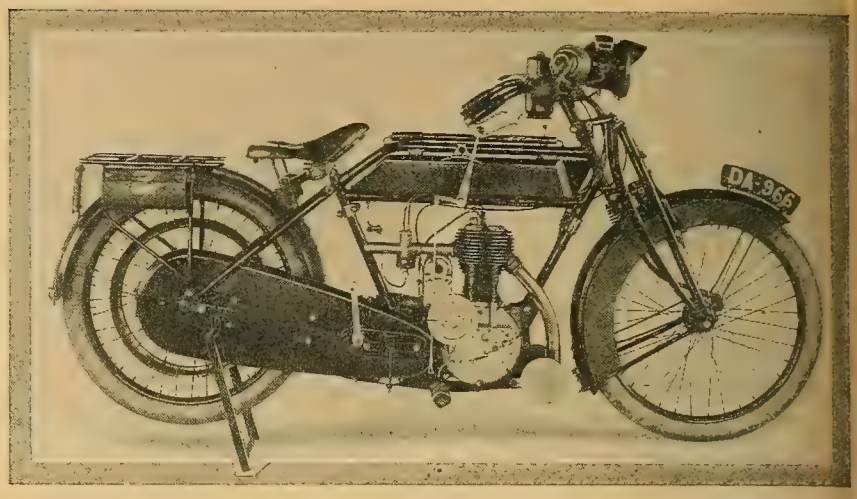
A Trial on the Road.

We have lately had the pleasure of sampling the running of one of these machines, the makers kindly offering us the loan of a bicycle or sidecar outfit. Our choice lay in the latter, the talented designer, Mr. J. E. Greenwood, accompanying us on the trip. A taste of the Wolverhampton traffic and network of tramlines served to bring out the complete controllability of this taking machine. With the excellent plate clutch provided, and by means of the handy gate change, one could crawl in and out of the traffic, and tick along behind tramcars with the greatest ease, the engine all the time turning over silently and at a



The neat gate change speed as adopted on the 3½ h.p. and 6 h.p. three-speed Sunbeams.

low speed ready to respond in a second to a touch of the throttle lever. The 3½ h.p. model is bound to appeal to that large section of readers who require a



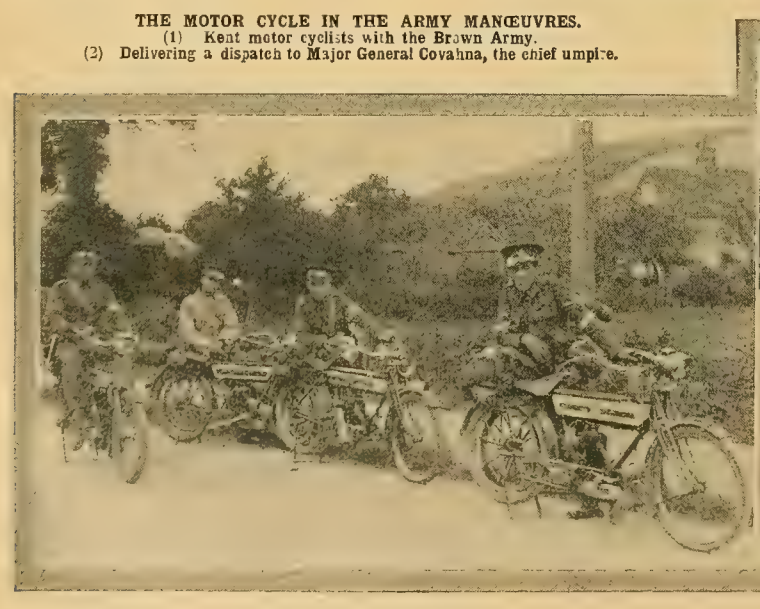
Valve side of the new 3½ h.p. single-cylinder Sunbeam.

machine capable of taking a sidecar on occasion, and yet is in itself not too heavy or unwieldy for solo use. It is fast on the level, a wonderful hill-climber, and, above all, the engine is splendidly balanced—a feature we have previously referred to in connection with the 2¾ h.p. mount. The particular machine that we tried had, as it so happens, been fitted with a new cylinder the day before we came on the scene, and the rings had not got properly run in, with the result that the engine pulled up suddenly on two occasions, but this only occurred when forcing the machine along to test what it really would do. It was no doubt the piston sticking, a quite common experience among testers. The remarkable part is that after pulling up, the engine will start straightaway again as if nothing had happened.

A High Speed Engine.

The engine is capable of turning over at an extremely high speed, 4,000 r.p.m. being quite usual for Sunbeam engines, but this high rate of revolutions is not obtained at the expense of slow running, for flexibility is a striking feature of these well-designed machines. A point we have noticed and have appreciated on both the single-cylinder Sunbeam is the absence of effort in the engine. One can bowl along at twenty miles an hour hardly without feeling the engine. The gear ratios appear to be splendidly proportioned, for a 4.9 ratio is used for the high, 8.5 for the middle, and 13.5 for the low gear. Not only is the exhaust of the 3½ h.p. as silent as any standard motor bicycle on the market—thanks to the extremely large silencer with its long extension pipe to the rear—but there is a notable absence of valve chatter. Indeed, we do not recollect having ridden a single-cylinder machine on which the valves function so quietly. With a petrol capacity of one and a half gallons and a quart of oil, it will be seen that the 3½ h.p. Sunbeam has been carefully considered throughout, and should prove an excellent mount, for solo or sidecar use.

THE MOTOR CYCLE IN THE ARMY MANŒUVRES.
(1) Kent motor cyclists with the Brown Army.
(2) Delivering a dispatch to Major General Covahna, the chief umpire.



Securing Spring Filler Caps.

A correspondent who endorses my complaint anent loose tank stoppers makes a helpful suggestion. The stoppers on his tank have a spring bayonet joint, and jump off when the shock of a bad road bump momentarily compresses the spring. He has packed the springs up with a small extra washer, and has prevented the stoppers flying off spontaneously, though they are still easily released by the fingers.

"Free Engines" that are not "Free."

I fancy that only a minority of motor cyclists have acquired the habit of coasting down gradients with the clutch out and the engine stationary, nor do I wish to encourage the practice, because a heavy motor bicycle, which is genuinely "freeling," cannot safely be stopped in a short distance with good brakes, and may be quite unstoppable on a really bad hill if the brakes are inferior; furthermore, many owners habitually overdrive their engines, and the occasional coasts with the exhaust valve up give the engine a chance to get its breath again. Nevertheless I desire to comment on the fact that very few motor cycles run really "free" with the clutch disengaged. I was rather disgusted to find that the ordinary push bicycle could "freel" clean away from both my first class 1913 mounts: each of them obviously suffered from gross friction when the clutch was nominally disengaged. One of these machines is fitted with a famous three-speed hub, in which the clutch is incorporated, while the other has a multiple disc clutch of the self-contained variety. Adjustments of the two clutches brought about a slight improvement, but neither of them could hold a pedal cycle for speed under such circumstances. The next thing was to overhaul the wheel bearings, and here again I was able to discover and remove a little friction: but the push bicycle remained my master. Inexperienced competition riders should make a note of these experiences. It is no use tuning up an engine to give a few extra "revs." if wheel bearing friction is sopping up the extra efficiency.

The Counter-shaft Gear Box.

A prominent shell in the battery of both sides of this controversy has to do with the wear of the short chain from the engine to the counter-shaft. As soon as the matter pops up, A asserts that his short chain has run 5,000 miles without being oiled, and B complains that he has to renew his short chain every other week or thereabouts. The solution of this contradiction appears, from my own experience, to be excessively simple. The wear depends very largely on whether the machine has a large thumping single-cylinder engine or a well-balanced twin-cylinder of small dimensions. I have recently owned two large single-cylinder machines with chain drive to the counter-shaft, and try as I would I never obtained a tenth part of the mileage from the front chain which the makers and the glowing testimony of a few users had led me to expect. In each case, the chain required very frequent adjustment and attention for the first month: after that period, the initial stretch seemed to have departed, and the chain ran fairly steadily, though it was already out of pitch and noisy. Before long, any fastidious owner would think it essential to fit a new one. With a miniature twin the case was entirely different. The front chain lasted a very passable distance indeed, particularly if it was either encased or regularly removed and lubricated. Of course, the efficiency of the shock absorbing device and the accuracy of its adjustments have an important bearing on the matter. But experiences of the behaviour of such chains under the stresses of a big single and a small twin are as far asunder as the poles.

The Running in of Engines.

Factory practice in the way of "running in" new engines must vary tremendously. My 1913 riding has largely been confined to two single-cylinder engines produced by two well-known factories of standing and repute. The first was delivered in a very stiff condition, and it was not until it had covered 2,000 miles that it really began to "rev." The other ran exceedingly well when it was first delivered, and its behaviour has neither improved nor deteriorated to any appreciable extent in a similar mileage. Judging from the experience of other riders of the same machines, my experiences are typical, and they result in a very dogmatic moral. Either the one factory assembles its engines with too small a clearance everywhere: or, alternatively, the other factory allows more clearance or gives every engine a long spell on the bench, until every part is thoroughly bedded in. I cannot help thinking that an engine which cannot be run in under 2,000 miles is a disgrace to its makers. Why should an unfortunate rider be condemned to ride for half a season before his engine is really in good training for hill-climbing and speed work? One of these engines accompanied a private rider to the Isle of Man for the T.T. It had a variable gear with a low ratio of 12 to 1, and it had covered 1,800 miles before he visited the island. Yet it invariably conked out on bottom gear before reaching the summit of Snaefell from either side, simply because all the moving parts were far too close a fit against each other. There would be some excuse if these engines wore noticeably better than any others, but as far as I can judge both engines require new bearings after an equal mileage.

The Golfing Motor Cyclist.

This week has brought me quite a novel enquiry. Do I know any accessory dealer who supplies a set of fittings for mounting a set of golf clubs upon a motor bicycle? I presume the enquirer hopes to hear of fittings similar in character to those used for mounting a rifle on a bicycle. Such an accessory has been marketed, but its sale was not pushed. Unfortunately caddie bags are not standardised as rifles are. Most motor cycling golfers take their clubs to the links by slinging the caddie bag across their shoulders.

Automatic Carburetters and Flexibility.

I can hardly agree with some of our correspondents that automatic carburetters are essential to the highest potential maximum of flexibility, and the analogy drawn from motor cars is probably misleading, seeing that most car engines have at least four cylinders, and their price limit permits a greater expenditure upon the carburetter. I admit that a bad driver will get more flexibility out of an automatic carburetter, and for that reason I think automatic carburetters are bound to come. But a good driver can probably obtain a slightly higher degree of flexibility from a first rate two-lever device at the present moment. At any rate, if I were competing in a flexibility trial, I would rather use one of two or three standard two-lever devices adjusted for the end in view than any automatic carburetter with which I have experimented up to date. In spite of this opinion, I hope to see automatic carburetters universally adopted on the ordinary tourist machine, because not one in a thousand can drive well enough to make the most of a two-lever device.

Two-step Drives and Sidecars.

Now that the sidecar has so triumphantly vindicated itself as a thoroughly practicable passenger machine, despite competition from cheap cars, it is interesting to notice how the budding 1914 types will improve the lot of the sidecarist. The growing popularity of twin-cylinder engines will reduce knocking and render gear changes less frequent; the two-step drive will minimise the number of roadside stops due to transmission troubles, especially in bad weather; the increase in the number of counter-shaft gears will render the back tyre, trebly accessible; and a slight but marked tendency towards the increase of engine power on variably geared tourist mounts, trending from 500 c.c. up towards 750 c.c., will provide the sidecarist with more engine power at a very slightly increased price. For all these reasons the sidecar should enjoy a quite abnormal boom in 1914.

ITALIAN MOTOR CYCLE CHAMPIONSHIP, THE CIRCUITO DI CREMONA.

(1) Carlo Maffeis (Moto-Reve), winner of the 500 c.c. class.

(2) Vailati (Rudge), who, it will be remembered, rode in the Senior T.T. Race last June, rounding a bend.

(3) A Douglas rider—Belfante—at the first bend after the start.

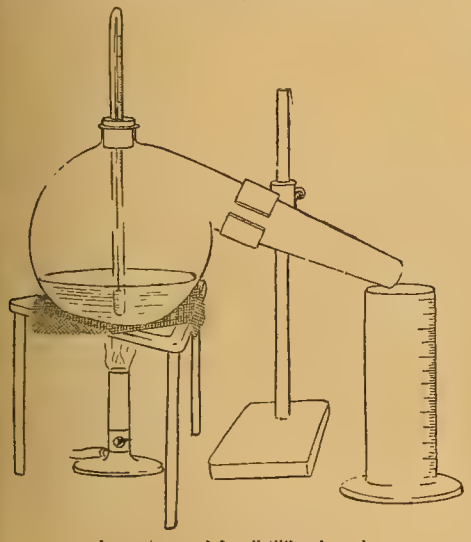
(4) The victorious Brothers Maffeis. Left Carlo, winner of 500 c.c. class, who rode a Moto-Reve. Right—Miro, winner of 350 c.c. class, who rode a (Douglas).

HOW TO TEST BENZOLE.

BENZOLE is increasing rapidly in popularity as a motor fuel, and hitherto its use has been limited to acting as a solvent for waxes, fats, gutta-percha, etc., and in the preparation of aniline dyes. For this purpose various grades have been put upon the market, which, although quite good enough for their early purpose, are not all quite satisfactory as a motor spirit. In these circumstances, then, it is desirable to have some simple method of testing the spirit to see if it can be used. A correspondent to *The Motor Cycle* asked me for details, and I propose here to describe a few experiments, some of which can easily be performed by any amateur chemist.

The Composition of Benzole.

In the first place, let us consider what benzole is. In the process of coal tar distillation a light oil passes over. This is collected either till the temperature of distillation has risen to a certain definite figure, varying in different works, or while tests periodically taken show that its gravity is less than that of water.



Apparatus used for distilling benzole.

This is the more general practice. The light oil is then washed to get rid of bases and acids, the former, consisting of pyridine and its homologues, by means of washing with sulphuric acid, and the latter, carbolic and cresylic acids, by washing with soda. These are recovered subsequently. The remaining liquid is fractionated and the various fractions collected. First of all comes benzole, then toluole, solvent naphtha, and a residue. Benzole is thus free from pyridine and carbolic acid, but the things it cannot easily be free from are volatile compounds which distil over with it. The chief of these are carbon bisulphide and thiophene. Carbon bisulphide being a heavy substance, a small quantity of it affects appreciably the specific gravity of benzole, and consequently as a large amount of it is bad for the purpose we are considering, a measurement of the specific gravity will give a strong indication of the merits of the benzole. 90% benzole is the best used, obviously by being more easily vaporised than 50% or 30% spirit. 90% benzole should have a gravity of .880-.883, 50% from .873-.875, and lower grades from .870-.872. These figures may come as a surprise to many, as they show that the lower the gravity the less volatile the spirit, whereas the opposite might be expected. These figures all refer to a temperature of 60°F. I take them with an ordinary hydrometer, reading from .850-.900, and then correct for the temperature of the liquid allowing .0005 for every degree Fahr. between the observed temperature and 60°F. If the reading is above 60°, then the correction must, of course, be added; if below 60° subtracted. The outside figures have been given, as 90% benzole varies in composition according to the way the tar is prepared; personally, my benzole is always .882 or .883 or between those figures.

The second experiment I usually do is a distillation test. This requires a little more apparatus, but is very easily done. 100 c.c. are measured out in a graduated cylinder and poured into an 8 oz. retort, a thermometer is fitted inside a cork, and the cork placed in the tubular opening at the top of the retort. The thermometer is placed so as to be in the liquid about ¼in. from the bottom. The liquid is then distilled by means of a bunsen burner or a spirit lamp so that it comes over in drops and not in a continuous stream. The temperature at which the first drop leaves the neck of the retort is noticed, also the amount at 84° C. and at 100° C. A good 90% benzole will start at 83°, about 4-5% at 84°, and not less than 90% at 100° C. The easiest way to measure the quantities at these temperatures is to let the spirit drip back into the 100 c.c. measure.

Sulphur in Benzole.

The only other thing in benzole that interests the motorist is the amount of sulphur, and, unfortunately, there is no quick, easy, and accurate way of testing this. The method usually adopted is to burn the benzole very slowly by mixing it with alcohol, or else by blowing air through some benzole held in cotton wool. The sulphur turns to sulphur dioxide, and arrangements are made for this to be done in a stream of ammonia gas, whereby ammonium sulphite is produced. This is passed up a tower, cooled, and collected; it is then oxidised with a few drops of hydrogen peroxide, and the sulphate precipitated as barium sulphate and weighed. This test when done has shown the benzole I use to contain under 100 grains of sulphur to the gallon, and as the Petrol Substitutes Committee consider anything under 300 grains to be satisfactory, I must conclude that my benzole is very good in this respect.

Apparati.

Perhaps a word as to the cost of the apparatus mentioned may be of interest. A hydrometer reading from .850-.900° costs 1s 6d., an 8 oz. retort 7d., a 100 c.c. graduated measure 1s. 4d., a Centigrade thermometer reading up to 110° 1s. 3d.-2s. (according to whether a paper or milk glass scale is used), a Fahrenheit thermometer reading to 100° or 150° 1s. 3d., a tripod stand to rest the retort on 4d., and a wire gauze 3d. A spirit lamp would come to 8d. or 9d. A cheap retort stand and a small clamp can be bought for 2s. The whole apparatus as outlined would not cost more than 10s.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Carburetter for Scotts.

Sir,—I am, like Mr. George Bax, a Scott rider, and am on the look out for a carburetter. Mr. Bax is in favour of the Lukin, and states that he has been able to do away with the half-compression valves. I should like Mr. Bax to tell me how he is able to start his engine under these circumstances. On my machine, a 1913 model, I could stand on the kick starter against compression, and it would be utterly impossible to start my machine unless I used the half-compression device. H. MACAULEY.

Sir,—With reference to Mr. Bax's letter, I think it would have been better if this gentleman, if he found any irregularity with the carburetter, to have written to me asking for some explanation, and it is more difficult to understand as all my carburetters are sent out on approval. Why, if it was not satisfactory, did he not return it in the time limit allowed? I cannot trace ever having supplied a carburetter to this gentleman, nor having received a letter from him. I have not the least fault to find with him for praising other people's goods, but, before making any public complaint, I think it was only due to me for such complaints to be made to me first, when I am sure the fault which he refers to in my carburetter could have been rectified.

As to the merits of my carburetters, as applied to the Scott, any owner can have one on approval and test it against any others he likes, and I shall be quite content to abide by the results. C. BINKS.

Military Motor Cyclists.

Sir,—May I be allowed space in your valuable columns to bring before the Motor Cyclist Reserve Committee a suggestion? I understand that the War Office request for motor cyclists for the Territorial Force has not so far been responded to in a satisfactory manner. Indeed, the headquarters to which I am attached should have an establishment of twelve motor cyclists, and up to the present I am the only one attached. Now, a condition is that for the whole period for which he is bound (which is one of four years) he will be required to "maintain a motor cycle." That, I take it, means that it must always be ready for mobilisation. The next condition is that, "to meet the expenses thus entailed," 8s. per day will be allowed when specially employed on military duty. Considering the high price of petrol, the heavy wear and tear incurred by such duty, and the higher rate of premiums required by the insurance companies for such work, I do not consider the allowance any too generous. In fact, it scarcely covers the cost of running the machine in manœuvres.

Now where is the inducement or compensation for maintaining the machine in good condition during the period of the four years? There is none. It might be argued that if a man has a machine he would for his own purposes so maintain it. If he be attached he must, but if not he is free to follow his own inclination or to act according to the condition of his purse.

Another suggestion is that the War Office pay a retaining fee, which I believe they do for large motor vehicles; in the case of motor cycles, say 20s. per annum. In addition to this the Army motor cyclist should be exempt from payment of the local taxation licence. The Territorial is free from payment of National Insurance contribution, but this is an advantage that will not apply to the majority of motor cyclists. I hope that some member of the Committee above referred to will see this letter, appreciate my points, and deal with them. G. M. COLBECK WELCH.

A Problem.

Sir,—I am rather puzzled with my machine, and think perhaps some of your readers could help me, and at the same time afford them an interesting problem to solve.

The machine is a 1913 model 3½ h.p. T.T. twin J.A.P. engine 70 × 64½ with overhead inlet valves. The trouble is that, although I can get 50 m.p.h. on the level for a short distance, it will not climb or pick up. The compression is good, cylinders clean, jet clear, plugs and lubrication perfect. I have tried a B.S.A. carburetter, also B. and B., and now have a Senspray, in which I have tried several jets; have also tested magneto timing and seen that the valve tappets have proper clearance. Several experts have tried the machine and made various adjustments but without effect.

[Our correspondent should have mentioned his gear ratio, which, we imagine, is too high.—ED.]

Hints will be much appreciated by TWIN JAP.

The Wear of Tyres.

Sir,—Having read "Ixion's" "Occasional Comments" in your issue of September 11th, I would ask your permission to give my experiences on some of the points mentioned.

Spare tube carrying. I do not agree with the statement that a spare tube must be carried by the "get there" type of rider. Perhaps "Ixion" would not put me into that class, but I am in the habit of using my machine for purposes in which punctual arrival at places considerable distances apart is essential; at times also it is necessary to hurry, and yet I have not carried a spare tube for three years. Previous to that I used to carry one, to find when the tube was urgently needed that it was either chafed through or perished. The only considerable delays, owing to tyres, I have had this year were on a loan machine unprovided with a special form of nail catcher always fitted to my own machines.

With regard to the 2¾in. tyre, I have not yet had sufficient experience of this size of cover to know if I am grateful to the makers. I fitted one to the driving wheel of my Triumph on August 1st, but its present life of 1,599 miles is not enough for comparison with tyres previously used. I think, however, that my luck with tyres must be better than "Ixion's." Of four heavy covers of one make, all used on the back wheel, three have given a mileage of 7,000, 8,000, and 6,176 respectively. The last one was particularly good. Fitted on November 17th last it punctured for the first time on March 21st, and was finally taken off on June 21st. Another cover, used on the driving wheel, completed 4,021 miles before being removed as too smooth for winter riding. The back tyre now in use on my other machine has done more than 4,200 miles. I ought to state that the above mileages are measured, not guessed. Freedom from tyre trouble is, I am sure, largely a question of the price paid. Economy in that direction is unwise. D. K. HALL.

Fair Treatment.

Sir,—Much has been said at various times about unfair treatment doled out by makers either by delay in despatching spare parts or refusing to accept liability on broken parts. As a rider of a 2¾ h.p. Royal Enfield, I relate my experience. My machine had been running remarkably well, when, by some reason which I cannot account for, the nut fastening the end of the gudgeon pin worked loose and so fouled the cylinder that it was beyond repair. I forwarded this, together with the piston, to the makers of the machine, and, to my astonishment, I was not only supplied with a new cylinder within three days, but was forwarded a new piston complete with rings and gudgeon pin and a new compression tap free of charge. Moreover, when fitting the

cylinder hurriedly. I discovered (too late unfortunately) that I had not bedded the same properly to the crank case, and, in tightening the nuts, cracked the new cylinder. I was obliged to approach the makers a second time, and in three days' time I received the second cylinder again free of charge. I might further add that I have no interest in the firm beyond being satisfied with the machine of their make and the treatment they have meted out to me. GEO. HARRISON.

Sir,—Funny, the diversity of experience on this subject; funny, also, that in a letter of praise the name of the firm should be quoted in full, while in the other sort it hides under "well-known make" or similar unsatisfying ambiguity. But the reasons are obvious.

My own experience is distinctly of the "other sort." Six months ago a friend and myself set up motor cycling, he preferring a lightweight and I a 3½. We were advised: "Get a—well a Pankhurst and a Lloydgeorge respectively, for they, if not the best, are at any rate the most popular; it will not be long before you require new parts, and whereas with a foreign or lesser-known machine you may suffer an annoying delay whilst they are procured, these makers keep these parts by the hundred, ready in stock for immediate delivery."

Sounded all right, so we acted upon it. Now for the proof of the pudding. At the start of my projected holiday tour, a month ago, my piston broke. I immediately took the machine to the nearest agent, instructing him to wire for a new piston and valves to the Lloydgeorge Company and let me get on.

These have only just arrived, on the last day of my holiday; and all fit so badly as to be useless. That is to say that after a month's maddening delay I am exactly as I started; very likely with a further month's wait, and the same result at the end of it.

On appealing to my friend for sympathy, he congratulated me on having the best of it, as he had to wait two months before the Pankhurst people condescended to execute his order for parts, similarly of standard make and quoted in their lists as stocked for immediate delivery.

This unbusinesslike slackness would not be tolerated in any other trade, and must do tremendous harm to motor cycling as a sport. Novices and enquirers have a wholesome terror of breakdowns, and with good reason, too, if a trouble that may come on at any moment is thus to deprive them of the use of their machine at the very time of the year they most want it. FED UP.

Sir,—I always read with interest the letters published under the heading "Fair Treatment." Personally, I have found that most firms of repute do their utmost to relieve motorists from embarrassing situations. The following, however, easily eclipses all, both for lightning despatch and generosity.

A few days ago, while riding a James sidecar combination, one of the timing wheels of this very excellent machine came adrift and caused much havoc. This happened in a tiny village (through which a professional tour was taking me), and which possessed nothing in the way of a satisfactory garage. The engine was taken down by lamp-light and repair on the spot found to be out of the question.

"THE FREAK HILL POLICY."

The above photograph shows "The Scar"—an exceptionally severe Yorkshire hill, between Augram reservoir and Middlesmore in Nidderdale—which had to be climbed during the Harrogate and District M.C.C.'s paperchase. E. Maynard (Triumph), the winner of the event, is seen negotiating the hairpin corner.

The ordinary delay experienced in repairs would have meant a serious loss to me, as my work took me into districts little served by railways. I therefore packed up the engine and put it on the first passenger train to Birmingham, at the same time despatching an urgent letter stating my position and the facts of my misfortune. Judge of the astonishment when I received a wire—"New engine despatched five-fifty Great Western passenger." Within a very short time we were at work, and I resumed my journey greatly rejoicing.

This is not an isolated case illustrative of the "push-ahead business-like" attributes of the James Co., and the true motorist will recognise their action as being a genuine desire to relieve the users of their machines from those unforeseen predicaments which are the lot and inheritance of all who participate in the glorious sport of motoring. I am utterly unknown to the James Co.

FREDK. PHILLIPS, B.Sc. (Lond.), F.C.P., F.C.S.

[We have devoted considerable space to this discussion, and the correspondence is now closed.—ED.]

Carburetters and Flexibility.

Sir,—Referring to "Autobore's" letter, I am afraid I cannot agree. I contend that the conditions of my test must be carried out without any alteration to the carburetter whatever, and to have to alter the size of the air port and the size of the jet whilst riding the machine is, to my mind, inadmissible. The machine that I would offer for test is, like your correspondent's, a T.T. fixed gear machine, and tests 2 and 4 which he says are impracticable on his machine would be practicable on my test machines, which would be fitted with Precision or Fafnir engines. C. BINKS.

Hub and Counter-shaft Gears.

Sir,—As a novice to the pastime, this being my first season, I much appreciate the opening of your columns to the discussion on three-speed hub gears, one of which is fitted to my 3½ h.p. single-cylinder Premier machine, which takes a sidecar practically all over Surrey.

The first season of riding as well as the correspondence in your paper on the subject has shown that the personal factor has considerable influence on whether hub gears are the best or of no use at all. Is it not conceivable that some of those who have had trouble with this mechanism are not treating it in the right way and would be better for a few lessons in driving and the care of the machine?

Personally, I never cease to wonder at the extraordinary way in which such a small engine and such light gears stand the racket of the work they are put to even under the best conditions of driving. LF 126.

Sir,—The letter in your issue of September 4th from Mr. E. C. Paskell seems to me to call loudly for correction.

If all hub gears are perfect, as he would make us believe, why did every morning's practice in the T.T. race this year see some number of machines hung up with gear trouble? There are very many people who do not look on the hub gear as thoroughly reliable, and most people also believe that the extra weight in the rear wheel does reduce speed and render steering more difficult.

It is just possible that a very skilled mechanic with all adjustments slack to begin with could take out the back wheel of the machine fitted with a hub gear and replace it within five minutes of the time taken with a more accessible wheel; but as a rule when a rear wheel is disturbed it is with the idea of changing a tyre, or something of the kind, and the dummy belt rim greatly complicates the matter.

Mr. Paskell has only to see machines which really have easily detachable wheels hung up with punctures to find that the owner prefers to drop out the wheel if the job is not difficult and complicated.

By the way, the designers of some machines appear to have got over the necessity of brake dodging in removing a rear wheel quite well without adopting counter-shaft brakes. RIFLEMAN.

Sir,—I am very pleased to see that in the 4th September issue the Armstrong Gear Company have at last come out of their shell and are replying to the various critics of the three-speed hub gears by facts and figures. I ride a New Hudson with one of these gears. I will not say I have had no trouble with it because I have had to send it back to the works once, but that was after about 2,000 miles. Then I suppose it was "familiarity breeds contempt," as, owing to it running so perfectly I ignored the makers' instructions regarding oiling and adjusting. The Armstrong Gear Company kindly repaired this for me free of charge, and on it I have since done about 2,000 miles, and up to the present it has given entire satisfaction. With me the gear gets plenty of work; it is not on the machine for ornament, and more often than not there are three up, and I never trouble about raising the exhaust lifter or throttling down when changing. Usual disclaimer. LF 93.

Sir,—I have been much interested in the correspondence *re* hub *versus* counter-shaft gears. One point which most of your correspondents ignore is the great simplicity of counter-shaft gears as compared with hub gears. Practically all counter-shaft gears are so simple, and the parts are so large and strong, that even a novice can venture to dismantle them if trouble is experienced on the road. This is very far from being the case with three-speed hub gears, which are extremely complicated in their internal parts.

That the makers take the same view is evident, since I recently wrote the makers of what is perhaps the best known three-speed gear on the market, asking if they could let me have any literature explaining the internal construction. The reply was that if I thought there was anything wrong I had better send the gear up to the factory. I wrote again, stating that I did not propose to interfere with the gear unless in the case of absolute necessity, but wished to understand it in case of trouble on the road. This second letter was entirely ignored, so I suppose the inference is that the gears are so complicated that even the makers cannot explain them verbally! Also I suppose it is hopeless to attempt any adjustment outside the factory.

I certainly think the counter-shaft gear scores heavily in respect of simplicity, and shall, I think, try one on my next machine.

I have, fortunately, not experienced any trouble with my three-speed hub up to the present except an occasional failure to change down on hills, but I certainly look forward with considerable uneasiness to the possibility of gear trouble on the road, although I can sign myself

ENGINEER.

Forced Feed or Splash Lubrication.

Sir,—The various makers of motor cycle engines do not seem to be in a hurry to give this matter their serious attention, and most of them apparently appear to be content to allow things to remain as they are, and are quite indifferent about the matter. It is quite certain that automatic lubrication of all types of engines must come about to ensure efficient and reliable working.

As regards the point raised in your issue of 11th September about the oil being supplied in proportion to the load on the engine, the problem is not one which offers any great difficulty. Surely, this is a simple matter, which the engine builders could most easily overcome. Take for instance the Bosch system. The lubricator is designed to be driven in the same manner as the magneto, but requiring much less power, and the oil which flows to the lubricator from the tank above is forced by the pumps through the small tubes or feeds, each in turn as the pump shaft revolves. These tubes are led direct to the cylinders and other parts of the engine, and the supply of oil to each can be adjusted independently by simply turning the screw either one way or the other, as a smaller or larger quantity is required. It would be quite easy to arrange a bypass connecting two of these tubes, thus obtaining at any moment a double supply of oil, if necesary, when wanted, or *vice versa*. The great point of the Bosch system is that the oil is being forced under great pressure, and the action is absolutely positive, which is of vital importance.

Recent correspondence proves that many riders are obtaining everything but satisfaction from their existing arrangements, and anxiously await the application of more up-to-date mechanical methods, as are applied in practice where larger engines are dealt with.

CHAS. GORICK.

(1) A view on the Col de Fray Miquel, showing the Roc motor cycle ridden by C. E. Squire through the Pyrenees.

(2) The summit of the Col de Puymorens obscured in clouds. The notice board on the left gives the altitude and warns motorists to slow down as a dangerous turn is close at hand.

Sir,—*The Motor Cycle* of September 11th contained three independent references to the subject of lubrication. Some people would have us believe that the ordinary systems of lubrication employed in motor cycle engines are satisfactory, and that "improvements" bring disadvantages and add complications.

No doubt this opinion is largely justified, firstly because it is a truism that very few improvements can be effected without involving complication, and secondly, because many automatic lubrication systems are actually more unreliable and unsatisfactory than the ordinary hand pump.

Whether ordinary "splash" lubrication can be said to be satisfactory is primarily a matter of opinion depending upon the ideals of the rider. If he is satisfied with between five and ten thousand miles service, and is not particular as to *how* his engine runs provided it takes him along at the pace he wants, then splash lubrication will satisfy him. That a very large number of riders look for something better than this is shown by the continual reference to the subject of lubrication and the interest which it excites. Thus, in *The Motor Cycle* of September 11th, there is a leaderette dealing with the subject, an article by "Red Wheels," and a reference by "Ixion" to "Acute recurrent bigenditis."

I should like to endorse the opinions expressed by "Ixion." I think that the other two writers miss a few rather important points. They appear to take it for granted that mechanical lubrication must possess the fault either of varying the feed in proportion to the engine speed or of maintaining a constant feed to the crank case. Under these conditions the engine is over-lubricated when running fast on a light load, or when running slowly or after descending hills.

Now a system of true forced lubrication, in which oil is fed direct to the bearings whilst the flywheels and big end are clear of the oil in the sump, does not possess these faults. If, as is usual, the pump is arranged to deliver more oil than the bearings are able to pass, the surplus going through a spring-loaded relief valve, it is a very easy matter to regulate the supply of oil by varying the pressure on the relief valve spring. If this spring and valve are arranged in an accessible position there is no difficulty whatever in connecting the control gear to the throttle lever and so making the oil feed strictly proportional to the work done. This arrangement has been employed in Delaunay-Belleville cars, among others. It has been proved beyond doubt that for maximum efficiency it is necessary that clean oil be forced between all rubbing surfaces, and that a plain bearing under these conditions is the sweetest running and longest wearing bearing it is possible to obtain.

For the requirements of the high speed petrol engine may be added the following:

1. The oil filter should be easily accessible, and its cleaning should involve no loss of oil.

2. The oil pressure should be able to be regulated without the aid of tools.

3. The maximum quantity of oil should be fed to the bearings consistent with getting correct cylinder lubrication.

It is on these principles, among others, that the modern ultra-efficient motor car engine design has been built up. How would Sunbeams, Vauxhalls, *et hoc genus omne*, fare with splash lubrication and crank chambers containing only an "oil fog"? The slight extra expense due to forced feed lubrication is amply repaid in increased service.

If the above points were thoroughly grasped we should hear very much less discussion on the question of bearings and their lubrication. A.M.I.C.E.

A Motor Cycle Tour in the Pyrenees.

Sir,—I noticed a paragraph on page 1202 in your "Sparklets" columns of *The Motor Cycle* that I think refers to myself. The highest pass I went over was the Col de Fray-Miquel, 8,022 feet. This road leads across the frontier into Andorra as far as Soldeu. It has not been opened long, and, judging by the appearance, cannot have been traversed by anything on wheels more than a few times, and I think never before by a motor cycle. I had a fine trip, and do not think anyone could do more in the time. I went over most of the passes between the Mediterranean and Lourdes, and would be happy at any time to give any of your readers any information I can. I took many photographs, but only have the enclosed prints by me at the moment. C. E. SQUIRE.

Determining Top Gear Ratios for Cycle Cars.

Sir,—The article by "Engineer" in *The Motor Cycle* of 18th September, on "The Influence of Correctly Proportioned Gear Ratios for Cycle Cars," comes opportunely, and should do much to silence the originators of the "freak" gear movement. This article, written by a technical man, is to be commended to makers of sidecar motor cycles for careful attention.

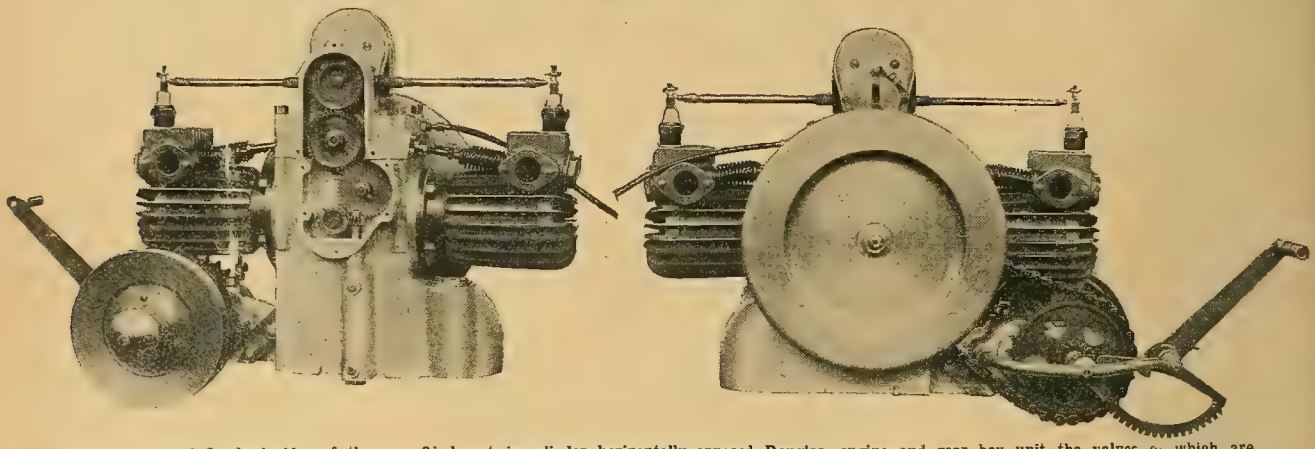
One point, in my opinion, is incorrectly treated, namely, the selection of the top gear ratio. I maintain that the correct gear is not a matter of compromise or choice, but a fixed quantity, depending on the maximum output and the corresponding speed of the engine which is destined to propel the machine.

The correct top gear is arrived at as follows: Calculate the speed at which the engine, when developing its maximum power, can drive the car on the level. The r.p.m. of the driving wheels divided by the engine speed at which maximum output is developed (figures obtained from bench tests of the engine) gives the reciprocal of the top gear ratio to be used.

In regard to the climbing qualities of a machine on top gear, this, as "Engineer" points out, is entirely dependent on the ratio of engine power to total weight of the vehicle, but hill-climbing should not influence the designer in selecting the top gear ratio. H. M. STICH.

A 3½ h.p. 494 c.c. DOUGLAS.

Equal Bore-Stroke Ratio. Pump Lubrication. Engine and Gear Box Unit.

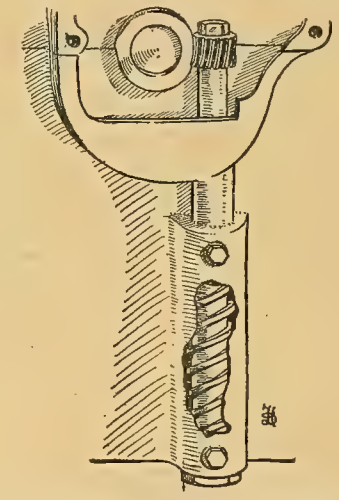


Timing gear and flywheel sides of the new 3½ h.p. twin-cylinder horizontally opposed Douglas, engine and gear box unit, the valves of which are placed over the top of the cylinders.
(1) Showing the oil pump driving mechanism from main-shaft and large driving pulley. (2) The kick-starter mechanism and chain drive from engine to gear box.

IT is always a pleasure to examine a new type of machine, and when the machine is the product of so well-known a firm as Douglas Bros. interest is greatly increased; consequently we were glad when it fell to our lot to inspect the new 500 c.c. machine which this firm will place on the market for the 1914 season. As might be expected, the salient features of Douglas design are retained, though many modifications and improvements have been incorporated. When Mr. Douglas explained to us that he was very proud of the new design we were prepared to see something good, and from a subsequent inspection we consider that his pride is likely to be justified by future sales and performances.

Some Striking Features.

The first point to strike us was the large oil sump below the crank case, which holds approximately seven pints, or enough to free the rider from any lubrication worries for about 1,000 miles, and forms a platform on which the engine unit rests, and is held in the frame by two long bolts, which, through the medium of neat clamps, exert a wedging action on special cast lugs (see sketch). It is only necessary to slack the two nuts and to remove the petrol union and belt to take the whole engine, gear box, kick starter, exhaust box, etc., from the frame; in fact, we saw the feat performed in about two minutes. At the back of the sump is a sloping platform, to which the



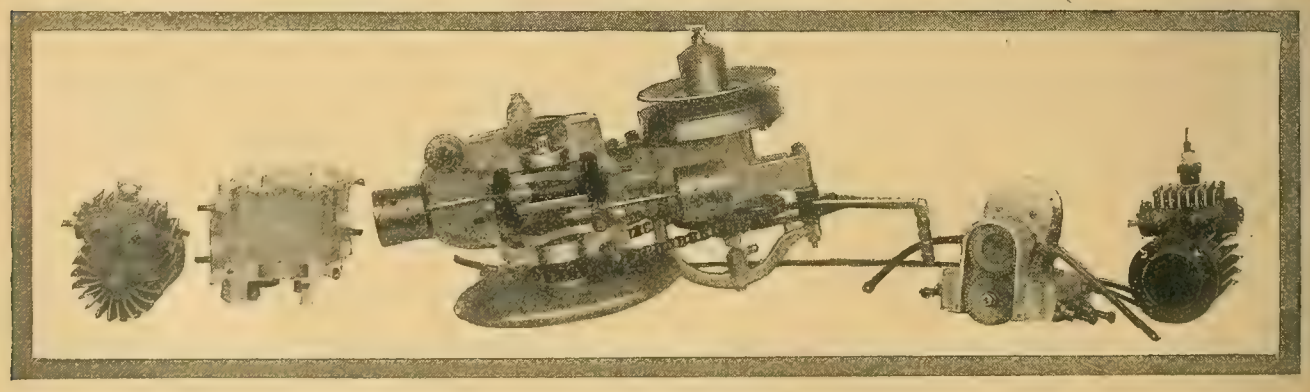
Worm driven Douglas oil pump showing the screw type lifter fitted.

gear box is attached in a somewhat similar manner to the engine fixing. This forms a very simple chain adjustment, for, by slacking the holding bolts, the gear box can be slid up or down the platform without any possibility of deranging the sprocket alignment.

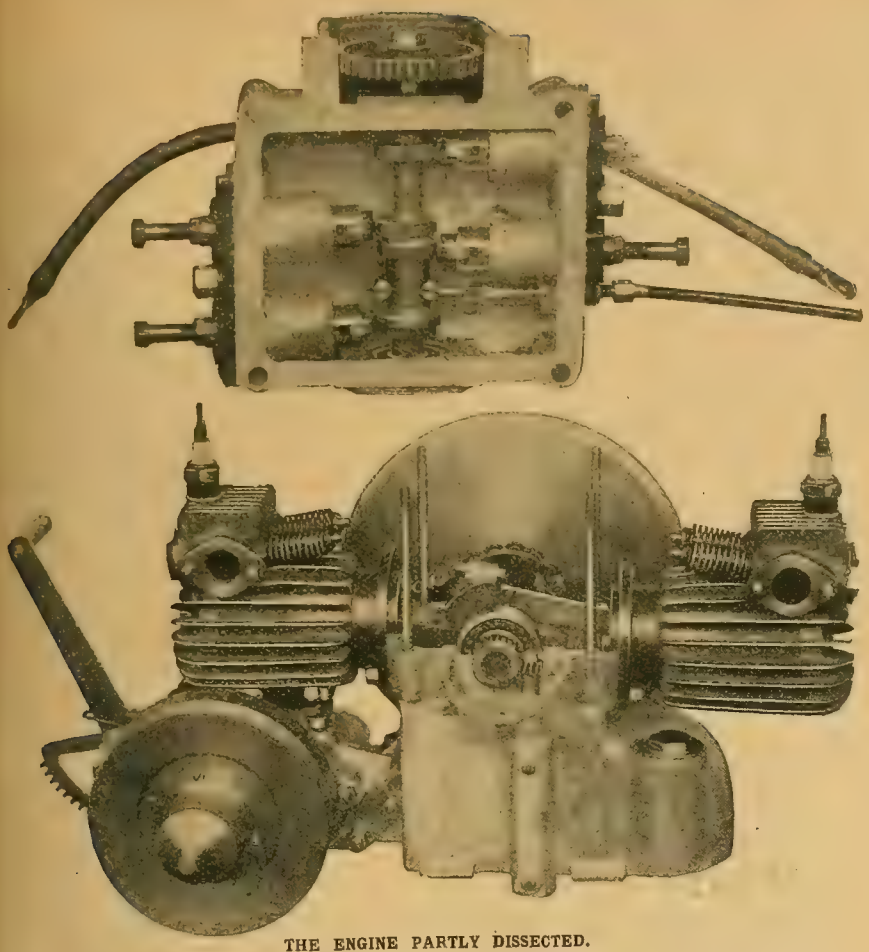
The Lubrication System.

From the sump before mentioned oil is raised by means of a screw pump driven at one-third engine speed by a worm gear on the end of the crankshaft. On reaching the crank chamber the oil is led into troughs below the cranks, the surplus oil returning to the sump through two large filters placed one at each end of the crank chamber. The crank chamber proper is split horizontally, and contains the usual Douglas type balanced crankshaft, to which are attached connecting rods with split big end bearings. On top of this chamber is mounted a third casting, which contains the solid camshaft and carries the magneto. The camshaft and four cams are machined from one piece and mounted on ball bearings, the cams operating the valves through large rollers and adjustable tappets, the design reminding one of modern car practice rather than the usual motor cycle rocker gear. On the camshaft, and capable of being rotated round it is an arrangement of double cams, which form the exhaust lifter.

The cylinders have a bore and stroke of 68 mm., and are, of course, hori-



The new 494 c.c. twin Douglas engine in parts.

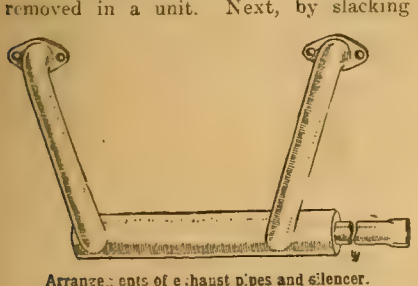


THE ENGINE PARTLY DISSECTED.
The enlarged view at the top is of the underside of the camshaft case and illustrates the design of the tappets and exhaust lifter.

zontally opposed, but in this new model the valve pockets are placed on the top of the cylinders instead of at the sides, the ports being so constructed as to prevent a broken valve head from falling into the cylinder head. The valves are slightly inclined downwards to the head, and the ports are cast with longitudinal ribs. An 11in. diameter outside flywheel is fitted to the one-piece crankshaft.

The engine is a masterpiece of accessibility, for, besides the fact that the unit may be withdrawn so easily, the following points are worth notice. All four valves can be easily removed while the engine is in position, so also may both cylinders. The magneto is held by two nuts and its gear wheel.

By removing four nuts the whole of the cam gear and magneto may be removed in a unit. Next, by slacking two nuts on each cylinder, the top half of the crankshaft chamber can be removed, leaving the cylinders still in position. The oil level may be inspected by removing the filler cap, which is so placed that it is impossible to fill the sump too full.



Arrangements of exhaust pipes and silencer.

The Driving System.

A ¼ inch × ⅝ inch Hans Renold chain connects the engine and gear box, the latter being similar to the well-known 2¾ h.p. type, though strengthened up somewhat and fixed in the manner already described. The clutch is faced with Ferodo, and the diameter has been increased to seven inches, the same size as the belt pulley. The kick starter is as usual.

Both inlet and exhaust pipes are neatly carried out, the carburetter lying just behind the magneto, and the two exhaust pipes lead tangentially into a larger pipe set longitudinally, the exit being by a tail pipe. It is well to mention that the new features are all patented. The frame, which carries the power unit, though of pleasing appearance, has no very unusual features, except for the forked down tube, which enables the valves to be easily removed, and the special sidecar lugs, one of which is fitted below the bottom bracket. Neat footboards are fitted to the touring model, which, with the wide smooth mudguards, should prove effective protection from muddy roads. The spring forks are of the usual Douglas pattern, though, of course, considerably strengthened. Carrier, stands, and tool bags are on well tried lines.

The tank, which contains petrol only, is on the lines of those fitted to the T.T. 2¾ models. A T.T. model will be sold which will be without clutch and footboards. Although the price is not definitely settled, it will be approximately the same as other well-known 3½ machines. 26in. × 2⅜in. tyres are standardised. We particularly wish to impress on our readers that the machine has undergone many many miles of strenuous road

Neat high tension wire on 3½ h.p. Douglas. The tubular casing is kept in tension by an internal spring.

tests and has proved perfectly satisfactory, and we hear that it is even more efficient for its size than the popular 2¾ h.p. model.

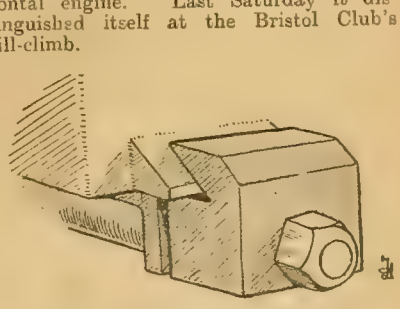
A Douglas Sidecar.

Messrs. Douglas Bros. have evidently recognised that this new production will be largely used for sidecar purposes, for they have designed a special sidecar to suit the machine, which has several interesting features. The side members are constructed in the shape of a bow and string, and the body is attached by three full elliptical springs, one at the front and one at each side; these should render riding particularly easy. The chassis is attached to the frame at four points to ensure rigidity. The usual stay from the saddle pillar to the rear of the chassis is augmented by a similar stay from the head to the front, and, in addition, a cross tube is fixed to the footboard support and another to a point below the bottom bracket. The coachbuilt body has a comfortable riding position and a smart appearance.

Douglas Machines for the Colonies.

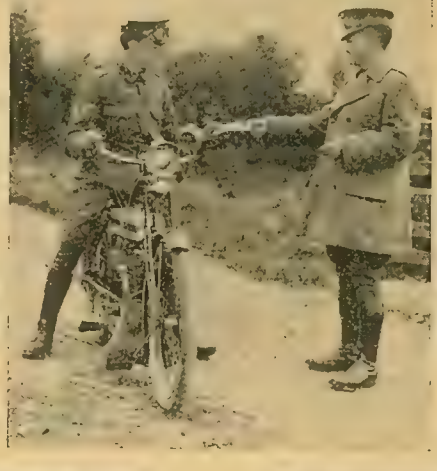
Before we left the works Mr. Douglas pointed out a large consignment of machines for the Colonies and the Continent, and informed us that he has already entered into contracts for 6,000 machines for next year.

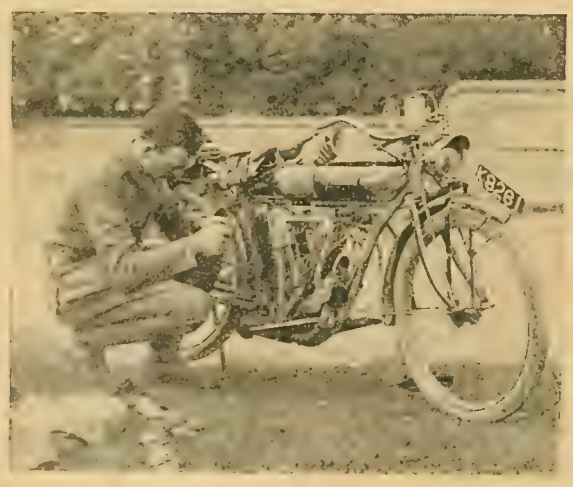
Of course, the well-known 2¾ h.p. model will be retained, but the alterations for 1914 will not be on a large scale. Whilst at the works we also saw a very smart cycle car fitted with a taking streamline body and the 8 h.p. water-cooled horizontal engine. Last Saturday it distinguished itself at the Bristol Club's hill-climb.



Method employed for fixing engine in frame. Two of these fixings are used.

The MOTOR CYCLE IN THE MILITARY MANOEUVRES





(1) Headquarters at the King's Arms, Stokenchurch. A Rudge rider in the foreground. (2) The old and the new method of despatch carrying. (3) A Royal Engineer delivering a message. His machine is a 3½ h.p. Triumph. (4) A Lancashire Royal Engineer stops to change a plug. (5) A Bradbury rider arriving at headquarters, Stokenchurch, with a despatch.

The Motor Cycle in the Army Manoeuvres.

MIDLAND motor cyclists turned out in hundreds at the week-end to inspect the different camps in connection with the army manœuvres. This is only natural, seeing the important part motor cyclist scouts and despatch riders are playing in the manœuvres. The Delta airship, which is quartered near Dunchurch, drew large crowds, and the score or so of aeroplanes ranged up in orderly fashion in a field near Crick, commanded much attention.

Motor cycles of every make, and some of doubtful age, are participating in the manœuvres. At one time any old accumulator ignited crock was permissible so long as it came under the appellation "motor cycle," but the authorities are a little more strict this year, and magneto ignition is essential.

We believe that more motor cyclists would have been pressed into service if offers had been received. There are plenty who would have volunteered their services, if information on the question of enrolment had been easier to obtain. Occasonally the notice given of vacancies occurring in the ranks was rather short.

Several smart P. and M.'s are permanently attached to the Royal Flying Corps. The motor cyclists seemed to be thoroughly enjoying their work, conveying despatches with all speed as enthusiastically as if their lives depended upon it.

A well-known motor cyclist, who is connected with the Special Reserve of Motor Cyclists, writes us that he considers that a number of riders seem to have some difficulty in deciding whether they should join the Special Reserve or the Territorial Force of Motor Cyclists, so some particulars of the chief differences may be of service :

Royal Engineers : Special Reserve. Rank : Corporal or sergeant. Location of unit to which attached : All in South of England or Ireland. Age of enlistment : Eighteen to thirty. Term : Four years. Pay when on duty, including motor cycle allowance : Sergeant 11s. 6d. per day, corporal 10s. 9d. per day, with separation allowance for married men. Free rations and uniform. Bounty : £1 annually on completion of training after first year, and £3 per year, provided motor cycle is kept in serviceable condition. Travelling allowance : 1½d. per mile between home and destination by shortest route, not to exceed third-class rail for self and motor.

Motor cyclists—Territorial Force. Rank : Corporal or lance-corporal. Location of unit to which attached : In nearly every town of any size. Age of enlistment : Seventeen to thirty-five. Term : Four years. Pay when on duty, including motor cycle allowance : Corporals 10s. to 10s. 6d. per day, lance-corporal 9s. to 9s. 2d. per day, with separation allowance for married men. Free rations and uniform. Travelling allowance to camp : Amount of railway fare for self and cycle by shortest route.

Thus a Special Reservist corporal spending fifteen days in camp fifty miles from his home will draw, roughly, £12 12s. 9d. for his year's service, while a Territorial lance-corporal will draw a minimum of £7 7s. 4d., and be kept free in both cases. Those enlisting now can get their recruit drills worked off during the winter and be qualified to take their place in the field when the manœuvres start next year.

(1) Taking a well earned rest by the roadside. (2) Douglas and Bradbury riders taking cover in the bracken. (3) A mechanical travelling workshop in connection with the Royal Flying 3rd Squadron in a field at Wolvercote near Oxford. The machines are P. and M.'s. (4) A Scotch officer attached to the Brown Army leaving Stokenchurch. (5) Two of the Cambridge U.O.T.C. awaiting orders at Boulters End.

October	1	...	6.38

Olympia Motor Cycle Show Exhibits.

At the Olympia Show, from November 24th to 29th, seventy-three firms will exhibit motor cycles and sidecars and twenty-four cycle cars. In addition ninety-five firms dealing in motor cycle accessories have booked space.

The Team Race at Brooklands.

It appears that in the One Hour Senior Team Race at Brooklands, on the 13th September, in which the Enfield team scored such a fine win, H. V. Colver was second with 54 miles 590 yards to his credit, and D. Iron third with 45 miles 275 yards.

The Cremona Circuit Record.

S. A. Rowlandson protests to us that our Italian correspondent is in error in stating that Carlo Maffeis broke the record for the Cremona circuit as reported in our issue of 18th September in the recent Italian Championship Meeting, and in support of his claim to still holding the record points out that he averaged 55¼ m.p.h. over this circuit against Maffeis's average of 53 m.p.h.

Cheap Tyres, Dear Petrol.

On September 18th the price of rubber in Mincing Lane fell to the low level record of 2s. per pound. While doubtless the shareholders in the rubber companies will not rejoice thereat, motor cyclists will welcome the news, for a continuance of these low prices for the raw material is bound eventually to reduce the price of tyres. But petrol is still a fly in the ointment, and there appears little prospect of that useful but not absolutely necessary commodity "slumping" at all in price just yet.

The Upside-down Airman at Brooklands.

We are informed by Major Lindsay Lloyd that arrangements have been made between the B.A.R.C. and M. Pegond for him to give demonstrations at Brooklands on the 25th, 26th, and 27th September between 3.30 p.m. and 6 o'clock, weather permitting. This demonstration will include flying in an inverted position. This feat is the deliberate carrying out of an idea of M. Blériot's in which he wished to demonstrate the stability and control of his machine in practically any position into which it may be forced.

A.A. and M.U. Notes.

Motor Cyclists and Level Crossings.—A number of complaints have been received of late of the difficulty experienced at level crossings, the gatekeepers contending that the small swing gates at the side should be used in preference to the carriage gates. The Association have taken up the matter with the various railway companies concerned, and already the General Manager of the G.W.R. has given instructions for the gates at all level crossings on the line to be opened for motor cyclists whenever occasion arises.

The Danger of no Reflex Light.

Once more, as the evenings draw in, the necessity of not only proper lighting for motor cycles, but also for other users of the road, is borne upon riders. The necessity of carrying reflex rear lights by cyclists is also a pressing question, and if they but realised the danger they are in on a dark night without such warning device, we think every cyclist would have his machine equipped with these cheap and useful fitments. Quite recently the opening run of the Camberley M.C.C. was postponed by the sad death of one of the members. He was riding the evening before when he suddenly had to swerve to avoid a cyclist without a reflex light—and he was thrown heavily with fatal results.

SPECIAL FEATURES:

FOUR 1914 MODELS.
HELVELLYN CLIMBED.
MOTOR CYCLISTS IN THE MANŒUVRES.

Trade Announcement.

Mr. W. J. Green, who has been associated with the Premier Cycle Co., Ltd., Coventry, for the past ten years as secretary, advises us that he has resigned his position with the company, and desires all personal communications to be addressed to 75, Coventry Street, Coventry.

Novelty in a Midland Trial.

To render the open reliability trial of the Sutton Coldfield Club, fixed for October 4th, more interesting, novel schemes are in hand. The committee are endeavouring to get all the winners of the past T.T. races to compete, the idea being to show that the speedman can also keep his mount down to a 20 m.p.h. schedule when desired. After the trial it is intended to invite all the winners to a dinner, also influential men and the press. An endeavour is being made to arrange the start and finish of the trial from the middle of Birmingham. The club officials have got a highly suitable spot, where all sorts of refreshments can be obtained, and it is within fifty yards of New Street.

Group of competitors at the finish of the Birmingham M.C.C. Trial to Carlisle and back. Left to right—H. Berwick (3½ h.p. Hampton), A. Milner (2¾ h.p. Levis), S. Tharp (3½ h.p. Triumph), D. M. Brown (3½ h.p. Rover), and G. Nott (5-6 h.p. Clyno sidecar).

1914 Models.

This week we describe and illustrate four 1914 pattern motor cycles, viz., the new 3½ h.p. horizontal Douglas, the 2½ h.p. F.N., 3½ h.p. Sunbeam, and the new Comet-Green.

Helvellyn Climbed by Motor Cycle.

Two of the Six Days Trials riders evidently enjoy mountain climbing on motor cycles. Following upon Skiddaw, their latest achievement is the ascent of Helvellyn last week-end. An exclusive description of the feat appears in this issue.

A Singer Experiment.

A Singer motor bicycle with horizontal engine has been seen on Midland roads undergoing tests for some weeks past, but, on enquiry, the company inform us that it will not be marketed this year at any rate. We are assured that the machine has proved very speedy.

Up Six Days Trials Test Hills.

A reliability run was held at the week-end, open to those members of the Westmorland M.C.C. who had not won a first, second, or special prize during the year. The run was a non-stop between-checks, a secret check being arranged in the event of a tie. Results: 1, E. Milton (8 Zenith); 2, H. Cleary (3½ Zenith); 3, J. Clement (3½ New Hudson). The run for the Triumph Challenge Cup, held on the 31st of August, and which ended in five competitors tying for first place, was also run at the beginning of the week. A very stiff course was chosen for the purpose, and included about six of the hills which were used in the A.C.U. Trials. Results: 1, G. A. Gregson (6 Bat), 10s. error; 2, P. L. Bryant (3½ Triumph), 2m. error; 3, W. Hutchinson (6 Zenith), 3m. error.

FUTURE EVENTS.

Sept.	27.—	Liverpool A.C.C. Open Reliability Trial.
Oct.	4.—	Sutton Coldfield & Mid-Warwickshire A.C. Open Trial.
,,	4.—	B.A.R.C. Brooklands Meeting.
,,	4.—	Bristol M.C.C. Open Speed Trials.
,,	11.—	Coventry & Warwickshire M.C. Annual Open Hill-climb.
,,	11.—	B.M.C.R.C. Meeting and A.C.U. Championships.
,,	29.—	A.C.U. Open One Day Trial for Cycle Cars.
Nov.	24 to 29.—	Motor Cycle & Cycle Car Show at Olympia.

Stoupe Brow Climbed.

A telegram received on Monday from Dan Bradbury, of Sheffield, states: "Yesterday I made first unassisted climb by motor cycle of Stoupe Brow, Robin Hood's Bay, on big 4 Norton."

An Officially Observed Test.

Last evening, at 9 p.m., Rex Mundy was due to start from the R.A.C. garage on an 8 h.p. water-cooled Williamson sidecar in an attempt to drive to Edinburgh without stopping the engine. He is being observed by an A.C.U. official.

Pilot Jet Carburetters.

Next week we shall describe and illustrate a new design pilot jet carburetter which we have tested on the road to give a consumption of 157.4 m.p.g. on a 3½ h.p. machine. Incidentally, it is interesting to observe the growing popularity of the pilot jet device, especially in view of our recent articles in favour of such fittings.

A typical view on the way up Helveilyn showing the rough path strewn with boulders. Thirlmere is seen winding northwards far below. (See next page).

Ben Nevis Climbed on a Sidecar.

During last week-end D. B. H. of Glasgow, climbed Ben Nevis, Britain's highest mountain, with his 6 h.p. A.J.S. and sidecar.

A Two-stroke Clyno.

The Clyno Co. have a two-stroke single-cylinder lightweight undergoing test, and it is now quite a common sight to see it hauling a sidecar in the Wolverhampton district. We hear from the trials secretary of the Oxford Club that it may make its first appearance at Alms Hill, Henley, next Saturday at the inter-club hill-climb of the Middlesex M.C.C., the North-West London M.C.C., and the Oxford M.C.C.

Motor Cyclists in the Manœuvres.

Our contributor "Mercury," who is attached as a motor cyclist to the Chief Umpire's staff during the manœuvres, tells us that he has had varied experiences in camp. One night men and machines were drenched with rain, but on a fine day it was delightful work. The services of quite a number of well-known motor cyclists have been utilised by the War Office, and among them, it is interesting to note, is F. W. Applebee, senr., who although too old to join the regular service, evidently feels his services appreciated by the authorities, for this is the fifth successive year he has been attached.

In Birmingham.

At the start of the Birmingham Club's open twenty-four hours' reliability trial on Friday we noticed George Brough, who had ridden over from Nottingham on his new horizontal-engined Brough. He readily demonstrated to us the ease with which it started by sitting in the saddle and hobbying it along with the feet. It will accelerate in wonderful fashion.

We also encountered P. J. Evans, who is running one of the prettiest little cycle cars one could set eyes on, viz., the four-cylinder water-cooled Calthorpe. The lines of the bonnet tapering from the neat honeycomb radiator to the dashboard give it a very clean appearance. It runs as well as it looks, judging from a short trip we had in company with Mr. Evans.

The Gaillon Hill-climb. British Support.

As announced in our issue of the 18th inst., the classic Gaillon hill-climb will take place on October 5th. As several riders have expressed their desire to compete, *The Motor Cycle* is willing to organise a party to take part in or witness the event, leaving London on Friday evening, October 3rd, for Southampton, provided at least twenty riders send in their names. Those who intend joining the party should communicate at once with the Editor, who will immediately tell them the details of the programme. It is suggested that the party should cross by Southampton and Havre and cover the journey by road. If this idea is followed out the trip could be managed on the most economical lines and in the most comfortable manner. Up to the present Messrs. C. S. Burney, R. L. Keller, B. C. Barton, and W. H. Bashall have given in their names. Entries, which cost 10 fr. for motor bicycles, sidecar combinations, and cycle cars, should be addressed direct to *L'Auto*, 10, Rue du Faubourg, Montmartre, Paris.

UP HELVELLYN BY MOTOR CYCLE.

By GEORGE D. ABRAHAM.

Author of "Motor Ways in Lakeland," "The Complete Mountaineer," "Mountain Adventures at Home and Abroad," etc.

IN the North motor mountaineering has become a craze. Skiddaw, our third highest English mountain, was thought to be the culminating point of many minor climbs, but now Helvellyn has attracted attention. With its 3,118 feet of height it only comes second to Scawfell Pike in loftiness. Helvellyn may be considered the highest bit of England accessible to anything on wheels at present, for Scawfell Pike is altogether out of the running in this respect. Its topmost reaches, pathless and piled with rocks and boulders varying in size from a pea to an elephant, are not likely to have their echoes stirred by the "music of the motor." Helvellyn has more or less of a track all the way to the summit, and as the most central and most climbed mountain in Lakeland, its presence overlooking the main trunk road has seemed like a perpetual challenge to some of the motor mountaineers. Wythburn, with its famous little church, and still more famous hostelry, was the obvious starting place. The actual distance to the summit was only 2½ miles, but the question was, would the tyred wheels grip the steps of slippery grass and sliding stones?

A Perilous Stretch.

Such were one's thoughts as we sped onwards into the mountain gateway, with heathery heights aglow overhead, and under wheel the magnificent road which the Manchester folk have given us as ample recompense for any harm done to Thirlmere in the turning of it into a "drinking trough." As we drew nearer to Wythburn the steepness of the lower half of the climb was strikingly evident. A thin line trailed upwards through brackened steeps and zigzagged finally up the rocky front of the outlying buttress of Birkside. This latter would be the most perilous portion of the ascent, but on the tableland above the most troublesome route-finding problem would be encountered

All was peaceful at Wythburn when we arrived. The heroes of the occasion were late as usual, thus we

A HALT FOR REPAIRS. The 4½ h.p. Quadrant receives expert "medical" attention to the hole in the crank case.

wandered slowly up the slopes. The great clouds which hid the summit lifted gradually and our spirits rose with them, despite the fact that their recently deposited moisture had made the grassy track decidedly slippery.

Motors in the Mountains.

Nearly a thousand feet above the little white inn a splendid viewpoint was found, and soon the healthy bark of the mountaineering motors filled the narrow valley beneath. One by one cars and cycles came to a halt far below, and pedestrians spread themselves stragglingly up the lower slopes. A tiny dark speck crawled along the main road, and then turned up towards us into the region of grey rock and bracken. It seemed a strange invasion. How hardly could Scott have imagined the scene when long ago he wrote:

"I climbed the dark brow of the mighty Helvellyn,
Lakes and mountains beneath me gleamed misty and wide,
All was still, save by fits, when the eagle was yelling,
And starting around me the echoes replied."

Then ere long the well-known voice of an old friend was wafted up to us. Little, on his 3½ h.p. Premier, was agrip with the gradient. He threaded the lower rocks skilfully and came up splendidly, with Raymond Drinkall on his 4½ Quadrant close behind. But both were eventually in difficulties. Driving wheels spun helplessly on the slippery grass slope of 1 in 2¾. These were troublous times, and those of us who knew the terrors of Helvellyn's upper bulwarks thus early began to think of failure. However, the plan of tying ropes around the driving wheels was adopted. Thus aided, the first difficulty

A STRUGGLE UP THE GRASSY BULGE. W. B. Little on the 3½ h.p. Premier in a critical position. Thirlmere is seen in the valley 1,000 feet below.

R. Drinkall tackling a typical boulder-jumping section. It was a similar spot on which the crank case of his 4½ h.p. Quadrant was holed.

was overcome, and the two riders were struggling for balance on the rock-strewn incline in order to strike a fair way through the narrow gateway.

A steep bulge of slippery grass now caused some delay. All hope of a non-stop run was finally shattered. Friendly assistance was not refused, even by Little, who had parted company with his machine and rolled several yards down the mountain side into a mass of bracken, a softer welcome than that afforded by hard rocks close at hand. Drinkall was first away here, and now high overhead he threaded the lofty zigzags skilfully, an altogether thrilling and splendid sight to us below. His companion was soon also speeding out of the "Slough of Despond" up to the "Happy Heights of Hope." Those of us on foot raced upwards, cutting off the zigzags. Around a sudden corner a crowd was gathered. Every face wore an ominous look, and the Quadrant lay on its side amongst the boulders.

A Novel Repair.

Only Drinkall seemed able to smile, and this was remarkable, for his crank case was punctured and no repair outfit was available. It seemed that in leaping one of the turfy steps the crank case had most unluckily alighted on a solid bit of rock and come off second best. A hole as big as half-a-crown proved to be the result, and a temporary repair with sticking plaster and string was the outcome of much ingenuity. Then onwards and upwards the pair of enthusiasts struggled once more, far up the terrific zigzags to the crest of Birkside. Little's mount showed a dangerous tendency to tackle the almost vertical confronting bit of mountain at every sharp turn. At one point only the presence of the writer prevented machine and rider falling backwards, for the front wheel was pointing heavenwards and spinning merrily in mid-air. At last the narrow gully filled with loose stones was entered. Few footrests survived the passage through the rocky jaws. With a roar and a rush the Premier emerged from this dangerous spot, and Little soon disappeared out of sight summitwards. Next came the news that he was waiting higher up in a bog, and wondering who would volunteer the descent to Wythburn for a forgotten belt punch. The Dunlop belts had stood magnificently on both machines, but here a shortening became advisable. A twenty minutes halt was necessary whilst, with hairpins, files, and penknives, a hole was made in the tough belting.

Helvellyn Conquered.

Little seemed surprised at the success of our efforts, and showed his gratitude by mounting the machine and riding away direct to the summit, almost a mile away. We followed leisurely, and finally arrived with cameras and congratulations to enliven the wait of the first motor cyclist to reach Helvellyn's crest. Drinkall was half an hour behind, but even this was an altogether unique performance, for the temporary repair of the crank case had broken away, and each charge of oil simply lubricated Helvellyn instead of the engine. Yet machine and man had come through scathless. Why that engine refused to seize must remain a mystery. There was much enthusiasm amongst the spectators on the summit.

The view from this height of 3,000 feet was magnificent, but one is afraid it received scant appreciation. A thin air seemed to blow unretarded through many a hungry mortal, for everybody's lunch had been left at Wythburn. The climb had taken two and a half hours, as prophesied by Moffet. This keen sportsman, who rendered such yeoman service during the Six Days Trials, was always the optimist of the party.

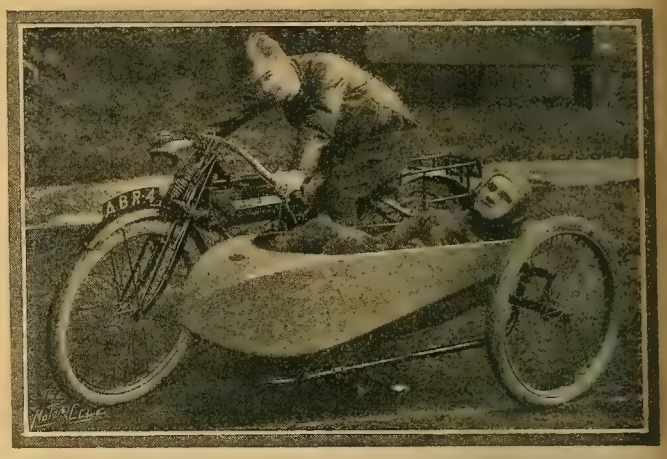
On the highest actual point of Helvellyn, 3,118 feet high. Messrs. W. B. Little (3½ h.p. Premier) and Raymond Drinkall (4½ h.p. Quadrant) the first motor cyclists to scale the peak.

Up Helvellyn by Motor Cycle.—

However, we were glad to turn valleywards. There was just time to notice purple mountains of a thousand forms crouching all round, and silver lakes gleaming in their sun-bathed hollows, ere the huge bulk of Striding Edge cut off the easterly prospect. That glimpse of the blue waters of Red Tarn, a thousand feet below, was a pleasant memory as we raced down the heathy uplands, seldom far away from the brake-weary motor mountaineers. The descent was achieved without mishap.

A considerable crowd awaited the arrival of the cavalcade, and one outspoken daleswoman caused some amusement. She said to Little, in his own Cumbrian dialect, "Ay! man, thou desarves summat for gaan oop theer!" "Well, mother, what's the prize?" up spoke the elated climber. "Ah'll give thee six months in a mad-house!" came the curt reply, and everybody laughed boisterously. Mad though it seemed to some, the new sport of motor mountaineering has tremendous fascinations, and, though grim old Helvellyn will seldom be overcome, some of the lesser heights will doubtless receive organised attention. Club meets amongst the mountains will most probably be the outcome.

Finally, a word of praise must be given to the machines. Some of us thought that none but a 3½ Premier could tackle such rough-and-tumble work successfully, but the performance of the Quadrant was wonderful. Like the Premier, the gears were standard; in each case 12 to 1 was the lowest ratio. The Stelastic tyres behaved faultlessly, and the same may be said of the Armstrong gear. Altogether it was a remarkable day, and an experience that neither spectators nor motor mountaineers are likely to forget.



The 3½ h.p. B.S.A. sidecar on which Kenneth Holden captured the five miles record at Brooklands last week. His time was 5 min. 58 secs. (see page 1237).

SATURDAY'S TRIAL IN NORTH WALES.

Official Numbers and Order of Starting.

ON Saturday next the Liverpool Auto Cycle Club will hold its open one day trial, which is under Manufacturers' Union support. The start is from Queen's Ferry Bridge, at 8.0 a.m., and the course is in North Wales, including Bwlch-y-Groes.

Some extra special awards are announced, including Stelastic tyre and tubes and a Lyso belt.

More helpers are wanted to check the riders. Readers should write Mr. Philpott at once, stating what time they can be at any part of the course.

The following is the order of starting:

1. E. F. Baxter (6 Rex)
2. W. Heaton (2¾ A.J.S.)
3. M. Ode (3½ Rover single gear)
4. C. Wilson (3½ Quadrant)
5. Quentin Smith (3½ Triumph)
6. G. Wray (5-6 Clyno sc.)
7. F. G. Edmund (3½ Humber)
8. J. Browne (2¾ Douglas)
9. E. W. Cheshire (3½ Triumph)
10. C. T. Newsome (3½ Rover single gear)
11. W. H. Carson (Excelsior sc.)
12. S. Tharp (3½ Triumph)
13. A. J. Dixon (3½ Singer)
14. W. J. Henderson (Rudge)
15. O. Wade (6 A.J.S. sc.)
16. L. V. Barton (6 Rex)
17. J. H. Sedgewick (5 Rudge)
18. L. Guy (Scott)
19. R. W. S. Court (6 A.J.S. sc.)
20. F. Dover (3½ Premier)
21. R. F. James (6 Rex)
22. S. C. Perryman (3½ Quadrant)
23. J. Baker (5¾ Scott)
24. D. Bradbury (4 Norton sc.)
25. J. B. Spreston (2¾ Sunbeam)
26. H. G. Bell (5 F.N.)
27. J. Cocker (3½ Singer)
28. T. C. de la Hay (6 Sunbeam sc.)
29. A. C. Fenn (3½ B.S.A.)
30. N. A. Ayres (2¾ Sun-Villiers)
31. J. A. Dudley (2½ Hobart
32. Hugh Gibson (6 Bradbury sc.)
33. H. Marston (Rudge)
34. V. E. Horsman (3½ Singer)
35. A. J. Jenkins (3½ New Hudson)
36. F. Smith (Clyno sc.)
37. L. Pack (2¾ Douglas)
38. R. G. Mundy (3½ Triumph)
39. S. Sawer (3½ Premier)
40. D. H. Noble (3½ Rover)
41. A. C. Scott (7 Premier sc.)
42. C. E. Nokes (3½ Sunbeam)
43. S. Doward (3½ Bradbury)
44. T. E. Greene (Rudge single gear)
45. G. Featherstonehaugh (3½ Rover)
46. C. S. Burney (3½ Blackburn)
47. R. Pearson (Clyno sc.)
48. J. Haslam (3½ Rover sc.)
49. Mrs. Baxter (6 Rex)
50. S. T. Tessier (6 Bat)
51. J. H. Greene, jun. (3½ New Hudson)
52. L. F. Harvey (Clyno sc.)
53. N. H. Brown (7 Indian)
54. S. Tubb (3½ Humber)
55. H. Silver (4½ Quadrant)
56. P. Proud (3½ New Hudson)
57. W. Croes (6 A.J.S. sc.)
58. H. Newey (2½ Levis)
59. J. H. Fox (3½ Edmund)
60. A. G. Cocks (2½ Connaught)
61. C. B. Wilson (6 Bat)
62. W. H. Kelly (8 Rex-Jap sc.)
63. H. R. Davies (2¾ Diamond)
64. R. Catey (3½ B.S.A.)
65. J. J. Day (3½ Bradbury)
66. V. Busby (3½ Sunbeam)
67. T. Silver (7 Quadrant sc.)
68. A. Helber (2¾ Diamond)
69. A. W. Brittain (——)
70. W. V. Ford (2¾ Diamond)
71. H. W. Coopland (7 Indian sc.)
72. J. Dolman (2¾ Douglas)
73. W. Jones (2¾ A.J.S.)
74. J. S. Watson (2¾ Sunbeam)
75. G. A. Gregson (5-6 Bat)
76. H. C. Marston (3½ Triumph sc.)
77. F. W. Sixsmith (3¾ Scott)
78. R. P. Ravenhill (3½ Rover)
79. W. H. Longton (3½ Alldays)
80. L. A. Bees (4 L.M.C.)
81. M. C. Breese (3½ B.S.A.)
82. C. Freeman (Clyno sc.)
83. G. Hughes (2¾ Douglas)
84. L. Mogridge (2¾ Mead)
85. J. B. G. Vale (3½ Rover)
86. M. Glasgow (3½ Triumph single gear)
87. P. Fairhurst (5-6 A.J.S. sc.)
88. Miss Baxter (2½ Connaught)
89. S. Hughes (2½ Levis single gear)
90. W. F. Waddington (Campion)
91. S. Wright (Humberette)
92. H. F. S. Morgan (8 Morgan)
93. A. C. Whitney (Humberette)

V. Wilberforce (3½ h.p. Norton) leading T. G. Meeton (3½ h.p. Rudge) over the finishing line at Brighton last Saturday.

Birmingham-Carlisle-Birmingham.

Severe 400 Miles Twenty-four Hour Trial of the Birmingham M.C.C.

Flashlight scene in the Birchfield garage at the start of the Birmingham M.C.C. twenty-four hours' trial to Carlisle and back.

THERE were fifty-nine competitors in this trial, which started on Friday evening, at ten o'clock, from the garage of Messrs. Sarsons and Duke, Birchfield, and, as showing the severity of the test, only thirty-six completed the course by 10.30 o'clock on Saturday evening. The retirements were mostly due to the rain, which came down almost incessantly during the night journey northward. The competitors had gone to considerable trouble and expense in preparing their machines for the trip, chiefly in the matter of lamps. Practically all carried a pair of head lights; one or two of the sidecars had as many as four, and tiny electric lamps, controlled by switches, threw lights on the speedometer and route card. W. H Egginton's Enfield had an extra car head light on the sidecar and three generators. Cocks (Connaught and Duke (Rover), among others, used dissolved acetylene and seemed free from lamp worries as a consequence. There were only two cycle cars, S. Wright's Humberette and Armstrong's belt-driven four-wheeler, which latter was not seen after Carlisle. There was a considerable crowd at the start to wish the competitors good luck on their long ride, but no sooner had all been got under way than rain commenced, and fell continuously, sometimes slowly, sometimes in sheets, until Kendal.

Effects of the Rain.

Naturally, there was a good deal of incident under such severe conditions, punctures being frequent, whilst many complained of belt slip. The course was splendidly marked by strips of white paper laid by Mr. Oliver Lucas from his Daimler car. A.A. scouts, too, rendered excellent service in showing the way, one in particular—at Tarporley—drawing many expressions of praise. Longton, who was accompanied in his sidecar by "Corah" Clarke, broke the frame of his T.T. Alldays at Beeston Castle at 2.0 a.m., and it took some time to rouse the local hotel and get comfortably quartered. S. C. Perryman (Quadrant) caused much amusement by stopping under a railway bridge and removing his boot and sock to wring out the wet. It might here be remarked that there are oilskins and oilskins, as some of the competitors discovered. The driving rain went through some as if they were but mackintoshes. Breakfast was all ready waiting at Warrington, to which the rain-soaked riders did full justice, but a good many were late here, including Wright, who had to repair a puncture in his Humberette, and was then left with forty minutes to cover twenty miles, but still was only two minutes late.

The Lancashire cobble setts were not relished on such a night, and many solo riders had spills. Nott (Clyno) got his tyre into a tramline and skidded alarmingly, fortunately without doing any damage. Riley (Enfield sc.) broke the cable of his carburetter throttle, and tied his handkerchief in place; in this manner he completed 250 miles. Liefeldt (Rudge) was troubled with pre-ignition, and finally took his engine down at Preston to discover the reason. His companion, Bollack (Singer), who had sealed his tool bags before the start, struck a bad patch between 4 and 5 a.m., for he had to repair his back tyre on two occasions, though his machine never misfired throughout. Occasional banks of fog did not improve the conditions.

Single Gear and Low Power.

It is strange that among the few single-geared machines in the trial one of them should have the smallest engine. It was a two-stroke 2¾ h.p. Levis belonging to A. Milner, who rode most regularly throughout. He told us that his engine simply romped up Shap.

At Carlisle, where forty-eight arrived, the competitors had many experiences to relate. Mundy had to retire here, not due to any trouble with his Williamson, but to a painful arm (the result of an old fracture), which he had to carry in a sling.

The return journey was destined to prove really enjoyable, for the weather conditions greatly improved. We noticed

Another group of competitors. Owing to continuous rain the trial proved a very severe one.

that a number of riders were using the Badcock by-pass on a number of different makes of carburetters, and all spoke very highly of the device for traffic use. Bedford had one on his smart-looking Hazlewood, and Cocks one on his little Connaught, which now has many hundreds of miles of trials work to its credit. Great keenness was displayed in arriving at the time checks dead to the second—the competitors used their own sealed watches for this purpose—and the inclusion of a team prize added much interest to the trial. Near home Bollack had the misfortunte to break the engine chain of his twin James and damage the gear—a precisely similar trouble befell him in the Six Days Trials; Graham Dixon, on a similar mount, got through with only a puncture. Young (King Dick) charged a bank.

An Incident and its Lesson.

An incident which might have proved more serious occurred to H. Berwick, who was riding a Hampton. A mile or two from the finish his lamp went low, so he adopted the quite common expedient of blowing into the generator. Suddenly the whole thing burst and shot out flames, which badly scorched his eyebrows. He just got in to time by the aid of his spare generator. The tired riders checked in at Birchfield with wonderful precision considering the distance they had traversed. The mud-bespattered condition of their machines conveyed to the crowd some idea of what had been encountered

Among new machines which showed up well were two Diamonds, one ridden by H. R. Davies, the old Sunbeam exponent. A 4 h.p. twin Ivy-Precision, ridden by T. E. Farmer, should also come out well in the awards, for practically no trouble was experienced. Walker's Monarch, Stevens's James, and Johnson's Alldays were three single-cylinder sidecar outfits which completed the 407 miles run in good time. Two Ariels, ridden by Littledale and Newey, gave no trouble throughout, and it is a pity there was no third representative to make up a team, for Ariel teams have lately learned the winning way. So great was the casualty list that the Triumph and Rover teams appeared to be the only ones complete at 10.30 on Saturday evening. The complete results are not available for this issue, but we give below a list of survivors:

List of Survivors.

SIDECARS AND CYCLE CARS.

W. H. Egginton (6 Enfield sc.)
E. Walker (4¼ Monarch sc.)
T. Stevens (3½ James sc.)
G. Nott (5 5 Clyno sc.)
M. L. Riley (6 Enfield sc.)
A. H. Johnson (3½ Alldays sc.)
S. Wright (8 Humberette)

MOTOR BICYCLES.

H. Ball (Triumph)
F. J. Chidley (Triumph)
T. E. Farmer (4 Ivy-Precision)
A. G. Cocks (2½ Connaught)
S. A. Rowlandson (Rudge Multi)
R. W. Duke (Rover)
A. G. D. Clease (Rudge)
A. N. Barrett (5-6 Rudge)
E. H. Littledale (Ariel)
T. A. Biggs (Rudge Multi)
D. M. Brown (Rover)
H. Berwick (Hampton)
H. G. Dixon (3½ James)
S. C. Perryman (Quadrant)
L. L. Sealey (B.S.A.)
J. D. Drysdale (5-6 Hazlewood)
W. H. Bedford (5-6 Hazlewood)
J. Huntingdon (Triumph)
H. Hopkins (3½ King Dick)
S. Tharp (3½ Triumph)
L. B. Newey (Ariel)
L. A. Bollack (3½ Singer)
H. R. Davies (2¾ Diamond)
A. Holber (2¾ Diamond)
A. Milner (2¾ Levis)
E. Gutgemann (2½ Veloce)
G. H. Ratcliffe (3½ Rover)
A. W. Sarsons (Sun-Villiers)
S. G. Barnett (3½ Regina)

PERTH CLUB'S OPEN HILL-CLIMB.

An open hill-climb was held at Wicks o' Baigley, near Bridge of Earn, on Wednesday, last week. Several well-known Scottish riders took part. Results:

CLASS E.—Open, on time.

		Time.
1.	R. J. Braid (8 Martin-Jap)	37.2s.
2.	A. J. Carlow (6 Zenith)	40.0s.
3.	A. J. C. Lindsay (3½ Rover)	41.6s.

CLASS G.—Experts barred, on time.

1.	J. W. Adamson (3½ Triumph)	43.4s.
2.	J. G. Beveridge (3½ Rudge)	44.2s.
3.	J. Deas (3½ Rover)	46.0s.

CLASS B.—Open, on formula.

		Time.	Fig. of merit.
1.	A. J. C. Lindsay (3½ Rover) ...	41.6s.	280
2.	J. W. Adamson (3½ Triumph) ...	42.6s.	267
3.	J. Deas (3½ Rover)	44.6s.	257

CLASS F.—Experts barred, on formula.

		Time.	Fig. of merit.
1.	J. G. Beveridge (3½ Rudge) ...	44s.	257
2.	J. W. Adamson (3½ Triumph) ...	43.2s.	255
3.	J. Deas (3½ Rover)	46s.	246

SPEED TRIALS AT BRIGHTON.

Huge Crowds witness the Streatham M.C.C. Open Event.

SATURDAY morning broke in a most inauspicious manner in London It had rained all night and was still raining at 8 a.m. But later the weather showed signs of improving, though the sky was overcast, and the roads for some miles out of the metropolis were in a very treacherous condition. As we progressed further south things became a good deal better, and at Brighton itself the sun was shining and the sea shimmering brightly.

The entry for this event was a record, no fewer than 214 appearing in the programme. It was an ambitious undertaking, but the Streatham club is going ahead and wisely seeking to improve the lines on which it has been usual to run competitions in the past. These are the first speed trials run on the Madeira Drive, Brighton, since the R.A.C. racing week in 1905, when the late M. Cissac and Harry Rignold made world's records on their Peugeots. Mr. J. W. Orde, who is president of the Streatham M.C.C., was present and acted as one of the stewards.

In the morning the machines were examined by Messrs. Loughborough and Pratt, the judges, and one or two were disqualified for not complying with touring conditions. One of these was placed out of the competition for having a special type of exhaust valve, another for having rigid forks, and two cycle cars for not turning up at the examination. The course was about a kilometre long and in beautiful condition. The races were run from west to east, and a strong wind blew in favour of the competitors. Unfortunately, no times were taken, the men being given a flying start as they ran off in heats, keeping in line with Mr. Tessier's Rover, the official car, and starting when Mr. Ebblewhite dropped the flag. The competitors returned to the starting point after each heat by the Marine Parade.

Unfortunately, the organisation fell just short of being excellent. In the first place the classes should have been divided into heats in the programme. Proper metal number plates should have been used, and the men timed.

CLASS I. (for touring machines up to 350 c.c.) was the first item in the programme. There were only four experts, Aslen (Green-Precision), an Enfield, Cocker (Singer), and Busby (Sunbeam). Of these Busby (Sunbeam) won easily.

The general class was run off in two heats, and in the final Fordham (Douglas) easily beat Storace (N.S.U.).

START OF THE CYCLE CAR EVENT.

R. Oliver (8 h.p. Morgan). L. Martin (10 h.p. Singer). C. F. Halsall (10 h.p. Wilton). The starter (12 h.p. Rover).

General scene at the start of the speed trials at Brighton Vernon Busby (2¾ h.p. Sunbeam) is seen waiting for the word to go.

CLASS II. (standard touring machines up to 500 c.c.)—The expert section was run off in two heats, and in the final Cocker (Singer) beat Crawley (Triumph). The general section also was run off in two heats, and in the final Wilberforce (Norton) beat Meeton (Rudge).

CLASS III. (standard touring machines up to 750 c.c.)—In the expert section of the two winners of the previous heats who raced in the final, Ware (Zenith) beat Barnes (Zenith). In the general section Ware again came in a winner, beating Meeton (Rudge) and Barrs (Triumph).

CLASS IV. (standard touring machines up to 1,000 c.c.)—In the expert section Zeniths again were well to the fore, as Griffith came in an easy winner. Sumner (Zenith) was well to the front when his belt came off near the finish. In the general section Zeniths again scored, as Chapman, riding an 8 h.p., beat Trurler on a machine of the same make.

The Passenger Classes.

CLASS V. (touring sidecar machines up to 500 c.c.)—Among the experts Newsome (Rover sc.) won in excellent form, beating Pullin (Rudge sc.) and Matthews (Rudge sc.) In the general section, Sumner (Zenith sc.) beat Holroyd (Motosacoche sc.), whose machine appeared over geared.

CLASS VI. (touring sidecar machines up to 750 c.c.)—Experts, Ware (Zenith sc.) beat Barnes (Zenith sc.) and Newsome (Rover sc.) General section, Ware (Zenith) again won.

CLASS VII. (touring sidecar machines up to 1,000 c.c.)—Griffith (Zenith sc.) had a walk-over in the expert section. In the general section Chapman (Zenith sc.) won.

CLASS VIII. (touring cycle cars up to 1,100 c.c.)—Martin (Singer) led easily at the finish, but as he was disqualified for not having turned up for the examination, Oliver (Morgan) was counted as the winner. In the general section South, driving a water-cooled Morgan, had a walk-over.

CLASS XI. (any machine up to 350 c.c.)—In the expert section Le Grand (Singer) was first. Jacobs (Singer) was second, and Elwell (Douglas) was third. In the general section there were five heats, and in the final Elwell (Douglas) was the winner, Busby (Sunbeam) was second, and Heinzel (N.S.U.) third.

CLASS XII. (any machine up to 500 c.c.)—There were three heats in the expert section. In the final Pullin (Rudge) was first, Collier (Matchless), was second, but the third man's number was undecipherable. In one heat Buchanan's (New Imperial) carburetter came adrift, a misfortune which also happened to De la Hay in one of the preceding classes. In the general class there were also five heats. In the final O'Donovan (Norton) came in first, Keller (Triumph) was second, and Wilberforce (Norton) was third.

CLASS XIII. (any machine up to 750 c.c.).—There were two heats, and the final resulted as follows: Tessier (Bat) first, Cocker (Singer) second, and Crawley (Triumph) third. The general class was run off in two heats, the final resulting as follows: E. B. Ware (Zenith) first, O'Donovan (Norton) second, and Charlesworth (Zenith) third.

CLASS XIV. (any machine up to 1,000 c.c.)—The expert section was run off in two heats, of which Baragwanath (Matchless) won the first, and Griffith (Zenith) had a walk over in the second. In the final C. R. Collier (Matchless) was first, Griffith (Zenith) was second, and Baragwanath (Matchless) was third. In the general class the result was Remington (Matchless) first.

CLASS XV. (any sidecar machine up to 500) was won easily by Newsome (Rover sc.), expert.

CLASS XVI. (any sidecar machine up to 750 c.c.) was won by Ware (Zenith sc.), expert. Newsome (Rover sc.) ran second and Tessier (Bat) third.

CLASS XVII. (any sidecar machine up to 1,000 c.c.)—In this class generals and experts competed together. Of the former Griffith (Zenith sc.) was first, and of the latter Chapman (Zenith) was the winner.

Class XVIII. (any cycle car up to 1,100 c.c.)—In the expert class McMinnies, on his racing Morgan, romped in an easy winner, while South (Morgan) equally well distinguished himself in the general section. Viscount Exmouth, who ran a G.N., entered by mistake among the racing vehicles.

CLASS XIX. (any three-wheeled cycle car up to 1,000 c.c.—Here again McMinnies (Morgan) won easily.

CLASS XX. (any passenger machine up to 1,100 c.c.)—In this event sidecar combinations and cycle cars raced together and among the latter were two Morgans and a Calthorpe but Griffith (Zenith sc.) won the expert class, and Luce (Zenith sc.) won the general.

Inter-club Team Race.

The final event was an inter-club team race, which was run off in three heats, consisting of one man from each team. The result was as follows:

1. STREATHAM M.C.C. (6 marks).

Bateson (Douglas)	Tessier (Bat)
Pullin (Rudge)	Barnes (Zenith sc.)

2. *RICHMOND AND MID-SURREY M.C.C. (9 marks).

Buckeridge (Douglas)	Aston (Dot)
Carryer (Imperial)	Griffith (Zenith sc.)

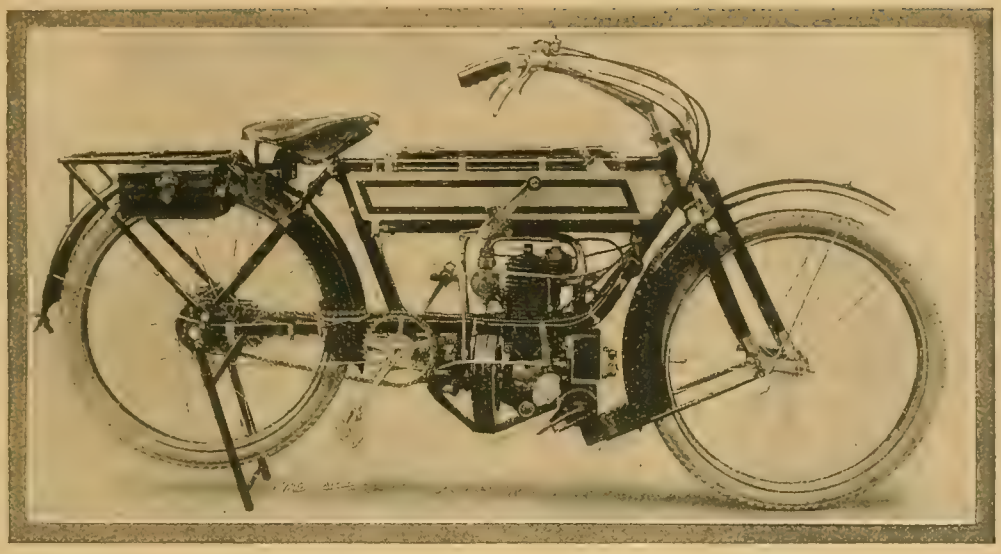
2. *PUBLIC SCHOOLS M.C.C. (9 marks).

Wilberforce (Douglas)	Getting (Bat)
Keller (Triumph)	Luce (Bat sc.)

*Tied for second place.

The 1914 MODEL 2½ h.p. F.N.

IMPROVEMENTS IN DETAIL ONLY.



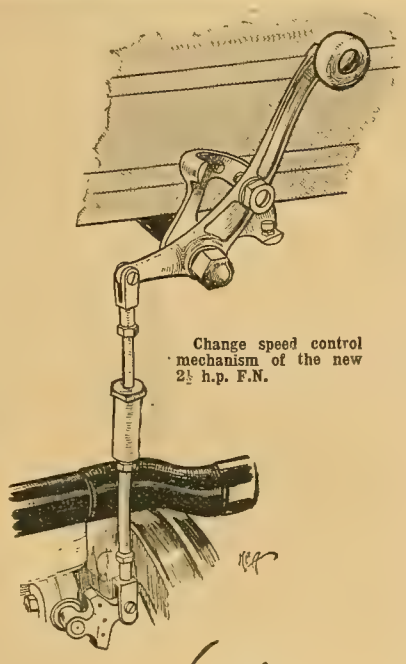
AT the time when the 2½ h.p. F.N. was introduced to the British public, it was a machine years before its time as regards design. is not surprising, therefore, to have record that the alterations found neces- y for 1914 are in detail only. How- er alterations in detail for the better, d the addition of refinements, will be ne the less welcomed.

An Oil-tight Engine.

In the case of the engine, the internal tions have been somewhat strengthened thout increasing the weight, and steps ve been taken to render it practically possible for any oil to leak from the gine or gear box. The valve caps have edges serrated, and there is a lock- device between them engaging with h, so that it is now impossible for the lve caps to come unscrewed.

The carburetter will remain practically same as in 1913, but an air valve s been fitted, the details of which are wn in the accompanying illustration. is valve consists of a ring, the inner face of which is ground out to fit a on the main body of the carburetter. e operation of moving the lever serves unscrew the sleeve gradually, so that variable amount of air is admitted rough holes in the seating into the pourising chamber.

An interesting detail on the machine, hich, however, is not a novelty is the pricating pump. Instead of being fitted with the ordinary type of leather washer it has two stepped piston rings in the plunger.



Change speed control mechanism of the new 2½ h.p. F.N.

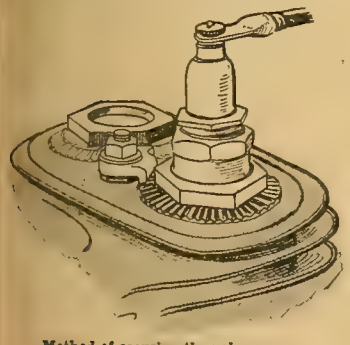
Gear Box and Change Speed Mechanism.

The gear box is now fitted with long phosphor bronze bushes, and the pinions have been strengthened. The change-speed lever has been altered for the better, and is now mounted on a pillar brazed on to the lower of the two parallel tubes of the frame. It is similar to that fitted to the 5 h.p. four-cylinder model, and a spring joint has been incorporated therewith, so that the gears may be engaged without shock and without straining the moving parts of the gear control. The inter-connected clutch lever has been abolished and an independent clutch control has been fitted to the handle-bar.

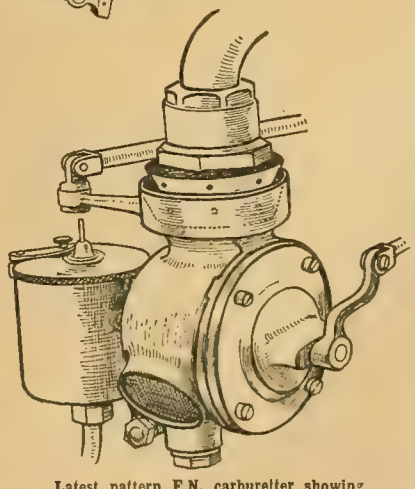
The handle-bar lamp bracket has been strengthened. New and slightly improved control levers to the carburetter and magneto have been fitted, while the seat pillar has also been altered for the better.

In addition to the above, Clincher beaded tyres are now fitted to all models. As an example to show how details are mention that as the exhaust pipe comes considered in designing the F.N., we may rather near the near side foot-rest, a small guard has been attached to protect the rider's boot.

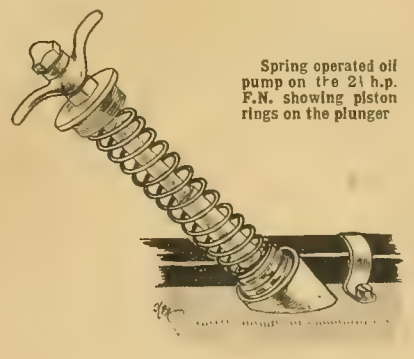
There are few machines with so much ingenuity in design and forethought in construction as the F.N.



Method of securing the valve caps on the 2½ h.p. F.N.



Latest pattern F.N. carburetter showing air valve.



Spring operated oil pump on the 2½ h.p. F.N. showing piston rings on the plunger

Club News

Harrogate and District M.C.C.

The series of three non-stop runs for the Pannal Trophy, kindly presented by Mr. W. Hill, and run on handicap, was brought to a close on 13th September. The two previous runs had accounted for a number of entrants, so that only five started for the last one, with the result as follows :

1, W. E. Grange (3½ Bradbury sc.), lost no marks, + 6 on handicap; 2, C. F. Smith (5-6 A.J.S. sc.), lost no marks, + 3 on handicap; 3, J. Brooke (5-6 A.J.S. sc.), late at one check, + 1 on handicap; 4, F. Strafford (3½ Triumph single gear), failed on hill, — 2 on handicap; 5, W. Hill (3¾ Scott sc.), failed to finish to time limit through punctures.

Bristol M.C.C.

The Bristol club held their members' hill-climb on Saturday last at Blagdon, and it must be written down as a complete success from start to finish. The hill chosen was about seven-eighths of a mile long, perfectly straight, and with a gradient of about 1 in 12 average. The surface was superb, and very fast times were made.

Among the interesting items was the re-entry into competition work of W. W. Douglas, who drove the new Douglas cycle car, while one member, a private owner, brought down no less than four machines.

The results were as follows :

Class I. (350 c.c.).—Milton, jun. Douglas), beat Milton, senr. (Douglas); W. W. Douglas (Douglas) walked over S. Pate (2¾ Humber); H. Wasley (Douglas) beat J. King (Douglas).

Second Round : Milton, junr. (Douglas) beat Fry (Douglas).

Final Round : Milton, junr. (2¾ Douglas) beat W. W. Douglas (2¾ Douglas).

Class II. (500 c.c.).—Final Round : J. B. Keller (3½ Rudge) beat H. Clement (3½ Triumph).

Class III. (Unlimited).—Final Round : H. Clement (3½ Triumph) beat W. J. Shaw (6 A.J.S.).

Class IV. was for 500 c.c. machines and sidecars. There were not sufficient entries and this class was abandoned.

Class V. (Sidecars, Unlimited).—Final Round : G. H. Fry (8 Zenith sc.) beat H. Hutchinson (6 Trump-Jap sc.).

Class VI. (Cycle cars).—First Round : W. W. Douglas (Douglas cycle car) beat J. Cates (Morgan); W. J. Cox (Morgan) beat Potter (Morgan).

Final Round : W. W. Douglas (Douglas) beat W. J. Cox (Morgan).

This was the first public appearance of the new Douglas cycle car in competition, and great interest was shown in its performance. It was fitted with a streamline body.

Class VII. (Novices, 500 c.c.).—G. H. Fry entered both a 3½ Rudge and a 3½ Singer and got them both in the final, so was a double winner.

Walthamstow M.C.

The Henbury Cup competition was held on 21st September over a fifty-mile course, which had to be covered non-stop at twenty miles per hour; watches and speedometers being barred. Result :

1, F. Cudden (3½ Kerry-Abingdon sc.), time error 26s.; silver cup and gold medal; 2, J. H. Kerr (6 N.S.U. sc.), 1m. 5s., gold medal; 3, J. Percival (8 Chater sc.), 1m. 13s. gold medal; 4, R. S. Lisles (5½ R.S.L. cycle car), 1m. 44s., gold medal.

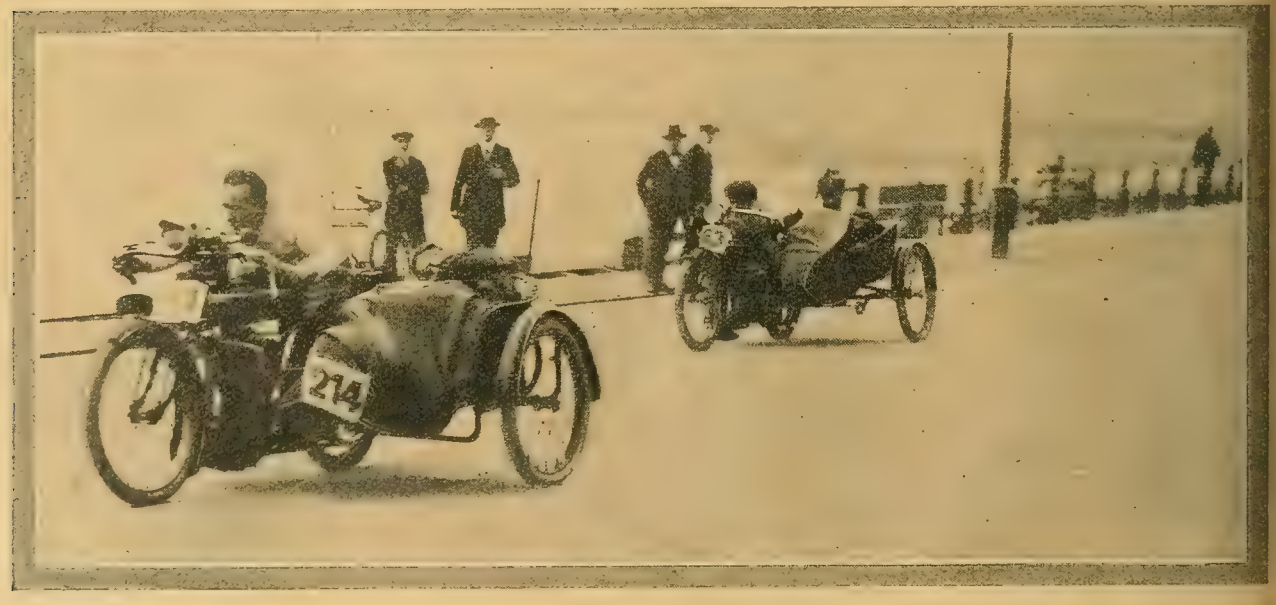
Cheltenham M.C.C.

The third of the series of trials for the Williams Challenge Bowl will be run off on Saturday, September 27th. Mr. F. W. Corbett has kindly offered a prize for the best performance by an amateur. Silver spoons will be given to all who gain full marks. Competitors meet at the Belle Vue Hotel at 1.30, and the first man is due off at two o'clock. The first half of the trial will contain three non-stop sections : (1) from Winchcombe to the Sutton Coldfield hairpin, (2) from Withington to the five cross roads, (3) from Cowley to Birdlip. Competitors must arrive within ten minutes of schedule at Birdlip. The second half of the trial must be taken non-stop throughout, and to gain full marks competitors must finish within one minute of correct time at the Belle Vue Hotel, Cheltenham.

THE MOTOR CYCLE DIARY.

Sept. 27th to 28th.—Walthamstow Motor Club Run to Clacton.

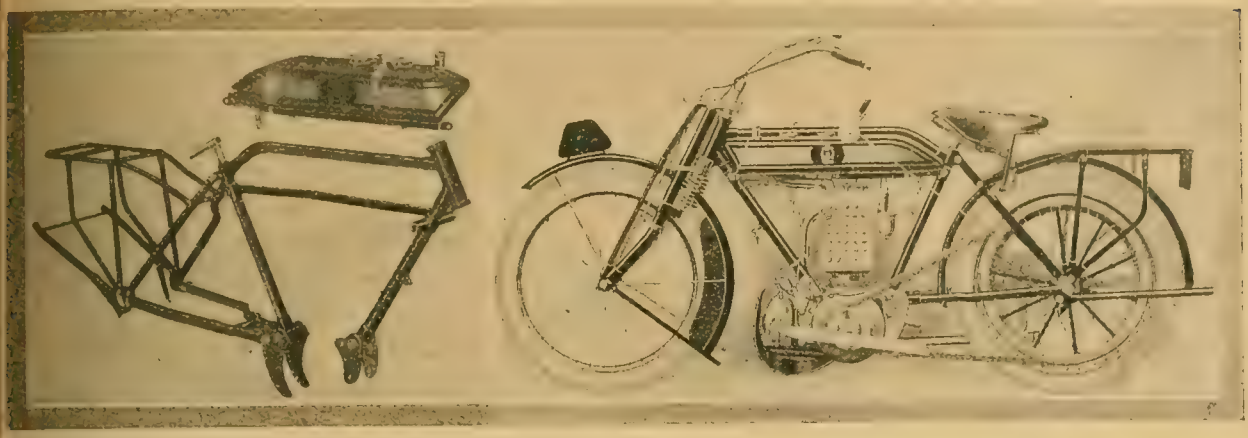
Sept. 27th.—Inter-club Hill-climb between the Oxford M.C.C. and the Middlesex M.C.C. at Alms Hill, Henley, at three o'clock.



AT BRIGHTON. A close race between A. V. Sumner (3½ h.p. Zenith-Green) and J. S. Holroyd (3½ h.p. Motosacoche).

The New Comet for 1914.

A Special Low Frame to Accommodate the Green Water-cooled Engine.



The special frame showing the duplicated tank rails.

1914 mode three-speed New Comet-Green.

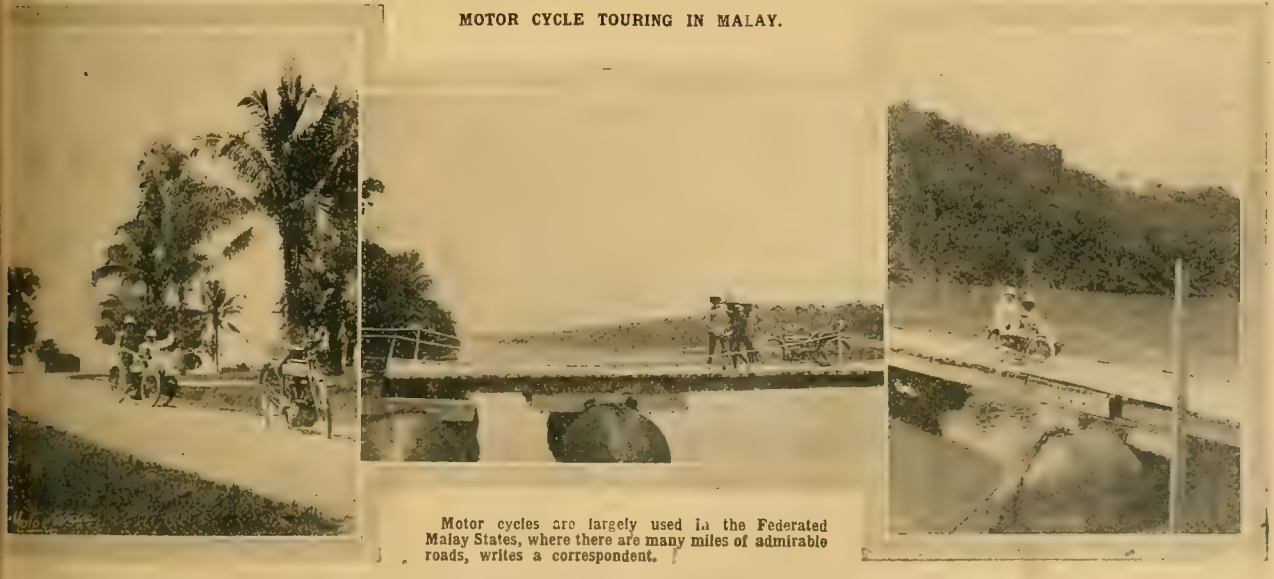
MR. A. H. HADEN, of the New Comet Motor Cycle Works, Princip Street, Birmingham, has taken over the Regal-Green motor cycle business, and will in future manufacture these machines fitted with the Green engine, special frame, and tank. We reproduce an illustration of the 1914 model, the principal feature of which is the special frame constructed to take the Green engine without increasing the height of the saddle from the ground or decreasing the clearance between the base of the crank chamber and the ground. The bottom rail is duplicated, and constructed of square tubing cranked at each end, and secured to the lugs on the seat tube and down tube by special pins and nuts. To detach the tank, all that is necessary is to undo the nuts, when the tank and one side of the tube on which it rests can be removed bodily. This leaves a clear open space for removal of the cylinder.

Three-speed Gear Improvements.

The latest model of the New Comet three-speed gear has an improved control for the change speed, by means of a lever on the right-hand side of the machine working in a long quadrant, which is attached to the bottom rail. The quadrant is notched for the three speeds and neutral position, and the operation is on car lines. The clutch control pedal is now pushed forward to release the clutch, instead of sideways as formerly, and the clutchshaft is supported on an outside bearing, which also takes up the thrust of the cone. On the new pattern, the internal portion of the clutch cannot touch the back plate of the external part, as a stop is provided to prevent the pedal being pushed forward too far.

In addition to complete New Comet machines, Mr. Haden makes a large number of frames to special designs for the trade and other requirements.

MOTOR CYCLE TOURING IN MALAY.



Motor cycles are largely used in the Federated Malay States, where there are many miles of admirable roads, writes a correspondent.

Our photographs show—1. A scene in the grounds of the Rajah of Perak's Palace. 2 and 3. The Pontoon Bridge at Enggor. All the machines are Triumphs.

Question & Replies

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Watford to Kendal.

Will you kindly send me the best route from Watford to Kendal *viâ* Preston, avoiding tram tracks and large towns?—S.S.D.

We cannot give you a route from Watford to Kendal avoiding tramlines if you go *viâ* Preston. The following is the best we can do: Watford, Berkhampsted, Aylesbury, Bicester, Banbury, Stratford-on-Avon, Alcester, Bromsgrove, Kidderminster, Bridgnorth, Wellington, Whitchurch, Tarporley, and Warrington. If you turn left and follow the road signposted by the R.A.C. *viâ* Rainhill, Prescot, Rainford, Ormskirk, and Rufford to Preston, you will avoid most of the tramlines. After Preston continue through Garstang and Lancaster to Kendal.

The Question of H.P. Rating.

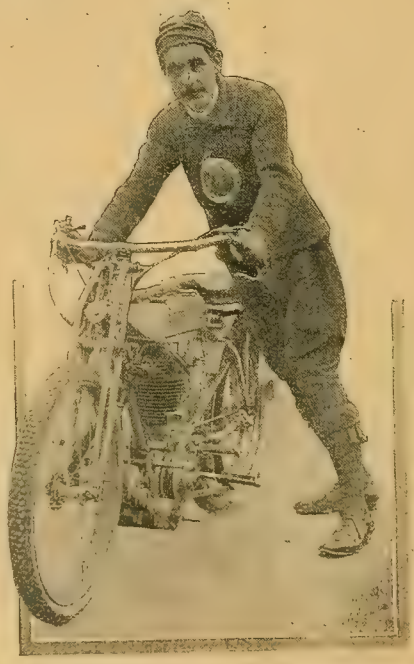
Will you kindly tell me the why and the wherefore of R.A.C. rating of motor powers? To the uninitiated it is puzzling when comparisons have to be made with American cars which are specified as so many b.h.p. What I wish to know is, why does not the R.A.C. rating agree with the brake tests? A full explanation would be appreciated.—C.C. (South Africa).

The R.A.C. rating was adopted some years ago in order to supply a rough and ready method of comparing various engines then on the market. All formulæ are distinctly complicated, and the desire for simplicity led to the stroke of the engine being neglected. In consequence thereof the formula does not give any idea of the real horse-power developed by an engine with a long stroke. American cars are not generally classified as so many brake horse-power, and the brake horse-power is always larger than that obtainable from an engine when it is placed in the chassis, owing to transmission and other losses, which will be obvious. The R.A.C. rating was evolved in order to show the power of the car, and is therefore not comparable with the brake horse-power given. It was the opinion of the Committee that the long stroke engine would run at such a speed that the formula would give an approximately even result. At the present time the speed of revolution of the long stroke engine is very much higher than was the case with the old short stroke, and accordingly the formula is of little service. If it is necessary to compare one engine with another, the best thing to do is to find the cubic capacity of each engine, which will give a reasonable idea of the power to be obtained.

Case Hardening.

I have turned a new cone for the ball bearings of my sidecar wheel, and should be much obliged if you can tell me how to case harden the same. I find that making the cone red hot and cooling in linseed oil does not harden it sufficiently.—J.A.T.

Case hardening is rather a difficult matter and requires a lot of practice. The art is in heating the metal to the required colour, and only after a lot of practice can this be done. It should then be immersed in one of the recommended hardening compounds, which you should be able to get from one of the big factors. Hardening, however, is best carried out by experts in this particular class of work.



W. E. Waddington, the active president of the North Derbyshire Motor Cycle Club. He rides a 3½ h.p. Campion-Precision, and enjoys competition work.

Endorsement of Licence.

I have recently been fined for refusing to stop when requested by a police officer on point duty. Both I and my wife gave evidence that we did not know we were asked to stop. I had no other witness, it being a month after the occurrence when I got the summons. They asked for my licence, and on getting same back I find they have endorsed it. Can they do this, and if so how long will this stay on my licence?—J.D.

If you were convicted for the offence alleged against you the authorities have a perfect right to endorse your licence, which may be done in the case of every offence against the Motor Car Act connected with the driving of a motor car, except the first and second occasion upon which you may be convicted for exceeding the speed limit. The endorsement is a permanent matter, and is carried forward from one licence to another.

The Position of Number Plates.

You will probably be aware of the present epidemic of summonses for driving with rear number plate obscured by the clothing of the passenger on pillion seat. It occurred to me that this trouble might be avoided, in the case of sidecar outfits, by transferring the number plate to the luggage carrier of the sidecar, where it would be equally conspicuous. Questioned as to the legality of such a transference, two police constables expressed the opinion that it would be quite in order, but the local taxation officer says "No," on the argument that the plate must be fixed to the registered part of the machine, which is the cycle only; while a solicitor friend considers that even if it be technically irregular to have the plate on the sidecar, no court would convict so long as the number plate is plainly visible. Perhaps you will kindly have a word with your legal expert and publish a considered opinion, which, I am sure, would interest a large number of sidecarists.—J. MacI.

We have submitted your letter of the 29th ult. to our legal adviser, who replies as follows: "The plates should be kept in the same position as agreed on when application is made for the registration of the motor cycle. In filling up the form, paragraph 7 requires the applicant to give particulars as to the position where it is proposed to place the plates. I think that, strictly speaking, the plate should be fixed on the registered part of the machine If, however, in

registering the motor cycle, it was put in that it was intended to fix the plate sometimes at the back of the motor cycle and sometimes at the back of the luggage carrier, and this was passed at the time, there would be something in favour of your correspondent's contention; but even then the regulation distinctly provides that the plate must be put on the back of the motor car (which, of course, includes motor cycles), unless the plate has duplicate facings, as specially provided for motor cycles. It would certainly be a little risky for your correspondent to put the plate at the back of the sidecar, but, as his solicitor friend points out, so long as a number plate is plainly visible at the rear, I can hardly imagine the justices convicting for what would be a technical offence."

Taking a Machine to Ceylon.

I should be glad if you would reply to the following queries: Cost of transit of a motor cycle from England to Colombo. Duty charged on used machine. General advice regarding best type of machine to take out there.—A.J.P.

The cost of transport from London to Colombo would be £2 3s. 9d., and the duty would be 5½% *ad valorem*. Any well-known make of machine would suit you for use out there, but it should be capable of climbing any hill, as the roads, though fairly good, are exceedingly hilly. There are a large number of motor cyclists in Ceylon.

A Week's Tour.

(1.) Will you please state the best route from South Shields, Durham, to Exmouth, Devon? (2.) How to return through Wales, touching Conway, Windermere, then to Carlisle, and from Carlisle to South Shields? (3.) About how long should it take a 3½ h.p. three-speed Triumph with sidecar to do this run? (4.) What is the approximate distance?—H.P.

(1.) Your best route would be as follows: South Shields, Chester-le-Street, Durham, Darlington, Northallerton, Boroughbridge, Wetherby, Aberford, Ferrybridge, Doncaster, Worksop, Mansfield, Nottingham, Loughborough, Leicester, Coventry, Kenilworth, Warwick, Stratford-on-Avon, Winchcombe, Cheltenham, Painswick, Stroud, Bath, Radstock, Wells, Glastonbury, Durston, Taunton, Cullompton, skirting Exeter, Topsham, to Exmouth. (2.) For the return journey from Exmouth, follow the route we have given as far as Bath, then go through Mangotsfield and Filton to Pilning, by train to Severn Tunnel Junction, then through Chepstow, up the Wye Valley to Monmouth, Hereford, Leominster, Ludlow, Montgomery, Oswestry, Chirk, Llangollen, Corwen, Bettws-y-Coed, Llanrwst, Conway, then round the coast through Colwyn Bay, Rhyl, Holywell, Chester, then make your way north through Warrington, Wigan, Preston, Garstang, Lancaster, Kendal, to Windermere, Troutbeck, Kirkstone Pass, Ullswater, Penrith, Carlisle, Alston, Hexham, Newcastle, South Shields. (3.) We have not the slightest idea how long you wish to spend on this journey, but we should say it would be a good week's tour. (4.) The distance will be approximately 750 miles.

Mysterious Loss of Power.

I have a 2¾ h.p. 1911 three-speed New-Hudson motor cycle, which I bought second-hand early in the year. Up to quite recently it has run splendidly. The last few days I have been away on holidays, and the machine has seemed to lose all power. Hills that it would quite easily take recently on top gear I have a great difficulty in making it even crawl up on my lowest gear. I have taken off the cylinder and cleaned all carbon deposit from it, and also the piston top, but find no improvement whatever. The compression is good, and the carburetter jet quite clean. When riding the other evening I noticed that when the throttle had been opened full for a short time the engine misfired several times, and gradually ceased firing altogether until I altered to low gear, when it immediately fired again quite regularly. This happens when trying to climb a hill on top gear. The timing has not been altered in any way so far as I can tell. The engine gets plenty of Price's oil, and I have recently fitted a new Sphinx sparking plug. The engine is a 2¾ h.p. J.A.P., fitted with automatic inlet valve. Do you think the trouble is caused by the automatic inlet valve, or do you think the engine requires rebushing? There is a little play in the pulley bearing. Would this account for such rapid loss of power? I should be greatly obliged if you could help me in any way.—J.A.H.

It is quite possible that the loss of power may be due to a weak exhaust valve spring; in fact, the symptoms mentioned in your letter lead us to suppose that this is the case. A very weak exhaust valve spring will cause misfiring in very much the same way as faulty ignition. Also look to your automatic inlet valve and see that the spring is in good order. The fact that the engine may require rebushing would not account for the loss of power. If it requires rebushing this can be perceived by a knocking sound in the bearings. We think you will find that new valve springs of correct strength will cure your troubles.

READER'S REPLY.

Engine Stops when Hot.

The replies in *The Motor Cycle* of September 11th from your correspondents LF 2563 and Mr. A. Elliott exactly endorse my own experience with a 1913 Douglas. As soon as I opened the throttle to any extent the engine would "dry up" after a few hundred yards, but since substituting two single point Bosch plugs the trouble has entirely disappeared.—OI 385.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"W.C.H." (Stockport).—G.W.K. or other friction gear after twelve months' wear.

"H.E.S." (Brockley).—3½ Premier with two-speed counter-shaft or three-speed hub gear, for sidecar work. Power, reliability, etc.

"E.T." (Harwich).—Electric head lights as compared with acetylene outfits. Reliability, life of bulb, and hours of light given. Also cycle Klaxon, operation and efficiency.

POSITIONS OF PASSENGERS IN HILL-CLIMBS.

G. G. Barnard (Singer sidecar) just past the first bend of Pen-y-Ball, the venue of the recent Mersey M.C. Open hill-climb. Nowadays passengers adopt such queer attitudes that it is difficult to tell which is the driver's and which is the passenger's head.

A Successful Record.

Recent wins on Midland tyres and belts include a gold medal at the Stockport and District M.C.C.'s Open Hill-climb, first place in the two miles scratch race at the Portmarnock Meeting, and the silver trophy in the Dublin and District M.C.C. White Cup Trial.

The Wooler Two-stroke.

The Wooler Engineering Company, the manufacturers of the Wooler two-stroke motor cycle, have taken offices at 453, Strand, London, W.C. Mr. John Wooler, the inventor of this machine, has, we understand, now severed his connection with the Wilkinson T.M.C. Company, Limited.

The Motosacoche in London.

Messrs. Sydney Westall, Limited, 143-145, Great Portland Street, W., have taken up the sole London selling agency for Motosacoche motor cycles. They will carry a full stock of spare parts, exhibit samples of each model, keep demonstration machines, and act generally as a branch depot to Motosacoche, Limited. Messrs. Motosacoche, Limited, are in the future concentrating their business at their spacious works at Willesden.

The Endrick Two-speed Gear.

A simple two-speed gear applicable to standard machines is likely to be well received by the public. Such a gear is now marketed by the Endrick Engineering Co., Warwick Road, Olton. The gear is remarkably simple, and should be as frictionless as possible, for there are no gear wheels employed in its construction. Two chains transmit the power to the counter-shaft, a slipping device being fitted to absorb and jerk on top gear. The final drive may be either by belt or chain. The driven sprockets may be locked to the counter-shaft at will by means of a toe and heel pedal which operates expanding clutches through the medium of a quick thread screw and a single arrangement of wedge bars. The feature of these clutches is the large area of contact which is obtainable owing to their special construction. One model of the gear will be marketed in such a form that by removing the pedalling gear from Triumph machines they may be fitted at once with the Endrick gear. The gear appears well made, and we hear that some large concerns are experimenting with it.

A Douglas in Kensington Museum.

Messrs. Douglas Bros., Kingswood, Bristol, have just supplied one of their 2¾ h.p. Douglas motors, complete with carburetter and magneto, the whole unit being mounted on a stand, to the South Kensington Science Museum, S.W.

Philipson Pulleys in Speed Events.

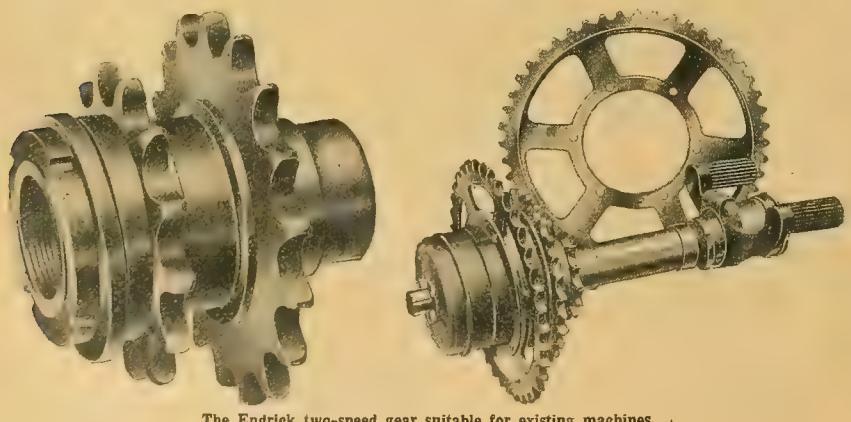
In the Scottish motor cycle championships at St. Andrews, the first three riders in the 500 c.c. race used Philipson governor pulleys. The Triumph riders, S. Crawley and E. W. Cheshire, tried their machines with and without the pulleys, eventually deciding to adopt the governor device. A. J. C. Lindsay, who was second, also used the same make of pulley on his Rover.

The Paraband Seamless Horn Bulb.

A seamless horn bulb has been submitted to us for examination by the Paraband Tyre and Rubber Co., 26, Page Street, Westminster, S.W. The advantage claimed by the makers is that this bulb, being seamless, cannot split. The rubber seems to be of excellent quality. A taper split ring and screw-on collar provide a universal joint. No solution is required to fit the bulb, and this joint makes it airtight. The bulb is made in six sizes.

A New Waterproof Material.

A sample of new waterproof, which is being imported, has been submitted to us. This material is suitable for being made up into a waterproof cover for a motor cycle. The advantages claimed for this material are (1) that it is indefinitely waterproof, (2) that it does not crack, (3) it is exceptionally light, and (4) it is easily carried on the machine, or in a sidecar door pocket. We would add a further advantage; this material might serve as a suitable covering for the sidecar passenger in addition to the usual apron. It is sold by Mr. A. Dudley, 2, Bond Street, Birmingham.



The Endrick two-speed gear suitable for existing machines.

Motor Traders' Dinner.

The eighth annual banquet of the Cycle and Motor Trades Benevolent Fund will be held at the Connaught Room, Great Queen Street, W.C., on October 9th, at 7 p.m., when Mr. S. F. Edge will preside.

Coventry Track Record.

On the occasion of the Rover Sports, Coventry, on 13th September, we understand that the track record for five miles was lowered by G. W. Baker, riding a 3½ h.p. Veloce by 1m. 20s., the previous best time being 8m. 49s.

Racing in Belgium.

At the recent Spa automobile race meeting, Belgium, the Coupe de la Meuse for motor cycles was secured by G. F. Liefeldt, of Coventry, on a 3½ h.p. Rudge Multi, fitted with Continental tyres. He made the fastest time, and was also first on formula. It may be noted in passing that the great event of this race meeting, the Coupe de la Meuse for motor cars, was also won on tyres of this make.

Heavy Covers for Rear Wheels.

In the recent Six Days Trial the A.J.S. sidecar, driven by A. J. Stevens, had an Avon 650 × 65 combination cover fitted to the driving wheel. Mr. Stevens has written to the Avon India Rubber Co. saying that this year was the first Six Days Trial in which he has been able to run on one driving tyre throughout. He had not the slightest trouble, and its non-skid qualities enabled him to climb the severe gradients without any suspicion of slip.

Tyre Successes.

The following recent successes have been attained on Dunlop tyres: W. H. Longton, when he won the P. J. Evans rose bowl and gold medal in the Birmingham M.C.C. trial; A. J. Dixon, on the occasion when he gained a gold medal and the plaque d'honneur given by the City of Liège for the best performance by a foreigner in the Liège-Paris-Liège Trial and the prize presented by the Moto-Club Liègeois; and Vernon Busby, who gained gold medals in the Scottish and English Six Days Trials.

A Real Weatherproof Leg Cover.

No waterproof garments sold to motor cyclists have been more successful than the Hutchinson waders, sold by the Hutchinson Tyre Co., 70, Basinghall Street, E.C. These keep the trousers and boots absolutely dry and clean, and are quite impervious to the most drenching rain; in fact, they may be washed by wading in a stream. They are a development of the ordinary wader used by fishermen, and since they have been adapted to the use of motor cyclists they have been considerably improved from the original pattern. The proofing material is now of a much better quality, and both the uppers and the boot itself have been strengthened

Catalogues Received.

We have received a catalogue of Godiva sidecars from the Godiva Sidecar Company, Limited, Spon Street Works, Coventry. This catalogue contains full particulars, and has some excellent coloured plates of their various models.

SOMETHING TO CROW ABOUT
Watawata Belt
Booth's Patent.
A FEW MORE EXPERIENCES OF DELIGHTED USERS—
1,281 miles without tightening, and not a single stop on the road for transmission troubles.
2,000 miles, much of it with sidecar, and no shortening—it never slips.
The only belt that has worked on my pulleys without twisting.
Having run it 1,441 miles I cannot see that there is any appreciable wear.
The belt has been quite a revelation.
THE MOST EFFICIENT MOTOR CYCLE BELT BECAUSE THE MOST SCIENTIFICALLY CONSTRUCTED.
Send for Booklet—

£10-10-0

Ten guineas is all it costs to bring your mount up-to-date by the addition of the

1913½ ROC LATEST

SIDECAR PATTERN

Two-speed Gear.

(6 Days' World's Sidecar Record type)

The 1913½ big clutch type has been designed expressly for passenger work.

It solves all gear worries and guarantees you satisfaction.

The 1913 Roc gear was already recognised the last word in motor cycle gears for solo use.

The 1913½ big clutch type is just what thousands of "sidecarists" have awaited and expected.

The Roc gear was the first of all motor cycle gears—it is the first to-day. Nothing could be smoother, easier to operate, or be more reliable.

No better investment for the money is possible than in this 1913½ Roc dependable gear, fitted complete for ten guineas.

Write for particulars, stating make and h.p. of your machine.

No delay in delivery.

YOU CAN'T GO WRONG

if you consult us before purchasing your next motor bicycle or cycle car. Our one aim is to satisfy **YOU**, as in so doing we ensure the success of our own business.

We can give you the best advice obtainable as to the machine most suited to your particular requirements, and our opinion is quite unbiassed, as we are contractors for **all** the best machines and do not centre our interest in any one particular make. If you are buying a new motor cycle or cycle car we will allow full value for your old one in part payment, and if it is a convenience to you we will accept payment of the balance in MONTHLY INSTALMENTS.

We also accept deferred payments for second-hand machines, and give delivery upon receipt of the first instalment.

All our second-hand motor cycles are minutely overhauled, and we give a **WRITTEN GUARANTEE** with each one.

Place your order with us. **YOU CAN'T GO WRONG.**

COLMORE DEPOT

for Motor Cycles and Cycle Cars

NO BUSINESS METHOD WHICH WORKS TO THE DISADVANTAGE OF THE BUYER CAN IN THE LONG RUN WORK TO THE ADVANTAGE OF THE SELLER. Those who control the policy and destinies of the Colmore are BUSINESS MEN besides being motor cyclists, and they realise this to the full.

SMALL PROFITS PAY

Enquiries and sales cost too much in the first instance to make one small profit pay. It needs a customer to be FULLY SATISFIED, and to come again and again to make business profitable. THINK of these principles, integal parts of the COLMORE METHOD, which makes SATISFIED COLMORE CLIENTS.

They would rather deal often, EVERY TIME for a small profit, than ONCE for a large one.

When you have thought well on this you will realise that by dealing with the Colmore you will prove the SOUNDNESS of your OWN judgment. They are the firm for you as a keen, sane buyer.

"FOR YOU ALONE" (perhaps).

PREMIER, 1911, 3½ h.p. free engine.. .. .. **£25**

Night Riding.

NOW that the hours of daylight are rapidly decreasing more interest will be taken in subjects which deal with riding after dark. It has already been suggested that motorists should show an example to other road users by lighting up half an hour before the legal time—an excellent suggestion, as there is no doubt that more collisions take place in the twilight than at any other time, and it might be even advisable to adopt the same rule with regard to lighting lamps as at sea, where lamps are lit at sunset and extinguished at sunrise. If anything, there is more light on the sea than on the land, and if it is considered a necessary safeguard to show a warning light on shipboard from sunset to sunrise it should be equally advisable on the road, and it certainly imposes no hardship.

There, are, however, other items which might reasonably receive attention from the authorities, and one of the most important is that on tarred main roads it is extremely difficult when riding at night to see pedestrians and cyclists unless they happen to be wearing light coloured clothes. Now cyclists can safeguard themselves at all times by red rear reflectors, if they purchase those which are suitable and affix them correctly, *i.e.*, with lenses perpendicular to the road.

It is astonishing the number of stony-covered footpaths which run along main roads which are tarred. Under such circumstances it is quite natural for pedestrians to walk on the smooth road surfaces in preference to the path. If path and road were treated in the same manner pedestrians would use the footpath in preference to the road, and so leave the latter open for the faster traffic.

We have noticed when riding on tarred roads after dark that it is often difficult to detect the border line where the road merges into the grass edging or footpath as the case may be. When these roads are tar treated it should not be a difficult matter to lay a narrow strip of white road material down each side of the road which would prevent any possible chance of colliding with a raised footpath or kerb. On some roads the authorities have commenced to paint a white strip on the telegraph posts, which is distinctly sensible because these posts are nearly always tarred and practically impossible to discern against the background of a dark hedge or in any position where the light behind them is in any way obscured.

Hints and Suggestions.

WHILE on this subject of night riding we would particularly point out that the best plan to adopt in connection with acetylene gas lamps is always to keep them clean and well adjusted, filled with carbide and water, and when riding along if the water tap be turned on a few minutes before lighting up time arrives the gas generation can be quickly discerned by the scent, and then the lamp can be lit from the saddle by one of the patent strikers on the market. We suppose it is almost too much to ask motor cycle makers to agitate for the handy dynamo lighting sets with which cars are equipped, but we venture to think that more safe night riding would be done if small reliable dynamos were supplied in motor cycle form which would enable the road to be flooded with light at the mere turn of a switch. It may be recalled that in our article forecasting the possible improvements "Ten Years Hence," several experienced writers suggested that a very desirable feature of future motor cycles would be an electric lighting set, and in the light of recent developments on cars in the way of electric engine starters and change speed devices, an electric lighting set does not seem a great deal to ask for.

In writing the above we know that there are one or two dynamos on the market for lighting motor cycle lamps, but they are very much in the minority, yet we think it would pay some enterprising firm to put a small set on the market, particularly for sidecar combinations where the battery could be carried in a cupboard of the sidecar seat. The illuminating power of acetylene gas is too well-known to require any reference, and whatever is introduced in the electrical line, the gas generator and lamp will probably always be the lighter in weight if not in handiness. But to be able to switch on all lamps at a moment's notice and to be assured of a bright and fairly powerful light through a constantly charged battery, would quite recompense the user for any slight falling off in the penetrating powers of the light.

Anyway, we look forward to lighting our machines in this manner before many more seasons have passed, while for sidecar outfits we venture to predict an early date for the installation of a head light, sidecar lamp, tail lamp inspection torch and cigar lighter, all electrically lighted by a neat little dynamo installation.

A GOOD TESTING GROUND.

THOSE who desire to test their machines to the limit should follow the course of a run held recently over a most unusual course by the Birmingham M.C.C. The route to be taken is to Llanidloes, *via* Shrewsbury and Welshpool. Arrived there, the double journey to Machynlleth and back, *via* the mountain road—if it can be called a road—is followed.

The road is entered upon after crossing the River Severn to the right of the entrance of the town. The Contour Books describe the road as "An utterly impossible route, consisting of a series of precipitous hills, utterly unrideable up and highly dangerous down."

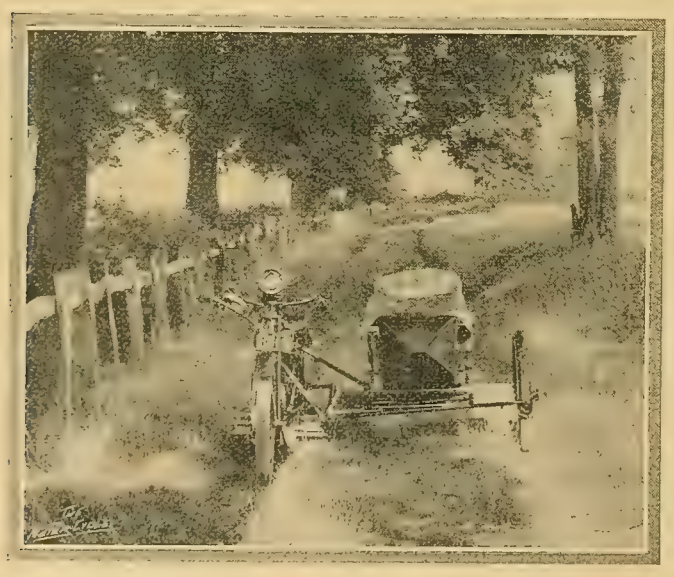
The road is said to be far more severe than anything there was in the much-talked-of Six Days Trials, and it is forty miles long. Shale surface, then rocks, then grass-grown track, watersplashes, precipices, and gulleys form the greater part of the stretch between Llanidloes and Machynlleth, and those in search of a really exciting ride should try this route. The run referred to above was the annual captain's run of the Birmingham M.C.C. Despite the terribly difficult course the event was won by a sidecar machine, viz., W. H Egginton, on a 6 h.p. Enfield and sidecar.

A sample of the roads in Wales traversed during the Captain's run, recently held by the Birmingham M.C.C.

72½ Miles in an Hour on a 10 h.p. Singer.

ON the morning of the 24th of September, the Singer cycle car, driven by Haywood, made an attempt on the nine hours' record. Unfortunately at the end of fifty laps a tappet roller gave out, owing to being over-hardened, and the vehicle had to be withdrawn. It had, however, by then singularly distinguished itself. The fifty miles were covered in 41m. 28⅗s., 72.33 miles an hour previous best 47m. 50⅗s. One hundred miles were covered in 1h. 22m. 49⅕s., 72.44 miles an hour previous best performance 1h. 37m. 51⅕s. In the hour 72 miles 976 yards were covered, which means that the magnificent speed of 72.55 miles an hour was averaged. The previous best performance in the hour was 62 miles 1,136 yards. All the previous best performances mentioned above were accomplished by Haywood on the 10th of May this year. Haywood's fastest lap on Wednesday was his nineteenth, which he covered at the rate of 74.12 m.p.h. The vehicle was measured and weighed after the performance, and everything was found to be in perfect order. The chassis weight with tanks and with oil in the crank case was 660 lbs., or 12 lbs. under the limit. Palmer tyres were used, which weigh 1½ lbs. per tyre more than the covers used by Singer's on previous occasions. The Singer engine is of 1,096 c.c.

It is interesting to compare these speeds with other class records established at Brooklands. The hour record in the 500 c.c. motor cycle class still stands to the credit of G. E. Stanley, who on the 15th of October, 1912, covered 67 miles 782 yards in the hour on his 3½ h.p. Singer. The twin 1,000 c.c. record is not so impressive, in comparison, as 70 miles 1,388 yards still stands to the credit of the late A. J. Moorhouse on a 7 h.p. Indian.



A Colonial model Rudge sidecar which has a clearance under the chassis of 10in. The track is 4ft. 8½in; further, it has four point attachment. The one illustrated is destined for Canada.

OCCASIONAL COMMENTS
by "IXION"

Mixture Detectors.

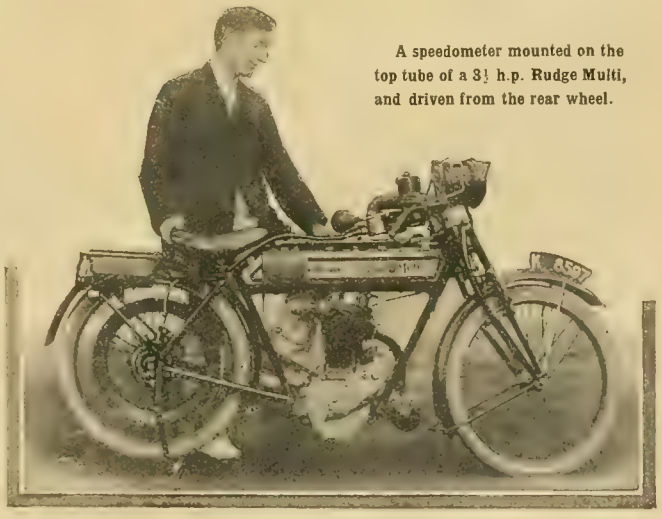
The E.I.C. quartz window sparking plug adapter, which is intended to be used as a mixture detector on the basis of the colour of the flame of the explosions, should have a good sale. It is similar in principle to the Calvert quartz sparking plugs, which were sold as far back as 1903. But its manufacturers have evidently forgotten that the sparking plug aperture on many modern cylinders comes directly under the tank, and so fails to afford sufficient clearance for their device to be used. I hope they will bring out an alternative model with an elbow in it, for the quartz cylinder window is of real value in tuning up a carburetter.

Candour and the A.C.U. Judges.

I thoroughly agree with "Sparks" that the A.C.U. judges are either too timorous or too modest: possibly they remember the hot water into which their route cast them, and shun further unpopularity such as a little frank criticism might bring: possibly they have crept into their shell, and fancy that the motor cycling public is no longer interested in the facts they have elicited and the opinions they have deduced from those facts. In either case they are wrong: they have lost—or, may we say, merely postponed—a golden opportunity of rehabilitating themselves. Their report might have been composed by a perfect diplomat with the idea that it should be read to a grand assembly of the Society of Motor Cycle Manufacturers, and exercise a most mollifying effect upon them. As it stands, it is not worth the paper it is written on. It tells us a great many things we knew long ago—"record entry," "very stiff course"—"British team deserve hearty congratulations," and much similar flapdoodle. But at the end seven headings aroused faint promise of really valuable information, but here we find the briefest paragraphs of this very precious document ruined by a pusillanimous anonymity.

Speedometer Drives.

It is evident I am not a voice crying in the wilderness when I draw attention to the noise and rapid wear inseparable from the naked driving gears located at the front hub, for the paragraph has produced quite a bulky correspondence. I illustrate a Rudge belonging to Mr. F. R. Stuart, of Blundellsands, which has its speedometer neatly mounted on the top tube (as I recommended) by means of fittings sold by Mr. G. Wray, of Southport, Hugh Gibson's quondam riding associate. So far as this machine is concerned, I commend the dial fitting only, and not the rear wheel drive, though those who like a rear drive can obtain the Stewart speedometer equipped for the purpose, not to speak of Mr. Wray's fittings for adapting other makes. But, personally, I see little to choose between the rear and front wheel drives so far as silence and durability of the gears are concerned. Indeed, the rear wheel position is the worse in these respects, besides offering possible inconveniences when the wheel has to be removed or adjusted, and its chief merit is that it lends itself better to top tube dial fitting. Since I wrote my notes of September 18th it has occurred to me that a silent encased and self-lubricating drive for a top tube dial might well be arranged from the standard magneto transmission. Existing magneto chain cases are normally of the dumb-bell pattern. If they were arranged to include a gear wheel for driving the speedometer the case would either have to be altered to a banjo shape, or else one end of the "dumb-bell" would have to be made deeper. If one of our large factories, with an output of 5,000 or 10,000 machines per annum, were to incorporate such a provision in the magneto drive, any speedometer maker would gladly standardise an instrument to suit, and the machine would not be disfigured from the standpoint of those riders who do not use speedometers, for the opening left for the shaft and sheath in the top of the magneto chain cover could be neatly closed by a small cap. The plan would give us a silent and durable drive in conjunction with the top tube dial position: and the slight inevitable reduction in the diameter of the two pinions would be more than compensated by the protection and lubrication provided, while a slight increase in the width of the teeth could easily be arranged. I think this plan preferable to my original suggestion of taking the drive off the counter-shaft gear box, both because it is instantly applicable to every type of machine, and because the gear box is usually quite large enough to be unsightly without any increase in bulk. The only thing is the trip recorder would go up with a bang when using the free engine.



A speedometer mounted on the top tube of a 3½ h.p. Rudge Multi, and driven from the rear wheel.

"Ailette" on Freak Gears.

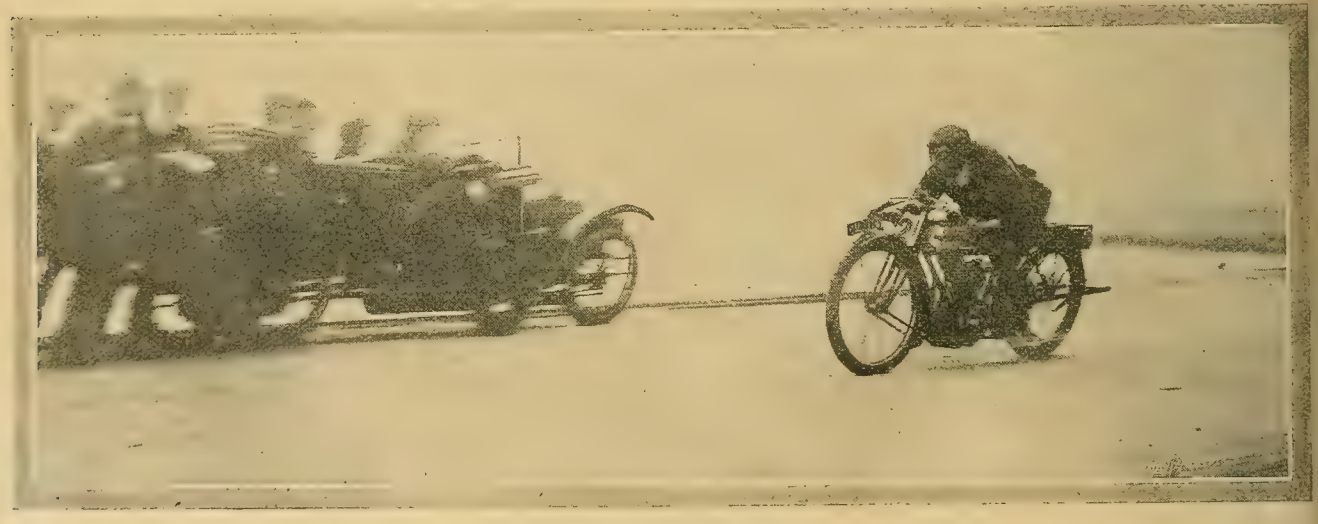
My colleague "Ailette" is inclined to differ from one or two members of the staff on the question of freak gears, and his interesting little note on p. 1210 of September 18th raises several very valuable points. He establishes the fact accepted by everybody except the trade that the lowest gear of any motor vehicle, be it bicycle, cycle car, or motor car, should be a true emergency gear, capable of enabling the engine to extricate the vehicle from any position, and of enabling the owner to visit any beauty spot in the country. So far, so good. The principle is thoroughly sound, and is applauded by every sensible owner, though there is only one motor car in the world, viz., the Stoewer, with a bottom ratio of 24 to 1, the makers of which can be said to have grasped the point at all completely. But this contention of "Ailette's" does not affect the Six Days or other controversial freak trials by a hair's weight. For all these trials manufacturers fit gears which they never dream of supplying to the general public. In such trials one may find 3½ h.p. three-speeders with special hubs giving an emergency ratio of 16 to 1: sidecar outfits with a bottom ratio of 18 to 1; two-speeders with ratios of 5 and 12 to 1: cycle cars with a low gear of 15, 16, and 17 to 1: and so forth. If we compare the standard models, the 3½ h.p. has an extreme gear of perhaps 13 to 1, at which the engine pulley is so small that the belt will not grip except on the level: the sidecar has an extreme of probably 11 to 1, the two-speeder is geared 5 and 8½: and the cycle car goes no lower than 12 at the outside. The mechanical contrivances by which these emergency gears are procured may range from special hubs, gear boxes, and sprockets to special axles. In most cases the makers possess but three or four samples, and though they will perhaps loan a sample to a favoured amateur for the purposes of an odd competition or two, they will very seldom sell them outright. The reason usually is that these special gears are mechanically unsound—some portion is so small that the wear is rapid, and prolonged satisfaction would be impossible, although the device may last a thousand miles in skilful hands.

Freak Hills cause Freak Gears.

I think my point should now be clear. If the "freak hill policy" had the effect of compelling makers to standardise a true emergency gear on all the machines they sell to the general public, we should consider very seriously whether this policy were not to be retained and applauded, no matter how much flukiness it imported into our fixtures. *But it has no such effect. It does less than nothing towards the standardisation of emergency gears.* On the contrary, it breeds temporary freak gears for competition purposes only, and it leaves the touring machine sold to the general public just exactly where it was, so far as emergency gear ratio is concerned. This is why I prefer my own terminology and the phrase "freak gear" to "Ailette's" phrase "emergency gear." None the less, I am heartily at one with him in urging that every variably geared motor bicycle and cycle car should possess a true emergency gear.

Weights in the A.C.U. Trials.

I can never read a trials weight list without fiendish chuckles. This year is no exception. In the 350 c.c. class I note that seventeen out of eighteen machines exceeded 200 lbs., and that seven of these "medium-weight tourists" scaled 2 cwt. or over. In the 3½ h.p. class the average weight, all on, ready for the road, is considerably nearer 300 lbs. than 200 lbs. 300 lbs. comes near being the minimum for a 750 c.c. machine, and if you fancy the comfort provided by 3in. tyres and rear springing, together with an engine capable of propelling so luxurious a specification, you must go to 3 cwts. Personally, I should have very little objection to these ultra-heavy machines were it not for the strain and labour implied in lifting them up on to their stands. I only know one stand which is really suitable for such leviathans, and I am not sure that it is still made: it consisted of two loose crutch legs, hinged to the rear forks, and had the merit of propping up the machine if one leg was dropped, without the unfortunate owner being forced to heft the whole three hundredweight into the air whenever he wished the machine to support itself.



A CURIOUS SNAPSHOT EFFECT.

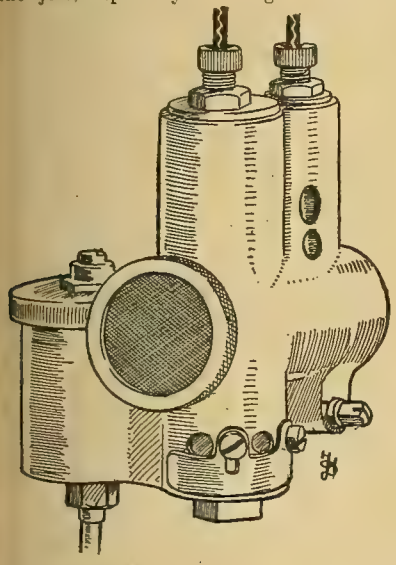
The photograph shows S. Crawley (Triumph) crossing the finishing line at the Brighton Speed Trials at over a mile a minute. As will be seen a slight movement of the camera has had the effect of showing the speed-man almost stationary, while the car and spectators by the roadside seem to be in full flight.

A NEW BINKS CARBURETTER.

Tested to give over 150 m.p.g. at 20 m.p.h. with a 500 c.c. Engine.

FROM his long experience of carburation, Mr. Charles Binks has evolved a very simple and effective automatic carburetter, which gives a truly wonderful petrol consumption without sacrificing either acceleration or power produced. We make this statement after a close study of the device and also a conclusive road test.

The principle on which Mr. Binks has been working is that a large proportion of the petrol in a daily run is lost by being shaken out of the jet by road vibration, and serves no useful purpose in propelling the machine. He arrived at this conclusion after protracted road trials with a glass-sided carburetter, by which means it became plainly visible that, whatever the petrol level, much unnecessary petrol was squirted out of the jets, especially on rough roads. It

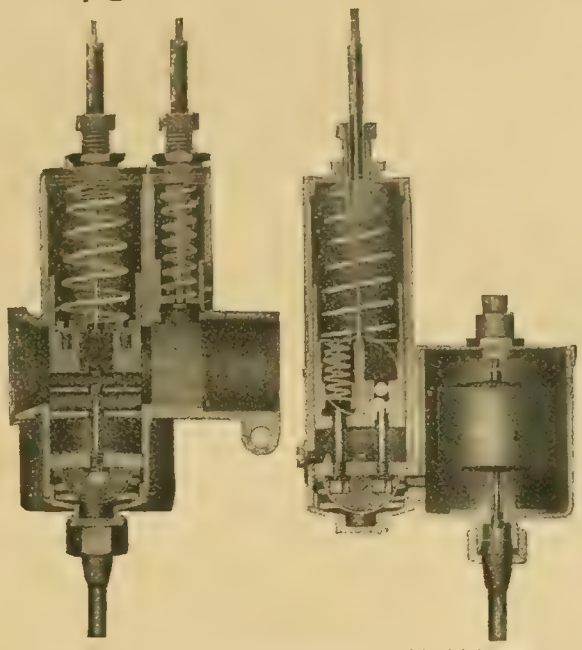


The Binks carburetter. The main air adjustment by means of a spring clip is visible.

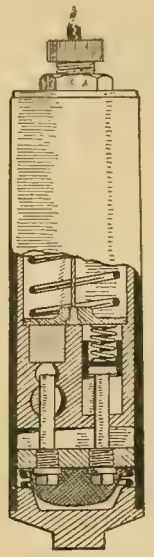
is obvious, then, that to save this wastage the jet or jets must be entirely shut off when not in action, such as when running downhill with the throttle shut or when running on the pilot jet.

A Pilot Jet Adopted.

In the new design two jets are retained, one being a small pilot jet for slow running and the second being a larger jet, which comes into action at speeds exceeding about 20 m.p.h. By a clever arrangement of varying choke tubes, a very progressive action is obtained, and if the throttle is gradually opened it is hardly possible to tell when the second jet comes into action. When the throttle is shut, both jets are sealed by pads of "bull neck," a species of leather, but as soon as the barrel is slightly raised the pilot jet is uncovered, and is surrounded by a small choke tube formed by a hole in the side of the solid barrel. On further opening the throttle a larger hole is opened up, and the extra air thus admitted is compensated for by the increased suction caused by the higher engine speed. Up till the time when the barrel itself begins to uncover the inlet port proper, the main jet remains sealed by its pad. This is brought about by the main jet pad being in the form of a brass covered piston mounted in a guide and held down on the jet by a spring. (This may be clearly seen in the part sectional sketch shown herewith.) As soon, however, as the main port begins to open, the small piston reaches the end of its guide, and is therefore raised with the barrel, thus uncovering the main jet, further throttle opening admitting more air in proportion.



Sectional views of the new Binks carburetter. The jet dampers are clearly shown.

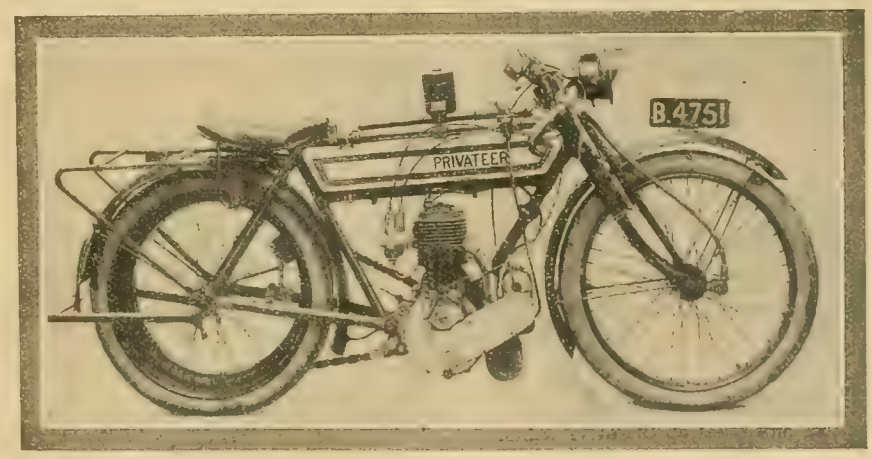


Section through throttle barrel of Binks two-jet carburetter showing main jet shut off.

Cold Air Inlet.

On the engine side of the carburetter is mounted a hand controlled air valve. It must be understood that the carburetter is automatic in action, and that this air valve is used as a correcter for atmospheric conditions or to allow cold air to pass into the engine when running down hill with the throttle shut. The valve itself shows evidence of the careful design which characterises the carburetter, for Mr. Binks, realising that a piston valve will not remain airtight after prolonged use, uses the sides of the valve for uncovering the extra air ports only, and prevents air leaks when the valve is shut by a coned face at the bottom of the piston.

Both jets are easily accessible by removing a cap below the jet chamber, inside which is a large filter to prevent any grit which may pass the float chamber reaching the jets. The float chamber is of the usual type, the needle being of the pull up type with the valve working in a



The motor cycle used for carrying out the tests of the Binks carburetter referred to on this page.

A New Binks Carburetter.—

detachable, and, consequently, easily renewable, seating. A neat snap-on lid is used.

Results of our Road Tests.

After a thorough examination, we undertook a road test, and, on reaching open country, carefully measured exactly one gill into a special test tank, and started on a consumption trial. The machine was driven at an average speed of 20 m.p.h. over the main London-Coventry Road, and accomplished exactly 9.9 miles on the gill, giving a consumption of 157.4 m.p.g.—a very creditable performance. The machine was fitted with a Fafnir 85 × 88 mm. single-cylinder engine, with a fixed gear of just below 4⅝ to 1, and, except for dropped handle-bars, was in full touring condition, with wide mudguards, lamp, horn, speed indicator, carrier, etc. We rode the machine home at varying speeds to prove that the jets were not too small for touring purposes, and found that, though the machine would fire evenly at a fast walking pace, it would accelerate smoothly to approximately 50 m.p.h. Mr. Binks assured us that, with racing jets, the machine would do well over 140 m.p.g. at the same average speed, and was prepared to prove his statement by a further test, but on this occasion we had no further time at our disposal.

ZENITH 1914 MODELS.

A Counter-shaft Gradua Gear Affording Wider Ratios.

Messrs. Zenith Motors, Ltd., intend to market three distinct types for next season, all of which will be twin-cylinder machines—the 3½ h.p. 70 × 64½, the 6 h.p. and the 8 h.p.

The chief innovation consists of a new counter-shaft drive. The power is transmitted from the engine to the counter-shaft by means of a chain, and entirely enclosed and running in oil is a large cone clutch, operated by a pedal. On the same shaft on which the larger chain wheel is carried, the pulley, which is 7in. in diameter, is also fitted, while on the opposite side is a kick starter, consisting of a chain and free wheel, which are entirely enclosed. The whole mechanism is swung on a pivot at the top, and attached at the bottom to a slotted bracket so that the driving chain may be easily adjusted. Gear ratios ranging from 4 to 1 to 11 to 1 may be obtained.

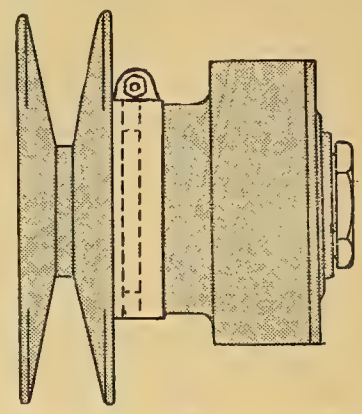
The same frame is used for all models, while each model will be sub-divided into two types, one without the counter-shaft drive and the other fitted with it.

A Remarkably Smooth Clutch.

All Zenith specialities, such as the Gradua gear, and the quickly detachable back wheel will be retained. Mr. Barnes demonstrated the efficacy of the new clutch to us in the course of a short drive round Weybridge, and on several gradients, varying from 1 in 20, to 1 in 9, he stopped and restarted the sidecar combination without the slightest falter, and on several occasions turned right round on the middle of the hill and restarted. The clutch is delightfully smooth in action, and takes up the drive without the slightest shock.

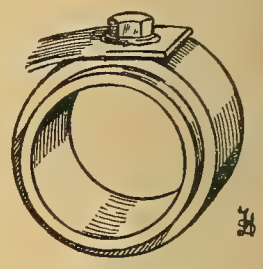
TIPS FOR USERS OF PHILIPSON PULLEYS.

One of the only troubles which is likely to befall users of the wonderfully simple Philipson governor pulley is the breakage of the spring controlling the action of the governor. Though an unusual occurrence, one or two have snapped at the point at which the inner end is affixed to the central collar, but the cure is quite simple. The collar as sent out on Philipson pulleys up to date is quite circular, but if a flat about ½in. wide is filed on the collar so that the end of the spring is anchored to a flat surface, no trouble should be experienced in this direction. This tip should be more valuable to users of racing governors than the touring type, as the former have stronger springs.



Suggested clip for Philipson governor pulleys to exclude dirt.

Now that winter is approaching and muddy roads will soon be the order, a simple device to exclude mud and dirt is advisable to bridge the space between the rubber buffer and the governor. Users will have noticed that mud mostly collects at this point, and as the all important screw for the floating flange is adjoining, the necessity for the exclusion of foreign matter is apparent. Oil, too, has a habit of collecting grit, and soon the thread would be worn. The suggestion is to fit a band of strip tin over the rubber buffer, wide enough to enable one side to project sufficiently to bridge the recess. A clip similar to those used for water joints of car engines is admirable and will be found to keep the interior of the pulley quite clean.



To prevent the spring breaking where it is anchored, file a flat on the collar as shown.

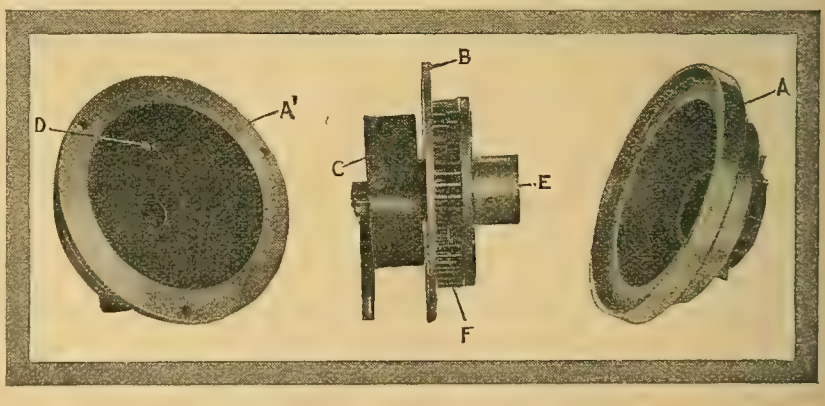
THE "KILSHOCK" TRANSMISSION GEAR.

This is a device made by Messrs. Oppermann and Company, 13, Albemarle Street, Clerkenwell Road, E.C., which is designed to render chain transmission smooth and at the same time to obviate loss of power through any slip.

The accompanying illustration shows the device taken to pieces, and it will be noticed that it consists of an outer shell A A¹ carrying the engine sprocket, a plate B attached to which is a boss carrying a groove, into which the end of the coil spring C shown in the photograph is fitted. The other end of the coil spring is attached to a spindle, which engages with the hole D in the shell A¹. The two outer shells are fastened by screws on to the central plate. The inner sleeve E, which runs through the sprocket shaft, is keyed on to the engine.

The only connections, therefore, between the sprocket and the engine are through the spring and the differential gearing F, shown in the illustration. The object of the spring, of course, is to take up the shock, and of the differential gear to give up the drive the moment the shock is relaxed.

The device has been well tested, and has been proved to be satisfactory. It is made of the best quality steel throughout, and is intended for use on motor cycles and cycle cars which depend on chain drive for propulsion.



The "Kilshock" device for fitting to chain transmission.

Question & Reply

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

South Wales to North Devon.

I am intending motor cycling to Combe Martin, North Devon, and should be obliged if you could let me know the best route from Monmouth, trying to avoid towns such as Bristol, also the Porlock and Lynmouth to Lynton hills. My mount would be a single-geared clutch Triumph, and I should like to do the journey in a day. What should you estimate the mileage to be?—F.W.P.

Your best route would be as follows: Monmouth, Gloucester, Stroud, Nailsworth, Dunkirk, Doddington Ash, leaving Bath on the right, and continue to Radstock, Wells, Glastonbury, Bridgwater, Taunton, Milverton, Bampton, South Molton, Barnstaple, to Combe Martin. The distance is about 150 miles.

Welding a Cracked Cylinder.

My 3½ h.p. engine has lost power lately, and I have discovered a small crack on the exhaust valve seating. Is this serious? Is it likely to become worse? Is a new cylinder necessary, and, if so, shall I have to have a new piston, too, to ensure a proper fit? My friends tell me that the welding process is not satisfactory.—J.S.H.

Your best plan will be to get an expert welder's opinion on the crack. Sometimes these cracks increase, and then, of course, the engine loses compression. Sometimes they can be repaired, and this again is a matter for the expert welder to decide. Generally speaking, it is possible to have satisfactory repairs of this description carried out by welding, but it is not a cheap process, and must be done properly.

Running on Benzole.

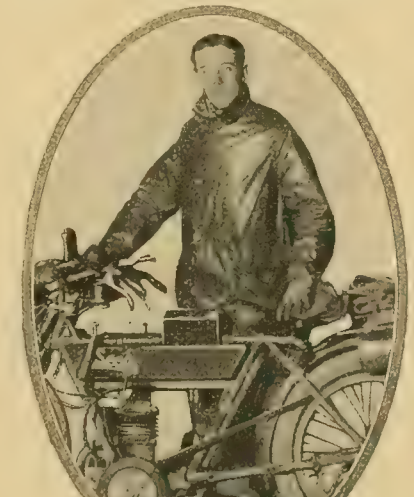
I have a 1913 three-speed Triumph and sidecar, with which I leave for a holiday in a day or two. I had intended trying benzole, but have just been informed that there is danger of burning and damaging the valve pockets and interior of the engine. I cannot afford to run any risk of damaging my engine, with which I am quite satisfied, only I find the cheapness of benzole hard to resist. Please advise as to the correctness of what I have been told.—S.J.M.

In using benzole there is no danger whatever of burning or damaging the valve pockets and interior of the engine. Sometimes the valves are covered with a fine deposit, but it does not affect the running of the engine, and is purely on the surface. Provided your carburetter will take benzole it is quite to be recommended, but possibly you will have to make slight adjustments to give a larger air supply.

Tyres for High-powered Sidecar.

The tyres on my 6 h.p. motor cycle and sidecar have worn smooth, although I have only run them 2,000 miles; also I am having punctures in sidecar and front tyres. Should these have worn down so quickly? Would it be advisable to fit a Lomax non-skid band on rear wheel? Are these quite satisfactory and also easy to put on and take off? Would it be better to have tyres retreaded or buy new ones, as I have noticed some of your correspondents have had very poor results from retreaded covers?—CEDAX.

If the sidecar is properly aligned the tyre should not wear down so quickly. You might try fitting a non-skid band on the driving wheel tyre. This, we understand, is satisfactory and easy to attach. Some tyres stand retreading very well; others will not. Retreading is sometimes rather a lottery. Your best plan, we think, would be to fit voiturette tyres for the sidecar combination.



A. Milner (2¾ h.p. Levis) who successfully completed the Birmingham to Carlisle and back 24 hour run, climbing all hills (including Shap Fell) with a single gear.

Two Types of Twin Engines.

I should be much obliged if you could let me know the advantages of the 90 mm. × 77½ mm. twin J.A.P. engine, with side-by-side valves, as compared to the 85 mm. × 85 mm. twin engine of the same make, also with side-by-side valves. How do they compare in the following points: (1.) Slow running when free. (2.) Petrol consumption. (3.) Carbonisation of cylinder and piston heads. (4.) Maximum speed. The machine would be used with sidecar, passenger, and luggage.—N.E.A.

The 90 mm. × 77.5 mm. engine is of considerably later design than the 85 mm. × 85 mm. twin. It runs more quietly, and is more controllable and smoother running. The petrol consumption would, we imagine, be about the same, and there would be no difference as regards carbonisation. The maximum speed would be about sixty-five miles an hour solo, and about fifty or fifty-five with sidecar, under favourable conditions.

Carburetter Needs Adjustment.

Will you kindly explain the following point? My new twin-cylinder 5-6 h.p. J.A.P. ran splendidly for 1,000 miles, the ignition at that time being fully retarded. Something fouled the point of the carburetter needle, and I had a new one fitted. Since then it drives with full air as before, but I must advance ignition fully to obtain a speed of 30 m.p.h. The plugs soot up about every 100 miles. Once, on being started, it caught fire. I never need lessen the air supply, and if I remove the gauze from the air intake the machine runs very badly. I can, of course, open the air slide wider than the throttle, but with the gauze off the engine backfires badly.—T.

When the new needle valve was fitted probably the petrol level in the carburetter was upset, and we should advise you to test this. The fact that the plugs soot up is probably due to too much oil in the crank case rather than the carburetter adjustment. Machines are apt to catch fire if the magneto timing wheel has slipped. Perhaps this is the case with your machine. With the spark advance lever half retarded, the points of the contact breaker should have just begun to break, when the piston is at the top of the compression stroke. See that your carburetter (jet, air inlets, etc.) is clean and free from air leaks, which cause bad starting, loss of power on hills and spoil an otherwise slow running machine.

A Two Days Sidecar Run.

Would you kindly tell me the best route to take from Darlington (Co. Durham) to Blaenavon (Mon.) with sidecar combination?—W.R.

Your best route would be as follows: Darlington, Northallerton, Boroughbridge, Wetherby, Aberford, Ferrybridge, Doncaster, Worksop, Mansfield, Nottingham, Loughborough, Leicester, Coventry, Kenilworth, Warwick, Stratford-on-Avon, Evesham, Tewkesbury, Gloucester, Ross, Monmouth, Abergavenny, to Blaenavon. This should take you two days.

A Question of Licence.

I recently bought a motor cycle at an auction sale. It is a 1½ h.p. Werner, which I have just had put into running order. Would you kindly tell me how to register it and what licence I shall require? I want to run it with a carrier for delivering goods. Can I put my name on the tank and ride it with only a driver's licence?—W.L.

Any policeman will tell you the local licensing authority. You have to apply to them (or to any other registration authority you like) for a registration number, fill up a form, and pay a fee of 5s. You cannot be exempted from the local taxation licence unless the machine is constructed to carry goods or merchandise, and is solely and entirely used for this purpose, and never on any occasion used for your own pleasure.

Advice to a Beginner.

I notice that you are willing to help with information and advice intending motor cyclists among your readers. I have been reading "Motor Cycles and How to Manage Them," and it gives a general impression that for a beginner a single-cylinder, medium power machine is desirable. My motor cycling friends, however, do not seem to think this so. I hope before long to take up motor cycling, and I would like to get a twin-cylinder machine about 7 h.p. I should want later to fit a sidecar, and would like to be able to maintain a good speed in very hilly country. I would be prepared to take considerable trouble, and to go thoroughly into everything from the start, and, of course, to take all possible care. This being so—(1.) Could not a beginner with average commonsense start with a higher power, twin-cylinder machine? (2.) Do you consider it very important that a beginner should learn on an older machine before buying a new one?—C.C.S.

(1.) We still maintain that a low-powered machine is best for a beginner, but for a man of intelligence, who can quickly master his machine, high powers do not present much difficulty. The great thing to do is to become thoroughly accustomed to the machine before running it fast, but the average beginner nearly always starts motor cycling with the idea that the machine will get out of hand and he will not be able to stop it. (2.) Naturally we give this advice so that a beginner would have less chance of spoiling things in the case of an old machine than with a new one.

The Midlands to North Wales.

Please let me know the best route, with approximate distance, from Nuneaton to Llanfairfechan (North Wales).—C.A.B.

Your best route would be as follows: Nuneaton, Atherstone, straight along Watling Street, the Holyhead Road (which is signposted by the Royal Automobile Club), *viâ* Shrewsbury, Llangollen, and Corwen, as far as Bettws-y-Coed, where branch off for Llanrwst and Conway, seven miles after which you reach Llanfairfechan. The distance would be approximately 140 miles.

Carbon in Base Chamber.

(1.) The back wheel of my tricar has $\frac{3}{16}$in. spokes, which break at the hub of the wheel or an inch above it where the spokes cross. I have tried the makers, spoke manufacturers and wheel makers and cannot get $\frac{3}{16}$in. spokes; the size seems unusual. (2.) I have taken down my twin-cylinder engine, and find two black marks on the third piston ring in the front cylinder and the same on the second ring of the back cylinder. There was also a lot of carbon on the piston heads and also black carbon deposit all over the inside of the crank case. The engine has been running and firing perfectly. What is the cause of the extra deposit and dirty crank case? The rings are tight, and the slits were not in line.—J.O.

(1.) We think you must be labouring under a misapprehension with regard to the size of the spokes. $\frac{3}{16}$in. are entirely out of the question and are never used. They are far too large, and therefore it is only natural that you have difficulty in procuring them. The usual size is 12 gauge, or 10 gauge for extra heavy ones. Any garage or motor cycle agent would be able to supply you with these. (2.) With regard to the trouble with your piston rings, it is very obvious that gas is leaking past the rings, which would account for the black marks and also for the presence of carbon in the base chamber, though it is very unusual for this to be found there; of course, the mere fact of burnt oil blowing past the rings is bound to keep the base chamber in a dirty condition. The remedy is to fit new piston rings and thoroughly clean the under side of the piston, and also be sure, when fitting the new rings, that the carbon is completely cleaned out of the ring-slots.

Shrewsbury to Bradford.

Will you kindly let me know the shortest and best route between the above towns, missing all towns possible, particularly Manchester; also the distance?—A.C.P.

Personally, we should advise the following route: Shrewsbury, Wem, Whitchurch, Tarporley, Warrington, Wigan, Preston, Whalley, Clitheroe, Gisburn, Skipton, Ilkley, and Bradford. This is not the most direct, but it is certainly the road on which you will meet the least traffic. The distance is approximately 141 miles.

Starting Difficulty.

My new mount, a 6 h.p. twin, is very difficult to start when cold, and the other day I had rather a fright, for on trying to start (handle gear counter-shaft) the charge blew back through the carburetter and it burst into flame. To what do you attribute this, and is it a rare occurrence? Can you give me any help regarding difficulty of starting?—C.B.M.

Difficult starting is nearly always due to too much air at slow speeds, caused either by mal-adjustment of the carburetter, or air leaks in the carburetter or inlet pipe unions. The backfire might have been due to the inlet valve sticking and not closing properly. See that the stems of the valves are free in their guides. They may require a little rubbing with emery cloth. Smear a little graphite on the stems before replacing the valves.

EXPERIENCES WANTED.

"G.G.G.F." (Parkstone).—Humber, 1911, 3½ h.p. two-speed, with sidecar. General reliability, hill-climbing, and average consumption.

"W.R.B." (Cardiff).—2½ h.p. single-gear Wolf, also Auto-wheel.

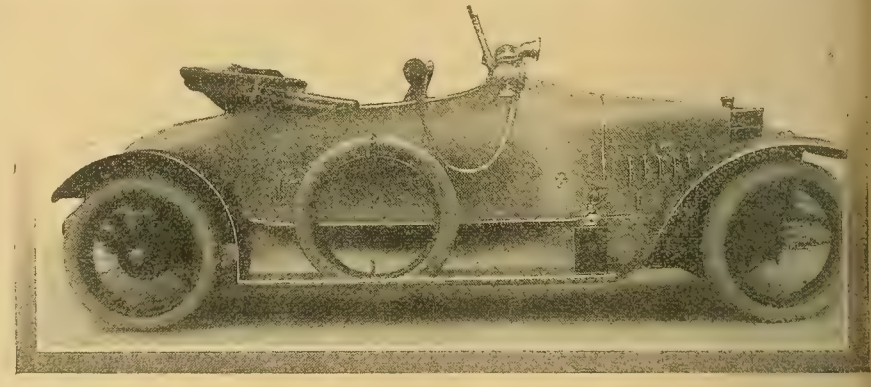
"C.W." (Norwood).—General experience of the Auto-wheel.

"G.H." (Ripon).—Most suitable belt for Brampton gear.

"D.J.R." (Paddington).—3 h.p. Enfield. Efficiency of lubrication system, speed, maintenance of power, and general efficiency.

"G.W.S." (Brandon).—1912 2½ h.p. Torpedo-Precision.

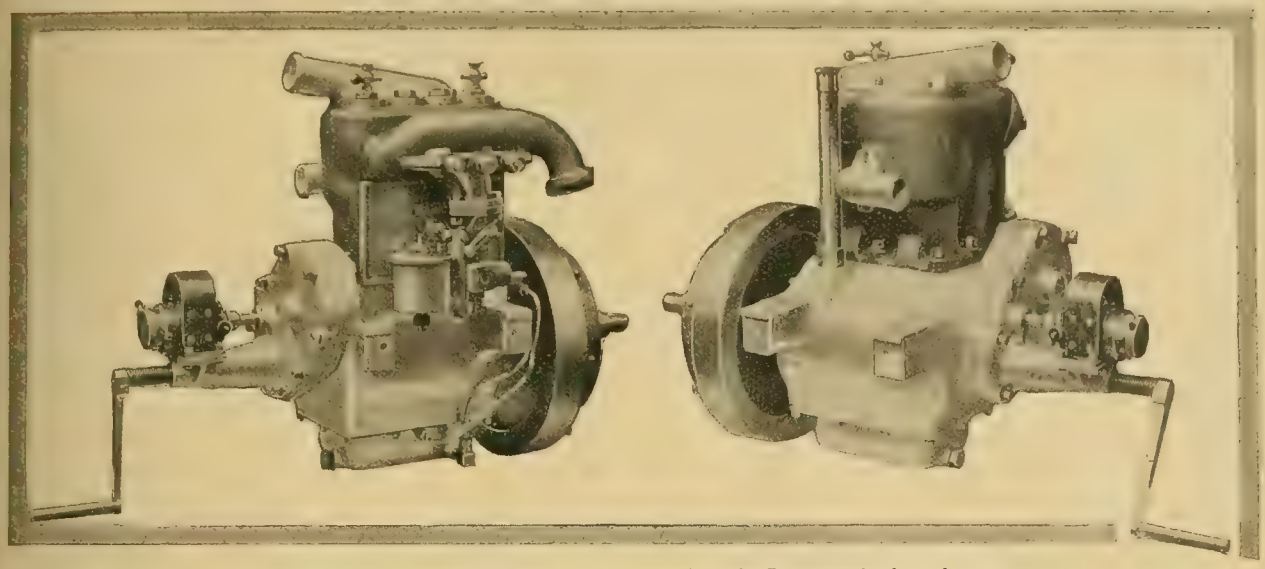
"D.H." (Sidcup).—Benzole with 3½ h.p. Triumph (1910 preferred). Consumption, speed, and hill-climbing.



The above smart looking Wilton cycle car, which has an attractive body finished in blue, was noticed recently at Brooklands.

The Dorman Two-cylinder Engine.

Single Piece Cylinder Casting. 9 b.h.p. at 1,500 r.p.m.



Both sides of the twin-cylinder (80 mm. × 108 mm.) water-cooled Dorman engine for cycle cars.

IT will undoubtedly come as news to many readers that the firm of W. H. Dorman and Co., Ltd., Stafford, have engaged in the manufacture of internal combustion engines for upwards of twelve years, and designed and constructed during this period engines to the order of several different firms who market motor vehicles for both pleasure and business purposes. Recognising the demand that there is for a motor for use on small cars and cycle cars they have decided to manufacture and sell under their own name the twin-cylinder water-cooled engine, which we illustrate. We recently had an opportunity of examining several of these engines in process of manufacture and test, and have no hesitation in saying that any firm deciding to adopt this engine will be thoroughly satisfied with Messrs. Dorman's products.

The works are large and comprehensive, and in addition to manufacturing petrol engines the firm construct a large number of light machine tools used by motor manufacturers. They are, therefore, particularly well equipped for the production of their own engine.

Features of the Dorman Engine.

The accompanying illustrations show both sides of the twin vertical engine, which has a bore and stroke of 80 × 108 mm. = 1,098 c.c. The two cylinders are cast together, and offset from the crankshaft, the water jackets being of generous proportions, which enable the engine to keep particularly cool. The firm have their own foundry, and are, therefore, well equipped for turning out clean cylinder castings exactly to their own ideas, and of a uniform construction. The pistons are specially constructed with a view to good compression; at the same time provision for the oil distribution over the cylinder walls has been well carried out. The rings are duplex, *i.e.*, there is a deep groove in the top of the piston into which is sprung a very wide eccentric piston ring. Over this are placed two other rings of exactly half its width. The latter are not eccentric. Their purpose is to make a perfect compression joint, the inside rings supplying the spring. There is no bottom ring, but a sleeve is provided to prevent piston rock, and between this sleeve and the rings is a recess with a sharp edge which acts as a scraper, and always carries a body of oil in it to lubricate the cylinder walls. If the crank case be filled up with oil we are assured that the engine will not smoke, neither will the oil exude. The gudgeon pin is held by a set screw provided with a certain taper which keeps it firmly in position and yet enables it to be readily removed when required.

A Tappet Guide Refinement.

The valves are interchangeable, and equal in diameter to half that of the cylinder bore. The tappets are adjustable, and a little refinement in the tappet guides enables oil to travel up one side of the guide, fill the well at the top, and return to the crank case down the other side. The tappets therefore work in an oil bath and no oil overflows from the well. The valve guides with their springs are enclosed with an aluminium cover, and are readily accessible. The camshaft is profiled from a solid bar, and is driven by gear wheels running in an oil bath, and being all very substantially designed and accurately cut they run without undue noise. The crankshaft is of particularly robust proportion, made of high tensile steel and ground to exact sizes on the journals and pins. It is essential on any twin-cylinder vertical engine for the crankshaft to be very strong, and the crankshaft of the Dorman engine is practically unbreakable. The connecting rods are carefully balanced, fitted with bronze small end bearings and anti-friction big end bearings. The lubrication is automatic by mechanical pump. Oil is supplied to two separate troughs underneath each connecting rod, the latter being fitted with scoops to the big ends. The oil sump below the crank chamber holds three pints of oil, which will run the engine for a very considerable distance without replenishment.

The Eisemann high-tension magneto is carried on an extension of the crankshaft bearing, and is driven by

The Dorman Two-cylinder Engine.—

an adjustable universal coupling. Another model can be supplied with an alternative position for the magneto if desired, but the standard position renders the magneto most accessible where space between engine and radiator permits it to occupy the place in which we illustrate it.

Brake Horse-power Developed.

The Dorman engine develops 9 b.h.p. at 1,500 r.p.m., and will run up to 2,500 r.p.m. when the engine is capable of delivering 14 h.p. Of course, like all two-cylinder vertical engines it has a "critical" period, but the engine has been so balanced and designed that this period is found at about 700 r.p.m., at which speed the vehicle would be travelling nine miles per hour on the top gear—a speed which is seldom found necessary with the top ratio in use. At speeds above and below 700 r.p.m. we found the engine to be quite free from vibration, and when throttled down we think it would be almost impossible to detect by touch that the engine was a two-cylinder and not a four-cylinder. The Sthenos carburetter is employed, this being fitted on the near side of the engine.

Messrs. Dorman have already secured some large contracts with this engine, and among other small cars and cycle cars to which it will be fitted for 1914 we may mention that the makers of the G.W.K. intend to have 500 of their friction-driven cycle cars fitted with this engine. Another large firm will also market a complete set for cycle car construction consisting of the Dorman engine with crank case extension to take the gear box, universal joint, and back axle. The price of the engine complete with magneto and carburetter, but without the flywheel, is £50. Flywheel and clutch, and if desired, a water pump fitted on the engine, can be supplied at an extra cost. The approximate weight of the engine complete without the flywheel is 100 lbs., and the over-all dimensions, from the magneto contact maker to the flywheel disc, are 22¼in., height from the drain plug to the centre of the water outlet 27in.

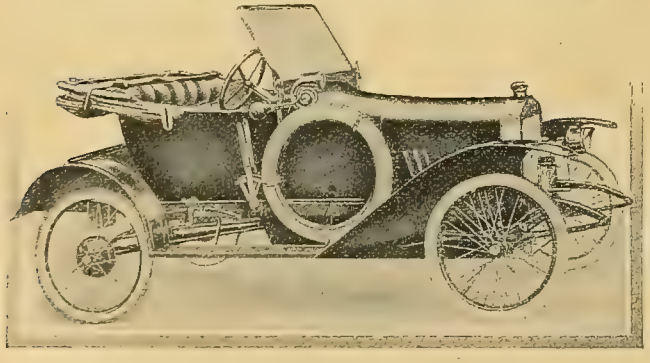
SWIFT IMPROVEMENTS FOR 1914.

AN inspection of the latest model Swift cycle car at present undergoing tests convinced us that there will be a large demand for this vehicle during 1914, and the firm are making extensive preparations to cater for it. The alterations for 1914 are not sweeping, but the appearance of the machine has been changed for the better. The twin-cylinder vertical engine has been very little changed, the only alterations consisting of a slight widening at the base to enable the engine to be fitted to a larger and wider pressed steel frame, which will take the place of the tubular frame, and the provision of exhaust pressure-feed lubrication.

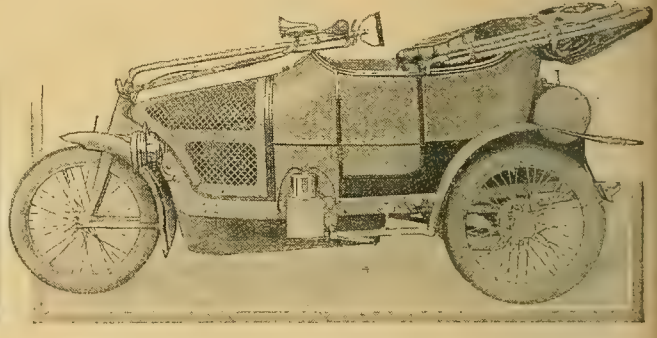
Instead of cheapening their production in this direction the Swift Co. have designed it on the lines of their larger vehicles. That is to say, the gear box, worm steering, back axle, and other component parts have been designed on the lines of the 12 h.p. car, but, of course, lighter and smaller. To all intents and purposes the new Swift is not a cycle car but a miniature car. The frame is upswept behind and inswept in front, the front axle is of H-section, whilst it has worm and worm-wheel steering, three-speed and reverse gear box, and cardan-shaft with double universal joint. The gear box has been brought in line with the gate change quadrant, and particular attention has been paid to the springing. The wheels and tyres have been increased in section from 650 × 65 to 700 × 80 mm., and all wheels run on ball bearings. The body is 3in. wider than formerly, and modernised by a tapered bonnet. This naturally has greatly improved its appearance. The wheelbase is 7ft. 3in., the wheel track 3ft. 7in.

Running boards have now been fitted. £140 is the price fixed upon, which is only a £3 increase on last year. This figure includes hood and screen, two acetylene lamps, and oil tail lamp, also horn.

The Swift Co. expect to be in a position to give delivery immediately following the Show. A large section of the Cheylesmore factory is being devoted to the construction of these machines, and when we paid our tour of inspection we saw rows of pressed steel frames and large quantities of rough and finished parts in the stores and in course of construction in the works.

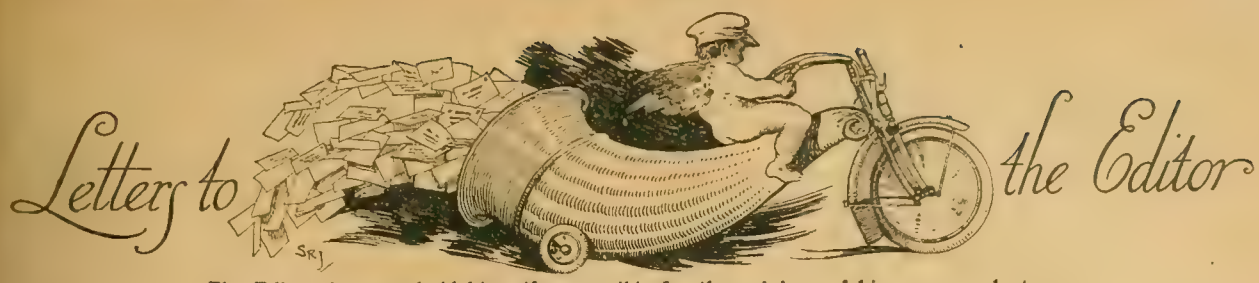


The Premier, a four-cylinder cycle car of Bavarian origin.



The Walter three-wheeler which is on similar lines to the Wall tri-carriage.

QUITE a number of light four-wheelers and a few three-wheelers are being turned out in Austria, but the demand there, writes our Vienna correspondent, is almost exclusively for the cycle car built on car lines—the large car in miniature, in effect. The appallingly rough road surfaces encountered outside the towns makes a three-wheeler awkward to handle, thus such types are usually only found in towns.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

The Price of Motor Cycles.

Sir,—As one of the large number of would-be motor cyclists, I must congratulate Messrs. Humber, Ltd., on their initiative in reducing the price of their motor cycles in 1914 by £5. This is a very welcome move in the right direction, as in recent years, with variable gears and other refinements, the price has usually tended to increase. With the greatly increased production during the last two or three years, it is time that such a reduction should become more general, especially as the motor cycle is now out of the experimental stage.

I may add, though not yet a motor cyclist, I derive great pleasure from the perusal of your journal, and wish it every success. MANCUNIAN.

Level Crossings.

Sir,—May I use your columns to call the attention of the public to the disgraceful way in which traffic is hindered and delayed by level crossings on the main roads?

A few days ago I was travelling on the main road from Northampton to London. Arriving at a level crossing we found the gates shut. After eight minutes a slow passenger train went through, but the gates still remained shut. Again we waited, this time for seven minutes; then a small goods engine passed. Now, at last, the signalman came down from his box and opened the gates after a delay of something over fifteen minutes.

Surely all this delay is unnecessary. At least the gates might have been opened between the passing of the train and the goods engine, and I find it difficult to believe that it need be necessary to shut the gates eight minutes before the arrival of a train.

This is not the only occasion on which I have been kept needlessly waiting. I have frequently been delayed from five to ten minutes, and even more, at other level crossings, and I should like to hear the opinions of others on this matter. G. BILLINGSLEY WILLIAMS.

Benzole.

Sir,—I should like to give you my experiences with benzole. I ride a 2½ h.p. Brown-Precision, which averaged about 110 m.p.g. I was then persuaded to try benzole, so I emptied my tank (which holds exactly seven pints) and put exactly six pints of benzole into the tank. I then went from Mildenhall to Cambridge and back, at an average of 25 m.p.h., and again measured the benzole of which there were four pints left. This resulted in 44 miles to one-quarter of a gallon of benzole = 176 m.p.g. I find my little engine picks up better, and think there is a decided improvement all round. A. D. PRYOR.

Sir,—When on a visit to Manchester recently with a 1913 three-speed Triumph and sidecar I obtained two gallons of benzole from the Birchenwood Colliery Co., Ltd., Kidsgrove, and tried it with the jet I was using, viz., 38, and also a 32, but preferred the former. I was greatly surprised at the increase of power over petrol, and although I rode with full extra air and magneto fully advanced, engine would not knock even when picking up on hills with 4½ to 1 gear, and my passenger was over eleven stone. I averaged ninety miles to the gallon, whereas with petrol I do about sixty. Upon the return journey I had to fill up with petrol at Rugeley, and between there and Lichfield again had to resort to more second gear work, reduce the air supply and retard the magneto. The price I paid for the benzole was 1s. 3d. per gallon, and, provided it has no bad effect on the engine, I would much rather use it if it cost 6d. per gallon more than petrol instead of less.

W. H. BROAD.

Sir,—I have read with interest your readers' views respecting the above. I am desirous of your knowing my exact experience. Some four months ago I started to use benzole (95%) on my 3½ Humber with sidecar. At first I found that it was more powerful, and I increased my mileage to the gallon but with rather harsh running, and recently, thinking I had a broken piston ring, I took the cylinder off, and, to my surprise, found that I had a cracked piston and gudgeon pin. I may mention that I am absolutely confident it is not through any fault of the makers. PETROL.

[Our correspondent appears to think that the cracked piston is due to use of benzole. This is quite improbable.—ED.]

Clothing for Doctors.

Sir,—I should like to draw the attention of my motor cycling *confrères* to the spring leggings made by Brooks, the saddle people. I have found them extraordinarily convenient, their great virtue being that they can be taken off and on in a second or two without undoing strap, buttons, or any fastenings whatever. One of the great drawbacks of doctoring on a motor bicycle, to my mind, has been the bother and mess of getting out of one's overalls when going into people's houses. I have often got my hands so dirty in this process that I have had to ask for a wash before going up to see the patient. Then, in going away, one has to spend an awkward three minutes scrambling into muddy overalls again, under the eye of a supercilious footman. This is all done away with by the spring leggings. So simple and admirable are they in use that one is tempted to ask, "Why on earth did no one think of them before?"

H. GASKELL, M.B.

Touring in Scotland.

Sir,—I observe the question by "G.K.C." in your issue of September 11th, and would like to give the writer the benefit of my experience in the Highlands of Scotland while touring on my motor cycle. In the first place, I may mention motors are not allowed on the Trossachs Road, at least from Callander, and to cross Loch Lomond to go to Loch Katrine would be quite absurd. Rather take the brake tour from Callander to Trossachs one day when the rider feels tired. The change will be welcome. From Edinburgh I would advise the motor cyclist to proceed by Linlithgow, Stirling, and Balloch to Loch Lomond; along Loch Lomond to Ardlui, Crianlarich, Dalmally, Taynuilt, and Oban. Return by the same road to Crianlarich, and proceed to Killin, along the north shore of Loch Tay to Kenmore, thence on to Dunkeld or Pitlochry, and north to Blair Atholl, Dalwhinnie, then to the left for Loch Laggan and Fort William, along the Caledonian Canal to Inverness (I prefer the north side of Loch Ness for scenery). If time permits go north to Beauly, Dingwall, Strathpeffer, and right on to the west coast, and return to Inverness; thence south by Carr Bridge, or east by Elgin, Aberdeen, Balmoral, Braemar, Blairgowrie, Perth, Crieff, St. Fillans, Loch Earn, Loch Lubnaig, Callander (for Trossachs), Stirling, Biggar, Dumfries, Carlisle. This tour through Scotland would take nine days comfortably, but be sure and carry a spare cover and tube; they will probably be required.

I travelled most of these roads this summer with my wife, a tent, and a sidecar. S 40.

Consideration.

Sir,—As one of the officials responsible for the organisation of the East Meon hill-climb, I cannot let the letter in your issue of 11th September, entitled "Consideration," go unchallenged. This event was run off between the Southampton and Portsmouth sections of the Hampshire Motor Cycle Union, and I consider your correspondent's strictures as to the conduct of the competitors to be greatly exaggerated. I have no means of knowing what the conduct may have been of unattached motor cyclists who were present as spectators only, as I was occupied at the hill, which is nearly two miles from the village, for from about 2.30 until after 6 o'clock, as were also all the competitors, so they had no opportunity of "careering through the High Street" between the times mentioned, as they were fully occupied with the weighing and running off of the various classes, and did not enter the village until the event was finished, and then only to have their tea previous to dispersing. Judging by the keen interest in the riders displayed by the local people, I do not think there were any who would object to more frequent visits to their "sleepy hollow."

The latter part of your correspondent's letter does not display the best of taste. Surely, sir, a motor cyclist can don any headgear he chooses? I seem to have recollections of seeing many prominent riders mentioned as taking part in open trials and on Brooklands garbed distinctively, and even fantastically, but I have never heard them described as "jack-asses!" I would strongly advise "AA 1160" to join up with the nearest club to him (the Portsmouth and District), when he will find that the "jack-asses" are a fine lot of fellows, and "good sports" to a man.

H. PERCY YOUNG,
Hon. Sec. Southampton and District Motor Club.

Sir,—The four members of the Portsmouth and District M.C., who reply to my letter, scarcely justify themselves by impugning my sportsmanship. I am sufficiently a sportsman, I hope, to remember that there are other people who use the roads besides one's own self; and that, apparently, is what they do *not* remember. They make no reply whatever to my charge of riding at an unsafe pace through a narrow village street. Was that sportsmanlike? They say that if I had been a true adherent to the cause I should have been too busy rejoicing in the sound of a healthy exhaust to abuse their ideas of enjoyment. What cause? I certainly cannot see how the riding of machines through a village with exhaust open advances the cause of motor cycling. And, finally, they defend their extraordinary headgear on the ground of picturesqueness. Why not go the whole hog, and paint their overalls with stripes of purple and green, and their faces like a clown's at the circus. It would be just as sensible. It is worth noting that the report of the A.C.U. Six Days Trial rejoices over the practical elimination of outlandish costumes from the trial. Club secretaries, please note!

But the whole matter is of wider importance than merely the action of some participants in a club hill-climb. In the first place, motor cyclists who live in the country are well aware that there is still a vast amount of prejudice against motor cycles and their users. Is that prejudice likely to be lessened by actions such as those against which my complaint was directed. And, secondly, we not infrequently hear regrets that the vast majority of motor cyclists remain aloof from the local clubs. This is undoubtedly true, and one of the reasons, I am sure, is that many of us heartily dislike the "knutty" element in the clubs. AA 1160.

Colonial Requirements.

Sir,—I have noticed a good deal written about road clearance on colonial models. Now I ride a 3½ h.p. Abingdon fitted with the Armstrong three-speed gear, and I find that with only four inches road clearance, I very often strike a rough bump with the bottom of the crank case. I am very much in favour of, say, six inches road clearance on colonial models. English firms can hardly be expected to know the vile roads their machines have to be ridden over in the country out here. Large tanks to hold not less than two gallons are necessary, as fuel cannot always be obtained in every township. Sufficient mudguarding is often neglected, especially on the back wheel, which should be well guarded.

Cut-away frames are exceedingly comfortable to ride over rough ground, as one can very often avoid a spill, by using one's legs from a low riding position.

Variable gears are, I find, absolutely necessary over rough and hilly country. I use and recommend the Armstrong three-speed gear, which has not given me one moment's trouble in nine months' use.

Footrests seem to be out of place on most models, being placed too far ahead, whereas if placed almost under one's saddle a far better balance can be obtained over bad roads.

In closing, just let me wish *The Motor Cycle* every success, and that these few hints will not be altogether discarded as coming from one who knows. LOUIS H. LEE.

Failford, N.S.W.

Sir,—I send you herewith a photograph which I thought would be of interest.

The machine is a 2½ h.p. Motosacoche (1912 model), and when I suggested fitting a sidecar my friends rather doubted that it would be capable of pulling one with satisfactory results.

I have, however, now run the combination a considerable distance, and the way it travels is really remarkable for such a small h.p.

The photograph enclosed was taken on the front at Yarmouth, for we have just completed a holiday trip of about 300 miles. The journey down from London took nine hours, making an average speed of fifteen miles per hour,

A single-cylinder Motosacoche which successfully pulls a sidecar. (See accompanying letter.)

for we spent a little time on the road repairing the rear cover, which burst just outside Saxmundham.

Unfortunately, the pleasure of the ride was somewhat marred by the wet, for it rained all the way down until we reached Lowestoft. By the way, all hills, although there are not many steep ones on this route, were climbed well, and without any "l.p.a." It came up East Hill at Colchester on the return journey very well.

The return journey was successfully accomplished in about the same time, although we were delayed with some belt troubles between Brentwood and Romford, which, however, were soon remedied by inserting one or two new links, for it is a Whittle belt, which really stood the extra work exceedingly well.

The engine is fitted with a Motosacoche variable gear, which proved very efficient. The sidecar is a Middleton, I chose this type as being the most suitable, owing to its being light, yet strong and comfortable.

I am of opinion that this combination is the smallest set on the road capable of giving such results with a passenger, and I think it speaks volumes for the reliability of the Motosacoche engine, for it has not given the slightest trouble.

I think it only right to add that the makers do not recommend fitting a sidecar to the lightweight machine, as they say it is not intended for such work. I dare say it is putting an excess strain on the frame, but I have found it stands up to the work wonderfully well. H. WINGROVE.

Hub and Counter-shaft Gears.

Sir,—As gears and transmission systems seem to be claiming much attention at present, perhaps my experiences may prove of some interest.

I have ridden my 6 h.p. No. 2 Bat 3,700 miles to date, 550 miles of which have been with sidecar and chiefly in North Wales. The belt has been shortened once, and has never pulled through or slipped, and positively looks brand new. I use a top gear of 3.5 to 1 for solo, and 4 to 1 with sidecar. The Armstrong gear has never given the slightest trouble, and runs perfectly silently. I may add, that I always give the magneto cut-out a momentary jab as I change gear, which eases the driving pressure.

The belt drive I consider ideal for a motor cycle if run on large pulleys, but the fault with most machines having counter-shaft gear and belt is that the pulleys are then too close, and the drive rendered harsh. In my opinion an ideal machine would have a three-speed sliding gear box incorporated with the crank case, but in front, and the drive by a six or seven inch pulley and 1½in. belt.

EXPERIENTIA DOCET.

Sir,—Regarding the controversy now taking place on the merits of hub and counter-shaft gears, may I be allowed to give my experience with hub gear?

My mount is a 3½ New-Hudson, 1912, fitted with a Canoelet sidecar and Armstrong three-speed gear. The machine has now run 4,683 miles, and has never been troublesome. It weighs, together with sidecar and spares, 350 lbs. My weight is nearly 14 stones. My wife is 13 stones, and my son 5½ stones. I have traversed some of the worst roads I should think it possible to find, through the Peaks of Derbyshire, and round about Lancashire, and neither the machine nor gear has ever failed me up to the present.

I must be a little more fortunate than your correspondent, Mr. W. McLean. I have not experienced the belt trouble he complains of, neither have I experienced the trouble of grit getting into the free-wheel and grinding itself useless. Neither have I found any difficulty in getting the back wheel out when it has been necessary to repair a puncture or replace a cover. True, the weight in the hub somewhat slows the machine, but it is nothing to speak of. It also, by its extra weight, has a tendency to wear the tyres out a little faster. I accomplished 1,379 miles on my driving wheel tyre, which was a well-known make, and very little more on the front wheel and sidecar which I had retreaded.

A. RYALL.

Sir,—Having ridden a two-speed counter-shaft Premier about 3,000 miles this year, mostly with a sidecar, perhaps I can add a word to your interesting correspondence.

To my mind there is no doubt the drive is noisy, but the pull is splendid and the belt needs no touching at all. The only fault, to my mind, is there is no way of lubricating the chain with any ease. I have removed my cover altogether and find the chain runs much better, as I can apply graphite to it. My luck with chains has not been good, as I have found several rollers broken after about two months' use.

CONSTANT READER.

[We cannot agree with our correspondent that running the high speed chain exposed is better than covered. It is against all good practice, and probably the broken rollers he complains of are caused by lack of proper protection for the chains.—ED.]

Carbon on Sparking Plugs.

Sir,—I was much interested in your article "A Strange Experience." I see you state that inserting a small extra spark gap in the circuit intensifies the spark at the plug, and offer as a proof, the fact that the small external gap will burn away the carbon on the points of a sooted up plug. Now, whether there are two gaps in the circuit or only one, the magneto gives out practically the same amount of energy at each break of the primary circuit, if the speed be constant; nearly all this energy is dissipated in heat at the gap, the ohmic resistance of which is great compared to the rest of the circuit. By adding another gap in series, of about the same length as the plug gap, the heat will be equally divided between the two, hence there is less at the plug. The explanation of the external gap, clearing a sooted up plug, is as follows: With a clean plug, the high tension leads, etc., have quite an appreciable electrical capacity as they pass near the frame, so the current from the secondary of the magneto charges up this capacity until the voltage is high enough to break down the air gap. The discharge then takes place, the current which flows across the points being considerably greater than that produced in the secondary at any moment, but is of much shorter duration, hence the total energy remains the same. Now with the plug sooted up, the current flows round the circuit without ever charging the capacity, since current is simply the maximum secondary current of the magneto and is insufficient to burn away the carbon. As soon as an external gap is introduced, the capacity effect is re-established; the resistance of the carboned up points is greater than the rest of the metal circuit, and as a large current flows (though only for a short period) the heat produced is sufficient to burn away the carbon. In short, without the extra gap, the heat produced at the carbon is low and of comparatively long duration; with the extra gap it is high, though of very short duration.

It may interest some of your readers to try the effect of a small capacity shunted across the plug. With this, sooting up seems to me to be practically impossible, though unless a switch is fitted to cut out the capacity, the starting is difficult, and also the points are burned away far more rapidly.

JOHN F. B. CARSLAKE.

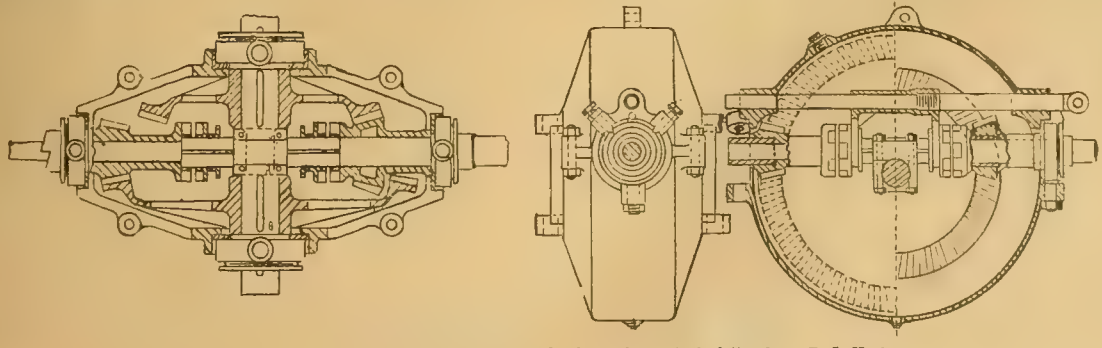
The Differential—Yes or No?

Sir,—With reference to the letters in *The Motor Cycle* as to substitutes for the differential in small cars, I enclose a sketch of the drive of a small car, a Ridley, which I had in 1903, which was quite efficient. The drive was by two bevels, one for each speed, and though the engine was only a 3½ h.p. De Dion the car would take two people quite comfortably. Free wheel clutches were fitted to the driving wheels. The next car I had was a Swift, with a 6 h.p. De Dion engine, driven on the same principle. This car, unlike the former, was fitted with a reverse, which was obtained by locking one driving wheel, and this was quite practical.

FRED. J. HARKER.

The Silencer Question.

Sir,—It may interest your readers to know that I received a summons for making noise with an 8 h.p. Zenith in Birmingham. The case came on for hearing on 19th September, and was dismissed. The Zenith has two long exhaust pipes flattened at the ends and drilled with about one hundred small holes. The noise is not there at all, but



Section of the 1903 Ridley voiturette double bevel drive, referred to in letter from F. J. Harker.

a quiet purr of the twin. A plain clothes policeman arranged the summons on the fact that I had no silencer or expansion chamber. I contended I had both contained in the long pipes, and decided to plead not guilty. I had no cut-out at all, and this seemed to satisfy the Judge that I had indeed tried to get noiselessness. The case came up as follows. I was accosted one evening on going home by a plain clothes man on a cycle. He asked me if he might have a word with me, and I asked what he wanted. He replied that I should have to dismount to hear what it was. I considered it impudence from this person, who ever he was, and refused to have anything to do with him, and so went on. The Judge thought there was no evidence of noise, at least made knowingly, but said that he thought that I knew well that it was not simply a man wanting to waste my time. I assured him that the word "police" never entered my head at all, and that the policeman had only to say he was an officer, and I should naturally have got off. However, it is a warning to others that those who imagine that they are safe are not. The fact that a motor cycle has a silencer is nothing in its favour. I was summoned because of alleged noise. F. R. SWINBURNE.

The A.C.U. Trial for Cycle Cars.

Sir,—The A.C.U. have given proof of their interest in the cycle car movement by the announcement of a trial in October and the T.T. race in 1914. For my own part I believe, as you do, that eventually all light passenger machines must compete together; but, just for the present, there is no doubt a strong feeling that the movement will be helped by a trial for cycle cars only. There are a number of cycle cars (by no means all) which are not able to compete with sidecars on equal terms, but which nevertheless seem to possess some merit. May I venture; however, to suggest that if the trial is made easy in regard to hills and road surfaces it should be made equally easy as regards timing? It would be distinctly hard luck if a machine which was capable of a far more severe test failed because the driver made a mistake of a minute or so at controls. The fact that the trial is known to be comparatively easy, and "geared down," if I may say so, to the capacity of less efficient machines, makes failure more serious. The man in the street will say, "Oh, the X.Y.Z. is no good, it couldn't even get through the Cycle Car Trial." He will not stop to consider the reason. If it is thought necessary to differentiate between the successful cars, a flexibility test is perhaps the most satisfactory method, unless your suggestion of a fifty miles' spin at Brooklands be accepted. H. GEORGE MORGAN.

An Undesirable Practice.

Sir,—No doubt your article on "Carrier Riding" was prompted by kindly motives. The practice is fraught with danger, and fatalities occurring through the burdening of the carrier with a passenger, especially as you hint, of the fair sex, are derogatory to the pastime.

Now, I am not suffering from the "headstrong rashness of youth," and am, I feel sure, of a sober mind (at least at present), yet when you speak of prohibition by law my blood boils at the thought. I do detest this prating of law, law, law! The law was not meant to be a mothering institution. Legality was never intended to say, "Now, Johnnie, you must not climb trees."

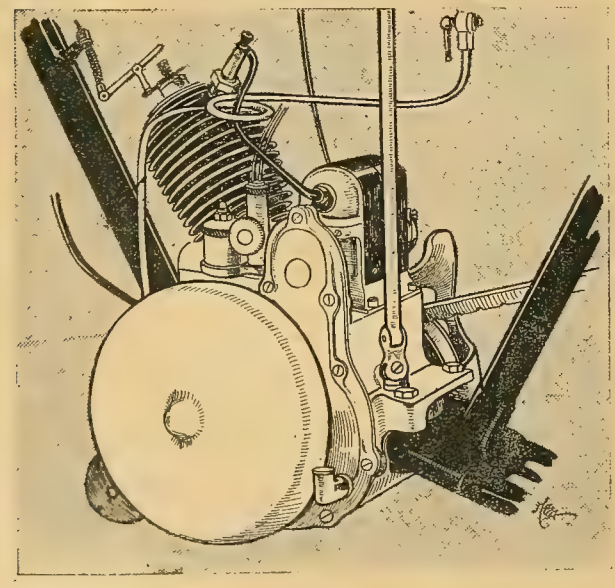
No, if men care to risk their lives by flying (upside down, if you like) why—let them fly. Apply this to the question at issue. Let us choose, and be ourselves responsible for at least some of our actions. A famous poet writes:

It matters not how strait the gate,
How charged with punishment the scroll;
I am the master of my fate,
I am the captain of my soul.

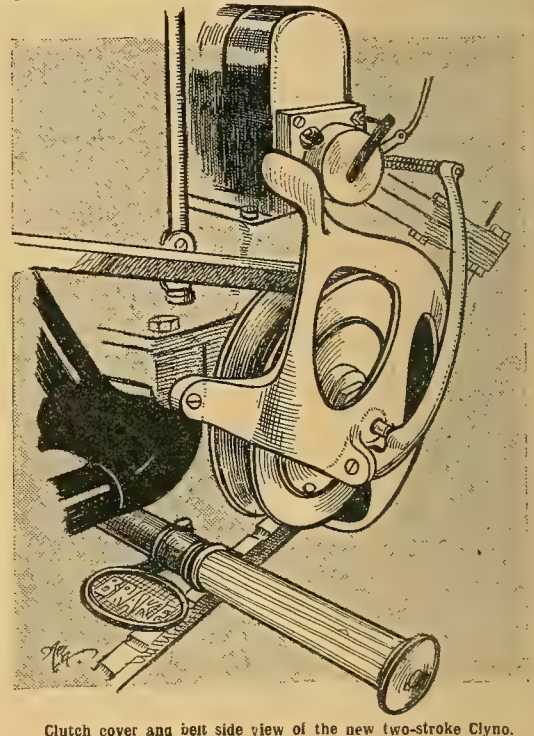
J. A. ALLEN.

THE NEW 2½ h.p. TWO-STROKE CLYNO.

QUITE the most interesting machine at Alms Hill last Saturday was the new Clyno. It has an inclined cylinder, and the outside flywheel, to use an Irishism, is enclosed; that is to say, it is outside the crank case but enclosed separately to avoid mud slinging. The engine works on the two-stroke principle, is fed with gas by an Amac carburetter, and fired by a Bosch gear-driven magneto. On the top of the cylinder is a decompressor to free the engine for starting purposes. The gear box containing two speeds of the sliding type forms a unit with the engine. The accompanying sketch shows the neat universal joint at the base of the operating rod. The engine pulley contains a plate clutch, and the belt is amply guarded at this point. The lubrication is by oil mixed with the petrol, a principle employed on the Connaught and also on many American two-stroke engines designed for marine work. The petrol consumption is said to be 110 m.p.g.

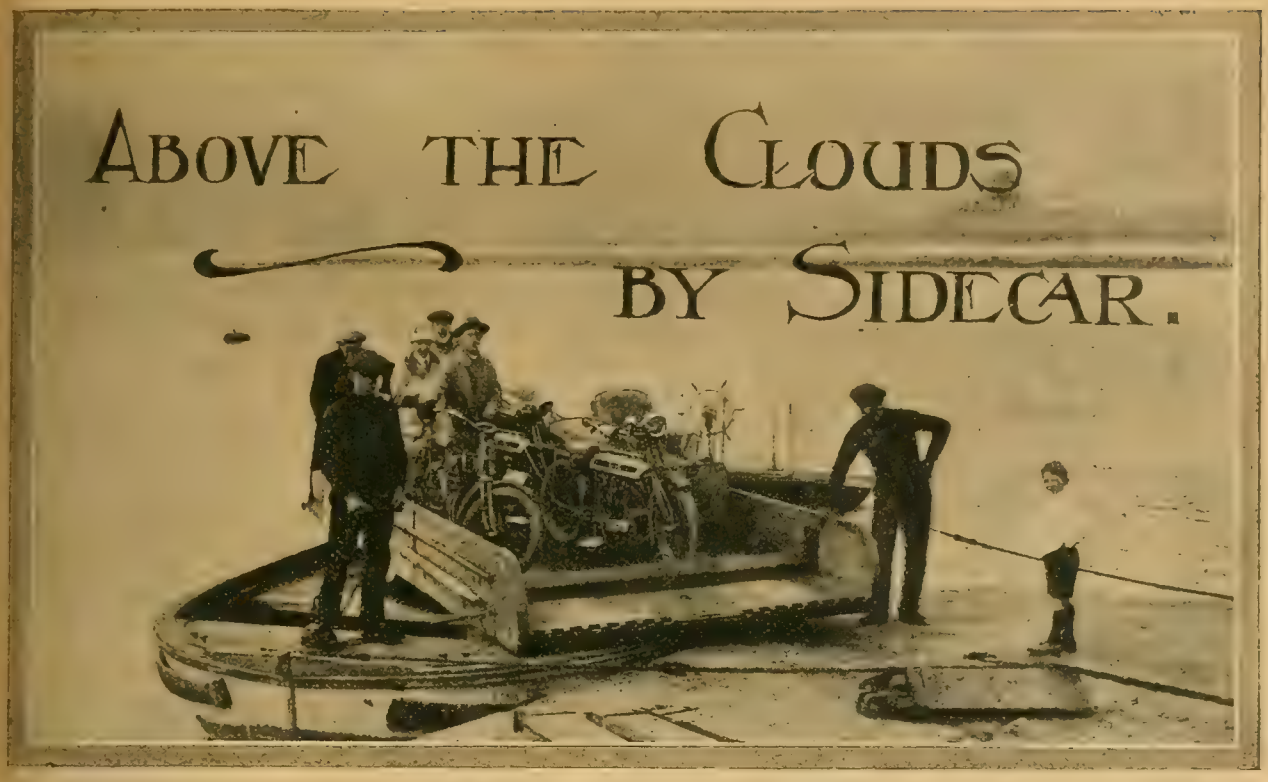


Flywheel side of the 1914 Clyno motor bicycle—a 2½ h.p. two-stroke single-cylinder. The belt is on the right hand side.



Clutch cover and belt side view of the new two-stroke Clyno.

ABOVE THE CLOUDS BY SIDECAR.



At the Ballachulish ferry on the way back to Glasgow.

ONE morning recently when the streets of Glasgow were bare and deserted, a small party of enthusiastic motor cyclists gathered in a garage in the western district of the town, and shortly after might have been seen leaving tenemented streets by way of Great Western Road, the main outlet to the mountains and lochs of the West. The object of the day's journey was known only to themselves and a few close friends, and none guessed that they had designs upon the ascent of Ben Nevis, the highest mountain in the kingdom, by motor cycle and sidecar.

The trip was the outcome of a long-cherished notion of the leader of the party, Mr. D. Bell, the West of Scotland agent for A.J.S. machines. The party consisted of five members, who were accommodated in two A.J.S. sidecar combinations and a solo 5 h.p. F.N., a fair passenger occupying the seat of honour in the sidecar which, it was expected, would, before the mantle of night descended o'er the Ben, have reached the highest hotel in Great Britain.

The journey to the Argyllshire town of Fort William, whence operations were to be commenced, was not without its charms. In the morning mist Loch Lomond resembled an immense sea of glass with the surrounding peaks mirrored on its still surface. The towering Ben Lomond, reaching to a height of over 3,000 feet, gave us some idea of the magnitude of the task before us, but in the enjoyment of the surrounding beauties thoughts of the struggle to come were banished from our minds. Through the picturesque Glen Falloch, which might be termed the "Gateway to the West Highlands," the road ascends somewhat, thereafter skirting the bases of the majestic Ben More and Stobinian, which guard the entrance to the calm and peaceful glen.

Progressing onward, our road strikes north over the bleak and desolate moor of Rannoch, where the long pull up the Black Mount is a test of low gear work. This rises to a height of over 1,500 feet, and a glorious prospect is viewed from the summit. In front are the peaks of Lochaber, surmounted by the grim and frowning heights of Ben Nevis, the centre of our thoughts.

An Expensive Crossing.

We experienced some little delay in getting across the ferry at Ballachulish, where, for ferrying a distance of about 200 yards, they charged us ten shillings for the three machines and the passenger. We were now within sight of our destination, and were all eagerness to start the conflict with the steep and precipitous sides of the mountain.

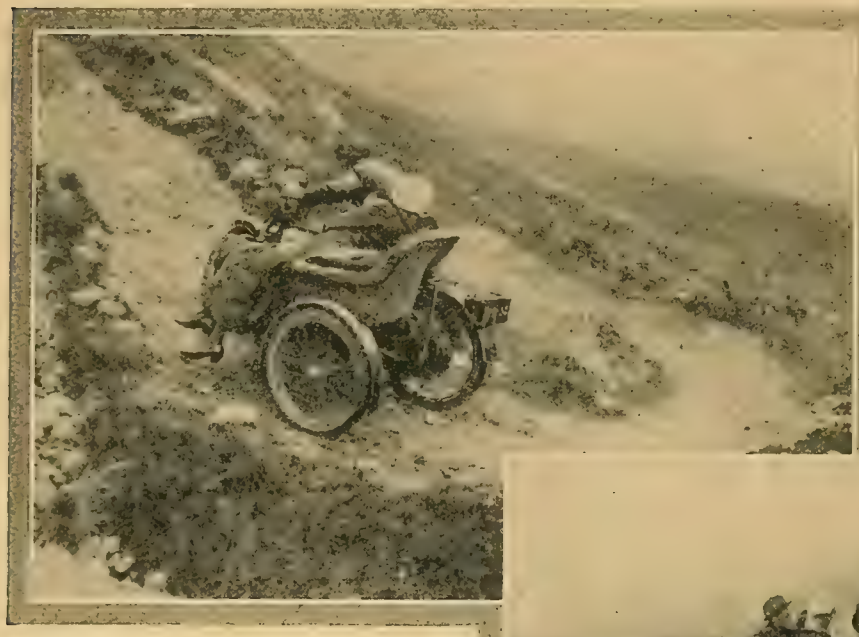
As it was somewhat late in the afternoon, we did not lose any time in getting to the foot of the mountain, arriving there about three o'clock, and in the afternoon sun the surrounding peaks stood out boldly against a cloudless sky.

The Beginning of the Struggle.

The narrow and rocky path above us appeared impossible of ascent, but, losing no time, the plucky rider of the A.J.S., with the lady passenger in the sidecar, was soon threading his way among the boulders and ruts, and the first ascent of Ben Nevis by motor cycle and sidecar had commenced. Turning over at a fine rate, on a low gear of 16 to 1, the

Above the Clouds by Sidecar.—

machine made light of the steep gradient, and soon covered the first half-mile. Thereafter the path became narrower and the surface deteriorated, necessitating great care in negotiation, and the slightest slip on the part of the driver would have been highly dangerous. Showers of stones and dirt were thrown backwards by the revolving wheels, and the smell of burning rubber from the tyre permeated the surrounding atmosphere. The higher we progressed the steeper and more awful became the track,



(1) One of the many hairpins on Ben Nevis.

and in one place the back wheel sank up to the chain cases in black, sticky mud, caused by water on the loose surface. At one point it appeared that the ascent would have to be given up altogether. Huge boulders lay on the path, and a watercourse ran right down the centre. By some superhuman effort the rider, however, surmounted this difficulty, and, continuing at about ten miles per hour, covered fully a quarter of a mile before coming to a halt again.

Darkness Necessitates a Halt.

Darkness now descending, it was deemed advisable to abandon the climb for the day and proceed to our headquarters in Fort William on foot.

Mid-day on the morrow found us again with the A.J.S., and it was splendid to see the easy manner in which the machine started at the first kick. After having lain overnight in the mountain mist, this was an excellent demonstration of the easy starting capabilities of a modern motor cycle.

Now came one of the most trying parts of the ascent. Great stones covered the track, and the first hundred yards occupied us fully half an hour. At one portion it was deemed advantageous to take to the grassy sides of the track, but these were even worse than the track itself, which was joined a little further on. Up past the half-way house the combination had three up, a passenger being carried on the carrier. Rapid progress was now made, and, although the surface was, if possible, worse than any they yet experienced, a point about a mile from the top was reached without any untoward incident. Here, however, the back tyre, which had been showing signs of the terrible ordeal to which it had been subjected, burst with a loud report. An old spare was substituted, but only a few yards had been covered before it was decided to desist for the day. One of the party tramped to the summit of the mountain and stayed overnight, while the others journeyed afoot to Fort William.

Third Day of the Climb.

Saturday was spent in a return to Glasgow for new tyres, and on the Sunday morning these were fitted and the climb commenced afresh.

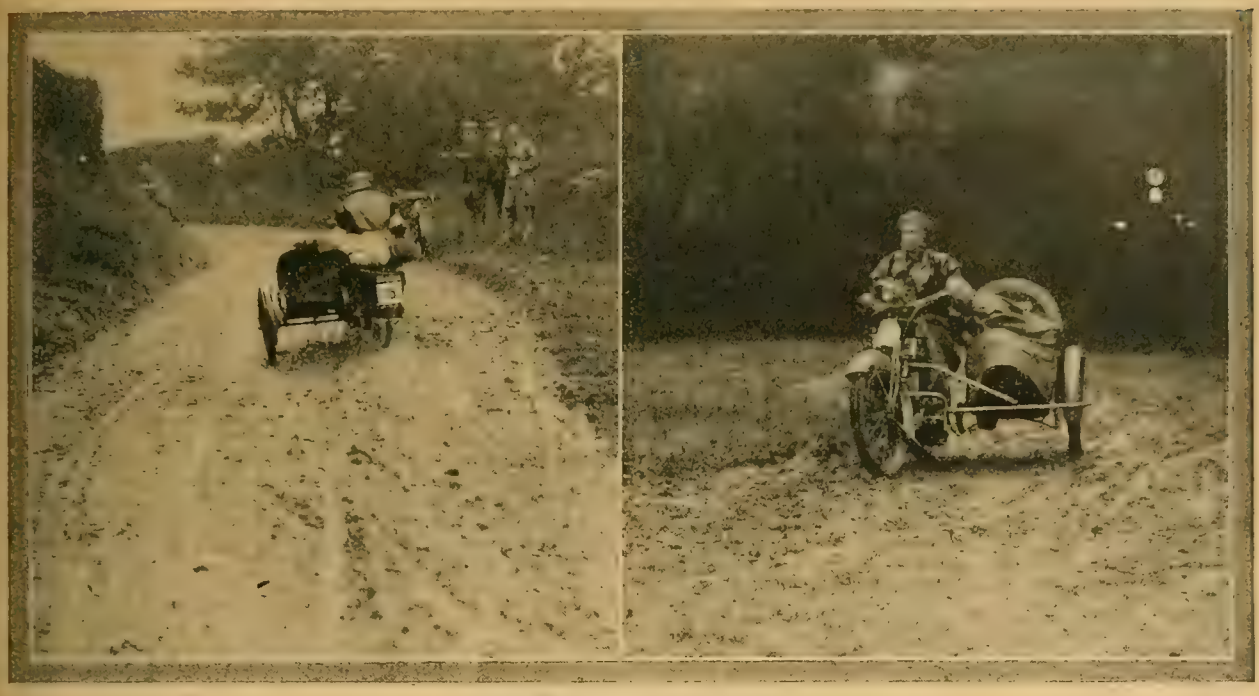
(2) Keeping the combination from running over the side of one of the hairpins while being photographed in the mist near the top. For three miles the surface is as rough as shown.

Gradually ascending yard by yard, rounding hairpins with gradients of appalling steepness, the party slowly neared the top of the mountain. In addition to the terrors of the track, the mist descended, completely blotting out the surrounding scenery, and, with nothing but a blank white wall all around, the roar of the engine was the only sound which disturbed the solitude of the scene. Nearer and nearer we got to the summit and the level stretch at the top, and soon the first ascent of Ben Nevis had been accomplished by a motor cycle and sidecar.

J.L.G.

SEVERE TRIAL IN NORTH WALES.

Liverpool A.C.C. Open Reliability Trial.



CILCAIN, THE FIRST TEST HILL.

O. Wade (5-6 A.J.S. sidecar). G. Wray (5-6 Clyno sidecar).

ON our way to Queensferry, the starting point of the Liverpool Auto Cycle Club's reliability trial, last Saturday, we called to inspect a hill out of Llangollen known as Altybady, which the solo riders were expected to climb, and, having failed ignominiously at the first attempt on a low-geared mount, formed the opinion that if the rain continued it would prove an effectual stumbling block to the competitors. The hill in question has a gradient of quite 1 in 4, but that is not all: deep channels cross the road, and in wet weather the mud is thick and holding, and can best be compared to Porlock, the Somersetshire terror. We saw, among others, two A.J.S. riders who had made ascents, also the riders of two 3½ h.p. Humbers, but each profited by practice, for at the first attempt they had come to a standstill.

We broke the news very gently on arrival at Chester, but the competitors, now accustomed to hearing tales of "impossible" hills the night before the trial, and having such confidence in their mounts, were inclined to doubt whether anything short of a church steeple could stop them. Tessier, for instance, was open to lay odds that nothing could stop his Bat, and Bees, practised in the art of freak hill-climbing in the Six Days' Trial, was of the same opinion concerning his L.M.C. As events proved, only two succeeded in making clean ascents of the hill, though others got up under engine power, but having to steady themselves with their feet.

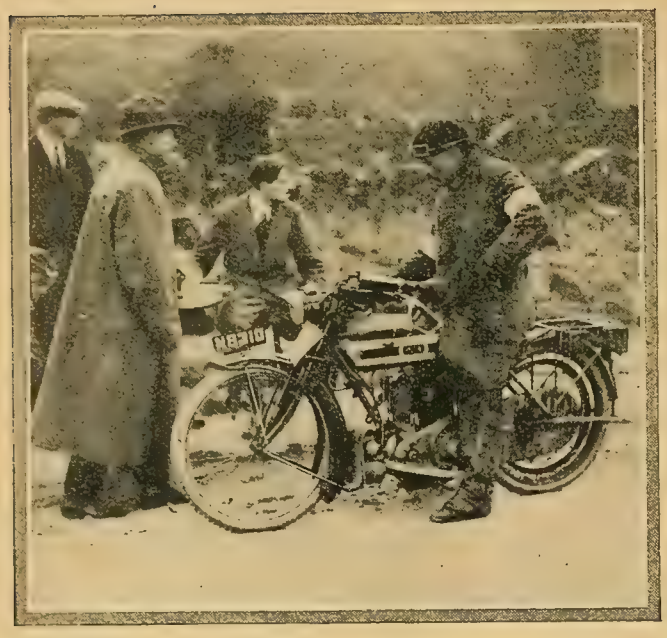
A Representative Entry.

The trial was one of those selected for manufacturers' support, ninety-five entrants appearing on the list. Among these were six each Triumphs and Clynos, five Sunbeams (including the 1914 model 3½ and 6 h.p.'s), several Quadrants, A.J.S.s, and Bats, whilst two-strokes were represented by Scott, Levis, and Connaught. Among the entrants were Mrs. and Miss Baxter, who rode a 6 h.p. Rex and a Connaught respectively.

A prize offered for the best performance on a single-geared machine tempted a number to start with a fixed ratio, but we feel certain that they would decide differently if the trial were re-run. Among these was a Rudge converted to chain drive and belonging to T. E. Greene, the Grand Prix winner, who had come over with a Dublin team, and two Rovers ridden by Orde and Ne some.

Thanks to explicit information and route cards having been forwarded by post to each competitor in ample time, the start was effected in orderly fashion, Mold and Denbigh

Hugh Gibson (twin-cylinder Bradbury sidecar) climbing Llanfair Talhairn.



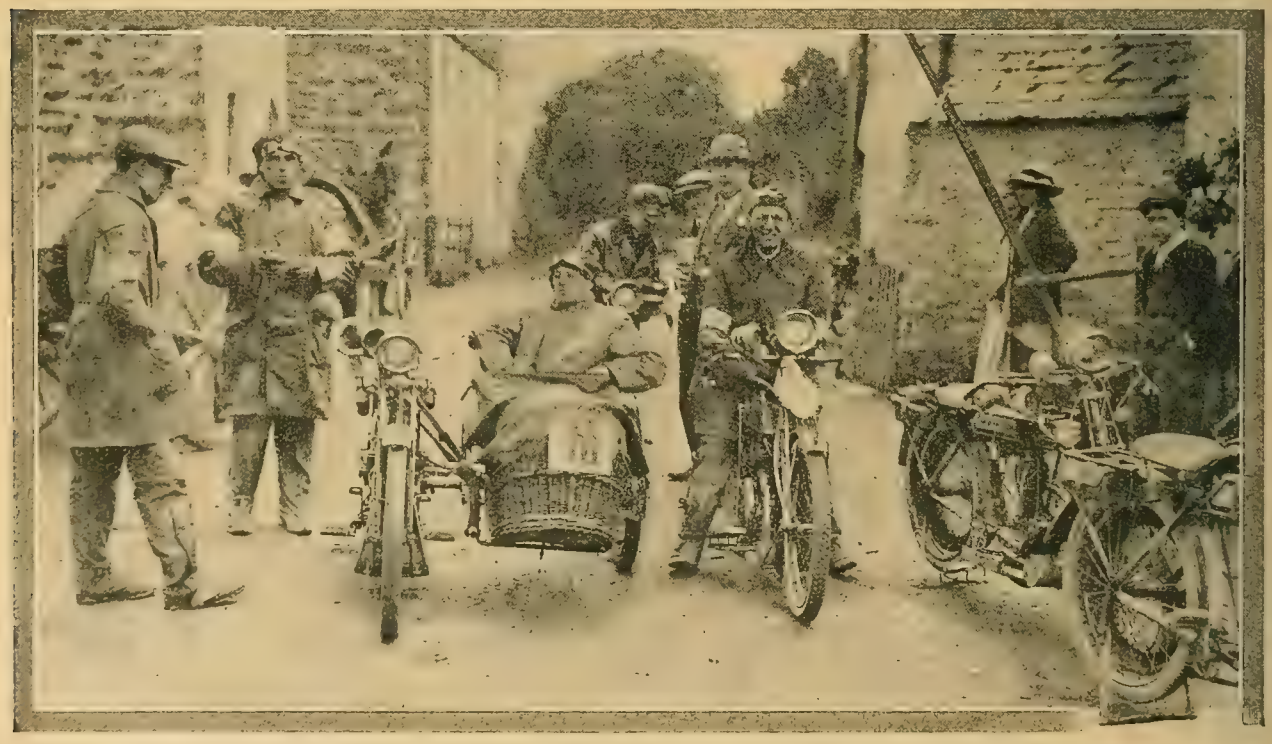
W. Heaton (2¾ h.p. A.J.S.) at a secret check. Heaton and Brown (Indian) were the only riders to climb successfully the last test hill.

being the places first visited. Main roads were not the usual order, miles of by-lanes being covered in order to include test hills. The first of these was Cilcain, which was in a very heavy state. This hill has accounted for many a rider in previous trials, but the right hand bend this time was as slippery as it could be. No less than thirty riders thus early lost their chances of a non-stop. Coopland's Indian sidecar skidded almost completely round, Gregson (Bat) and Greene (Rudge) followed suit. H. G. Bell (F.N.) sideslipped and damaged his change-speed lever. Whilst fixing up a repair, Mrs. Baxter almost collided with him owing to a skid. Fox (Matchless) stopped owing to his gear lever jumping out of engagement. C. T. Newsome found the hill too much for a single gear, and Haslam (Rover sc.) was under-powered. A. J. Stevens stopped simply owing to the back tyre failing to grip the slippery surface. There were only three cycle cars in the trial—a Morgan and two Humberettes. H. F. S. Morgan and S. Wright made good climbs and were applauded by a number of fallen riders. A privately owned Humberette was not so successful.

Then followed miles of twisty and narrow roads, over which a 20 m.p.h. average was expected, but it was next to impossible. The sun hereabouts made its appearance and had the effect of making the road surfaces still more tacky. The solo riders had a very anxious time, riding with their legs dangling. Quite a dozen sideslipped and damaged their machines. We passed F. Dover (Premier) very late by the roadside, and he called out "gear." Later we caught up with Miss Baxter cooling down at the foot of a long rise after Henllan.

A Long Climb at Llanfair.

The second real test of the morning's run was at Llanfair Talhairn, where the spectators saw many riders skidding up the hill from one side to the other, passenger machines with their driving wheels buzzing round, and many stopped altogether. Those who found Cilcain too much for them were mostly unable to climb this tongue twister, though Stevens this time was successful. Morgan stood still with his back wheel churning a deep groove in the mud. Llanfair Talhairn is about a mile in length, and many an engine knocked before the summit was reached. The corresponding descent to Llangerniew proved highly dangerous. Competitors descended crabwise at walking pace, being jolted into and out of stone gulleys formed across the road; at times the gradient was so steep that one could not check the progress of a machine by locking the back wheel. H. Silver's Quadrant got out of hand (it was the rider's first competition), and rider and machine charged the bank, fortunately without doing much damage. Yet over all this terrible going competitors were expected to risk their necks and average 20 m.p.h. (Subsequently a time allowance was made.) Passing on these narrow roads was practically impossible. A. J. Stevens attempted to pass Wright's Humberette and cannoned a bank, which nearly spoilt his chances, and the Humberette was later held up for over a mile by a pony and trap. Indeed, so many competitors must have been a nuisance on these narrow



Scene at the check at Llangerniew. The competitors are: H. C. Marston (3½ h.p. Triumph sidecar) and J. S. Watson (Sunbeam).

Severe Trial in North Wales.—

roads, for sheep and cattle were constantly met. A water-splash followed, and two at least were stopped, the belt of Mundy's Triumph refusing to grip, apparently owing to the pulley groove having worn, and Sixsmith (Scott), who fell. Then followed a grass grown track, which improved to Llangerniew, where a time check was arranged for those who had taken risks to average 20 m.p.h. By now the competitors were beginning to wonder what competitions were coming to—acrobatic performances on by-lanes or tests of reliability and hill-climbing. W. H. Carson (Excelsior sc.) had been delayed by his throttle slides sticking, which nearly led to an accident, as he descended one hill with the throttle wide open. The rider's presence of mind in snatching the high-tension wire off the plug saved the situation.

After Eglwys Bach there followed one of the most difficult tests of the day, viz., Pennant Hill, a long climb up a single figure gradient certainly approaching 1 in 4 and covered with a thick coating of real Welsh grease. Again the bunch who had failed previously konked out, but one of the most wonderful climbs was by Marston on a Triumph sidecar. He is the same rider who did so well in the Six Days Trial, and was again able to show solo men with as much engine power as he possessed that there is a great deal in handling a machine correctly. Cocker (Singer) skidded and stopped, and No. 4 (Clyno sc.) left a few more ounces of rubber from his back tyre, which persisted in slipping on the worst hills. Scott (Premier sc.) suffered in the same way. The A.J.S., Triumphs, Bats, Sunbeam, and Diamond teams to a man accounted for the climb.

At Llanrwst a tremendous drove of sheep was encountered. Horsman (Singer) swung round a corner and ran into one of them, both finishing in the hedge. The rider was surprised to find that the sheep was killed. The shepherd demanded 30s., so Horsman wisely left his card. Ayres (Villiers) was stopped on a hill due to the back cone screwing up and locking the hub. After putting matters right he blew a cover off the rim, and so retired.

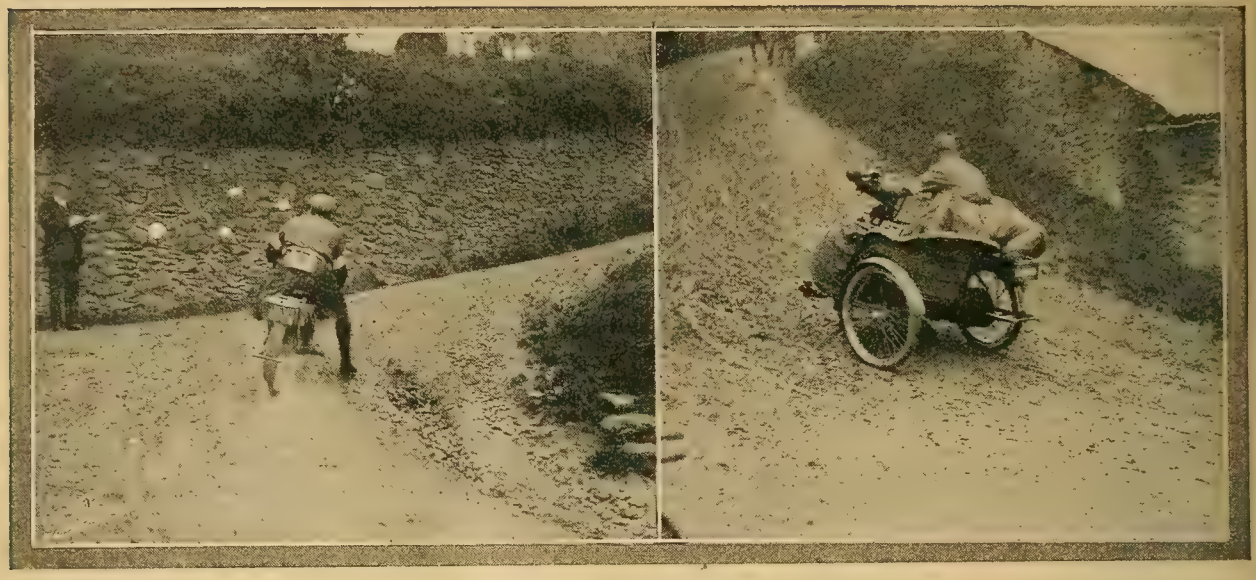
The Pass of the Cross.

At Bettws-y-Coed (66¾ miles), where lunch was taken, the mud bespattered machines told their tale of the road traversed. Many showed signs of falls. Blaenau Festiniog was the commencement of the afternoon run to Maentwrog, the scenery on this section being much admired. Out of Maentwrog there was another test hill, though not so severe as the others. At Dolgelly there was another check, and then over the mountains to Dinas Mawddwy village and up Bwlch-y-Groes, which still remains, in our opinion, the fairest and most gruelling test for an engine we have ever encountered. Many more records were spoilt on the "Pass of the Cross," Marston having to run beside his Triumph sidecar for a few yards, though this did not affect his award, as the 500 c.c. passenger machines were allowed to fail on one hill and then gain a gold medal. The little Hobart, ridden by Dudley, made another surprisingly good climb, for the engine is only 290 c.c., and Fenn, on a new three-speed counter-shaft geared B.S.A., which we understand is a forerunner of the 1914 model, got up very well. Two Clynos found the gradient too much for them, but Frank Smith (who made a reappearance in competition) and R. Pearson made no mistake. The Quadrants seemed to have plenty of power, and, as usual, all the Sunbeams made a fine show. Hugh Gibson's new twin Bradbury, which is now approaching its thousandth mile, got up comfortably. The Levis, ridden by Newey, again showed what an efficient little engine can do. By the way, this rider rode up from Birmingham the same morning, starting at 4 a.m. After the trial he went home by train, hitched a sidecar on to his machine, and next day competed in the local club's twelve hour event. Of the cycle cars on Bwlch-y-Groes Morgan stopped apparently owing to overheating, whilst Sam Wright drove his air-cooled Humberette to the summit in great style, passing two solo riders on the way. The Diamonds emitted a sharp crackle and got up in style, Davies doing particularly well. Cocker told us that he changed to top gear after the corner and almost completed the climb on top.

A Surface like a Quagmire.

There was a fifteen minutes halt for tea at Bala, then on to Corwen and Llangollen, where the solo riders branched off to the right to climb Altybady, which was in a frightful state. It was almost shameful to see competitors who had covered so many miles and successfully climbed so many severe hills floundering about in the mud and being bumped over the gulleys. To steer a straight course was impossible, and unfortunately there was only a strip two feet wide fit to ride on. The hill, as well as the surface, much resembled Porlock in the 1912 Six Days Trial, and we consider that the Liverpool club had a great deal of pluck in including it, especially in the light of the complaints regarding freak hills in the A.C.U. Six Days Trials. There were none, however, so bad as Altybady. Some of the performances are recorded on the next page.

Mrs. Baxter (6 h.p. Rex) in the watersplash near Llansannan.



SCENES ON LLANFAIR TALHAL RN.

(1) C. T. Newsome (Rover), who pluckily attempted to take a single-geared machine through the trial.

(2) One of the A.J.S. sidecars on the same corner. The position of the passenger will be noted.

E. F. Baxter (6 Rex), good for best part of the hill, but had to foot-slog; he eventually skidded across road. It appears that the low ratio of his engine-shaft gear was inoperative.

W. Heaton (2¾ A.J.S.). Splendid ascent.

C. Wilson (Quadrant) failed just round first bend.

F. G. Edmond (3½ Humber) almost reached top, but a belt fastener broke.

C. T. Newsome (3½ Rover) foot-slogged all the way from first bend.

S. Tharp (3½ Triumph) failed on first bend.

R. F. James (6 Rex) nearly reached top, then skidded and dashed into bank.

L. Guy (Scott) petered out

J. B. Sproston (2¾ Sunbeam) stopped near top.

A. J. Dixon (3½ Singer). Very good as far as he got, then clutch gave out, and he stopped.

S. C. Perryman (3½ Quadrant) failed at first bend.

A. G. Fenn (3½ B.S.A.) almost succeeded, foot-slogged at top and was assisted.

J. Cocker (3½ Singer) jumped off half-way between the two bends.

J. Baker (3¾ Scott) skidded and charged bank.

D. H. Noble (3½ Rover) stopped near top.

V. E. Horsman (3½ Singer) stopped with his engine buzzing near top.

S. Sawer (3½ Premier) ran alongside when the engine knocked between the bends and reached top.

C. E. Nokes (3½ Sunbeam). Clever climb; kept in saddle while paddling and dancing for forty yards.

J. A. Dudley (2½ Hobart) failed first bend.

L. Park (2¾ Douglas) foot-slogged and stopped.

S. Doward (3½ Bradbury) stopped.

G. Featherstonhaugh (3½ Rover) stopped.

R. G. Mundy (Triumph) came to rest well up hill.

S. T. Tessier (6 Bat) stopped near top.

N. H. Brown (7 Indian) second clean ascent, sensational and fast climb.

H. Newey (2½ Levis) stuck in gutter, assisted out and then got up.

S. Tubb (3½ Humber) stopped near top.

J. H. Fox (5 Matchless) charged bank.

A. W. Brittain (3½ Bradbury) ran all the way from the first bend.

J. S. Watson (2¾ Sunbeam) skidded into the gutter.

L. Mogridge (2¾ Mead) stopped well up.

F. W. Sixsmith (3¾ Scott) failed, and charged bank.

A. H. Mee (2¾ Diamond) nearly succeeded.

W. Y. Ford (2¾ Diamond), bad skid and failed.

W. Jones (A.J.S.) passed very late. He was obliged to assist his machine.

Longton (Alldays) had the bad luck to have his change speed rod break. Fastening the low gear home, he actually made the third successful ascent of the hill.

The stragglers had a very anxious time, for they had to light lamps before Llangollen was reached and climb the worst hill in the dusk. How the checkers went on we do not know.

The last section of the run was completed in darkness, two time checks being taken. The riders were thoroughly tired, for the run of 180 odd miles had been brimful of excitement, what with slippery roads and constant single figure gradients.

The provisional list of awards was issued on Saturday evening, but it is anticipated that the list of gold medal winners will be reduced rather than increased.

GOLD MEDAL WINNERS.

W. Heaton (2¾ A.J.S.)
O. Wade (6 A.J.S. sc.)
J. B. Sproston (2¾ Sunbeam)
A. G. Fenn (3½ B.S.A.)
Hugh Gibson (6 Bradbury sc.)
Frank Smith (Clyno sc.)
C. E. Nokes (3½ Sunbeam)
R. Pearson (Clyno sc.)
N. H. Brown (7 Indian)
H. Newey (2½ Levis)
H. R. Davies (2¾ Diamond)
V. Busby (3½ Sunbeam)
T. Silver (7 Quadrant sc.)
W. Jones (2¾ A.J.S.)
H. C. Marston (3½ Triumph sc.)
S. Wright (8 Humberette)

SILVER MEDAL WINNERS.

G. Wray (5-6 Clyno sc.)
F. G. Edmond (3½ Humber)
A. J. Dixon (3½ Singer)
L. Guy (Scott)
W. Court (6 A.J.S. sc.)
S. C. Perryman (3½ Quadrant)
J. Baker (3¾ Scott)
T. C. de la Hay (6 Sunbeam sc.)
V. E. Horsman (3½ Singer)
Rex G. Mundy (3½ Triumph)
D. H. Noble (3½ Rover)
G. Featherstonhaugh (3½ Rover)
C. S. Burney (3½ Blackburn)
S. T. Tessier (6 Bat)
S. Tubb (3½ Humber)
H. Silver (4½ Quadrant)
R. P. Ravenhill (3½ Rover)
W. H. Longton (3½ Alldays)
L. A. Bees (4 L.M.C.)
C. Freeman (Clyno sc.)
A. J. Stevens (A.J.S. sc.)

It is anticipated that the A.J.S. team will carry off the team award, for that trio made the unequalled performance of gaining three gold medals.

Of the gold medal winners six drove sidecars, one a cycle car, four motor cycles over 500 c.c., and five lightweights (which were allowed one stop on a hill).

Sidecar Touring in the States.

An American sidecar outfit. The absence of a mudguard to the sidecar wheel will be noticed.

The Harley Davidson luggage carrying tricar which accompanied a recent sidecar tour in the States.

The accompanying photographs show how a little sidecar tour is managed in the States. Half a dozen sidecar outfits, with their drivers and passengers, took part in a recent tour for three or four days under the auspices of the Milwaukee Motor Cycle Club. The luggage question had to be considered, so the tourists hit upon the happy idea of chartering a luggage-carrying tricar, which followed them from town to town, delivering their luggage to them at each night's halt. The vehicle which performed this useful duty was an 8 h.p. twin-cylinder air-cooled Harley-Davidson, a make of machine highly popular in the U.S.A.

CLIMBING BEN NEVIS BY SIDECAR. (See pages 1271-2).
The mountain climbers resting beyond the halfway hut. The little loch seen below is one of the highest in Scotland.

FURTHER SINGER RECORDS.

On Monday last, at Brooklands, B. Haywood, driving a 10 h.p. Singer, continued his onslaught on cycle car records, and succeeded in adding the following to his bag, in addition to those referred to on page 1268.

		Time.
150 miles	... ...	2h. 14m. 5⅘s.
	Speed, 67.12 m.p.h.	
200 miles	... ...	2h. 59m. 13s.
	Speed, 66.95 m.p.h.	

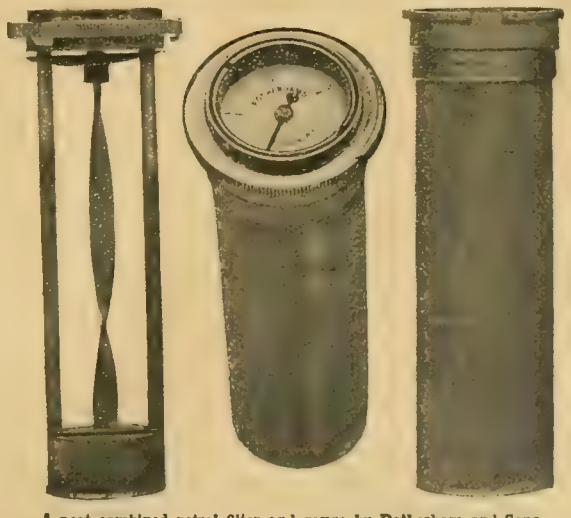
In two hours the Singer covered 134 miles 806 yards. Speed, 67.23 m.p.h.

In three hours 200 miles 1,542 yards were covered. Speed, 66.95 m.p.h.

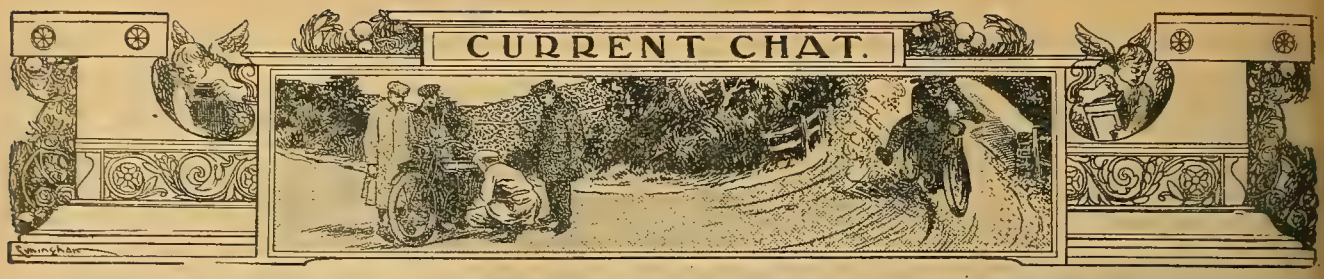
Monday's run had to be abandoned owing to engine trouble.

ROTHERHAM COMBINED GAUGE AND FILTER.

The combined gauge, tank stopper, and filter shown in the accompanying photograph, which is practically self-explanatory, has the advantage of dispensing with a separate gauze filter, the stopper and the gauge indicator being combined together. The fixing of the stopper is the same as the 1913 pattern marketed by Messrs. Rotherham, the gauge being formed by means of a cork float which travels up and down a spiral strip of metal, and revolves the indicator needle which is attached to the strip. The indicator dial is spaced out to show when the tank is quarter, half, threequarters, and full. The gauze filter surrounds the whole of the device, and no petrol can enter the tank without first passing through it. This article is a *multum in parvo*. A tank stopper is a necessity, a gauge is a desirable feature of any motor cycle, and a filter can be regarded as an almost indispensable refinement.



A neat combined petrol filter and gauge by Rotherham and Sons.



TIME TO LIGHT LAMPS.

October	2	...	...	6 36

,,	8	...	...	6.22

The Modern Reliability Trial.

Saturday's trial in North Wales of the Liverpool Club was very much like the missing sixth day's run of the A.C.U. Six Days Trials. Single figure gradients in by-lanes, terribly rough surfaces, and a watersplash were provided.

Sidecar Outfit Stolen.

Mr. Richard Bird, Ballydule, Queenstown, reports that his P. and M. and sidecar has been stolen in Salisbury. The registered number is IK 2, and the engine number S 1960. In the sidecar was a new Skew non-skid cover and a Gladstone bag. We are informed that this is the third machine that has been stolen lately in Salisbury.

The Gaillon Hill-climb.

We learn with regret from our contemporary *L'Auto*, that the motor cycle class in the Gaillon hill-climb has been cancelled, probably owing to the fact that the Motor Cycle Union of France does not recognise events run by newspapers. This fact will be a great disappointment both to the dozen or so British riders who expressed to us their desire to compete, and also to the French entrants.

Innovations in the London-Exeter Run.

The M.C.C. winter run to Exeter and back on December 26th and 27th will be over the same route as last year, but to add further interest for this year it is proposed to make one hill each way a non-stop section. Mr. Harold Karslake has been appointed to take charge of the run.

London-Edinburgh Without Stopping Engine.

A slight mishap to the Williamson sidecar which R. G. Mundy was to have driven from London to Edinburgh last week on a non-stop engine run caused the attempt to be postponed a few days. The sidecar was expected in Edinburgh last evening.

Continental Models in 1914.

Considerable improvements are announced amongst various Continental machines. The N.S.U., for example, we understand, will place on the market a type with gear box giving three speeds and possessing a metal to metal clutch. The N.S.U. gear lever as at present fitted will be discontinued, and the gear will be worked by a lever either on the frame or on the handle-bar. Two new Alcyons will be produced in 1914, one of 350 c.c. and the other of 500 c.c. The cylinders will be set at 60°, and the two-speed gear will form a unit with the engine. The first speed will be 50% reduction on the second. The 500 c.c. type will be specially designed for sidecar work. Terrot is also introducing a new model.

SPECIAL FEATURES:

CYCLE CAR ENGINES.

SEVERE TRIAL IN NORTH WALES.

BEN NEVIS CLIMBED.

Over 300 Miles per Gallon.

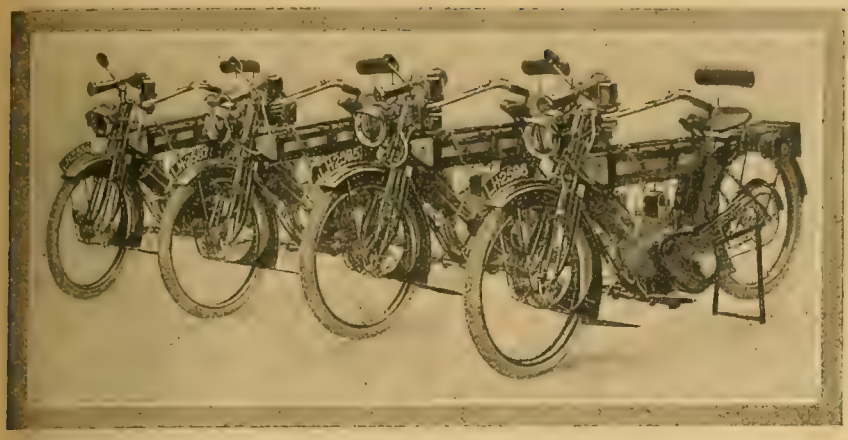
Last Saturday the Sutton Coldfield Club held a petrol consumption trial, and the announced results really make one gasp. In the solo class, two twin James head the list with 334 and 320 miles per gallon respectively, and a Singer cycle car was first in the passenger class with 87 m.p.g., an A.C. having the biggest mileage 101 m.p.g. We do not know the adopted means of checking the results, but we fear that many readers will require some amount of convincing that such remarkably economical results are possible.

Speed Trials at Weston.

The Bristol M.C.C., who are holding open speed trials at Weston-super-Mare on Saturday next, have obtained 120 entries for these events. A capital point is that half of this number are from club members, which shows that sporting events still receive plenty of support, and club life is by no means declining, as some would have us believe.

Elaborate preparations have been made for the smooth running off of the various events, and after crossing the finishing line competitors will return to the starting line by a separately marked off run.

INSPECTION OF THE ULSTER VOLUNTEER CORPS AT BELFAST BY GEN. SIR GEORGE RICHARDSON.
Part of the motor cycle corps.



Four P. and M. machines belonging to the Royal Flying Corps. They are fitted with Kempshall tyres and are very completely equipped, as will be seen from the photograph.

New Manchester Index Number.

Motor vehicles in Manchester have increased to such an extent that the Local Government Board have now granted a fresh registration number to the Council of the County Borough. The new number is NA.

The International Trophy.

The 200 guinea International Trophy, which was won by the English team in the A.C.U. Six Days Trials by defeating the French team, is now on exhibition in Gloucester at the premises of Messrs. Gibb, Gough and Sons, of 26, London Road.

Remarkable—Nobody Killed !

Under the above heading an American contemporary publishes a paragraph relating to a well-known saucer racing track, and says, "The —— track has a remarkable record, in that it has not been marked with an accident, either to riders or spectators, that approached a serious nature."

A.A. and M.U. Notes.

THE LONDON - PORTSMOUTH ROAD. — Those A.A. and M.U. members who have sent in complaints to the Association regarding the unsatisfactory condition of portions of the London-Portsmouth Road will be glad to hear that the local authorities controlling the Petersfield-Portsmouth section are about to spend a large amount in converting the surface into granite in place of the flint and gravel now used.

An Adventurous Sidecar Trip.

A remarkable journey by motor cycle and sidecar has just been accomplished in America, where Mr. and Mrs. Le Roy Snodgrass, of Long Beach, California, have succeeded in crossing the Continent from their home to New York on a four-cylinder Henderson and sidecar. They carried a complete camping outfit, and naturally a good deal of their journey was through very wild and desolate country, especially out West. Specially strong wheels were provided, but otherwise there was nothing very special in the machine. Four months were spent on the trip, the running distance being 5,600 miles. It is interesting to note that 187 gallons of petrol and 14 gallons of oil were used on the journey

The Brooklands Meeting on Saturday.

At the Brooklands meeting on Saturday several new machines will make their appearance, one a twin-cylinder New Imperial to be ridden by E. L. Buchanan. A 3½ h.p. single-cylinder Humber new to track work will be handled by S. Wright, and it is said to be capable of nearly 70 m.p.h. Edmond will bestride his fleet little twin. No fewer than six Singers are entered and five Rudges. A machine which will be watched with particular interest is the A.B.C., which has a new jockey in J. L. E. Emerson, the old Norton exponent. A little Minerva will also try its luck from a limit mark. D. C. Bolton is riding his latest mount—a Douglas—and D. R. O'Donovan (Norton) is training very seriously for the event.

A list of entries follows :

FUTURE EVENTS.

Oct.	4.	—Sutton Coldfield & Mid-Warwickshire A.C. Open Trial.
,,	4.	—B.A.R.C. Brooklands Meeting.
,,	4.	—Bristol M.C.C. Open Speed Trials.
,,	11.	—Coventry & Warwickshire M.C. Annual Open Hill-climb.
,,	11.	—B.M.C.R.C. Meeting and A.C.U. Championships.
,,	25.	—Mersey M.C. Open Trial.
,,	29.	—A.C.U. Open One Day Trial for Cycle Cars.
Nov.	24 to 29.	—Motor Cycle & Cycle Car Show at Olympia.

The 17th Short Motor Cycle Race (a handicap, about 5¼ miles). Prizes £10, £5, and £3, or cups at option. For all classes of motor bicycles.

	Bore and Stroke.
P. Fletcher (Indian 1 cyl.)	82½ × 93

S. Wright (Humber 1)	84 × 90
F. G. Edmond (Humber 2)	60¾ × 60

The above racing model Williamson has just been supplied to an Italian motor cyclist—F.V. Lantranchi of Milan.

The Inter-club Hill-climb at Arms Hill.

"ARMA virumque cano"—"I sing of arms and the man." So wrote Virgil in the first book of the Aeneid; and so write we of Arms (sometimes called Alms Hill) and the men who climbed last Saturday. We have no little affection for this short sharp hill on the slopes of the lovely Chilterns, as *The Motor Cycle* "discovered" it and wrote it up in February last year. It was a perfect afternoon, more like summer than autumn, and the hill was in excellent condition. Excellent for Arms that is to say, as it has a permanently abnormal surface which, being chalk, is unrideable in wet weather. Just at the steepest part, which is said to be 1 in 3, are two iron drain pipes, one each side of the road, which are called "the cannons," and just below this point the surface is almost dangerously loose.

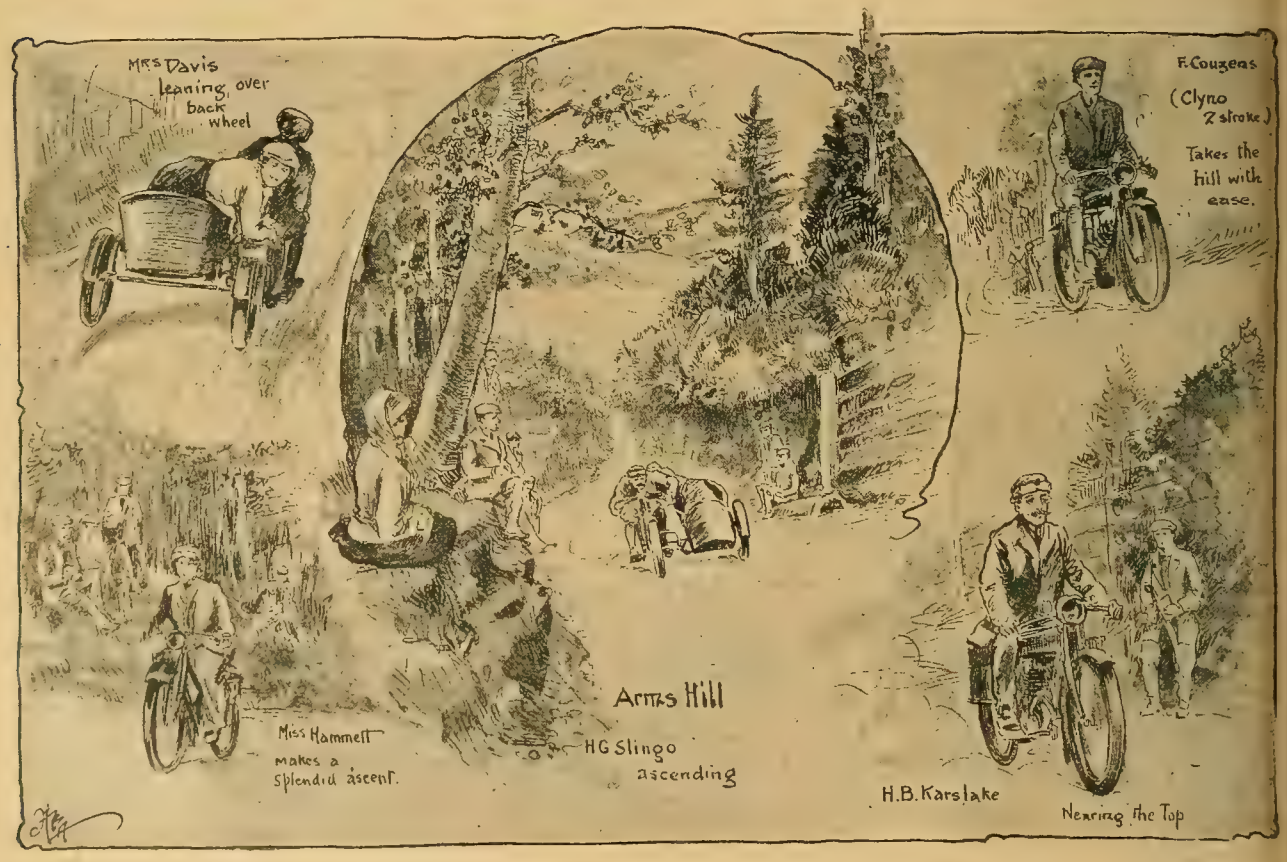
A Late Start.

The hill-climb was advertised to start at 3 p.m., but the event did not begin till 1 hour 45 minutes after this time. One team, the North-west London M.C.C., failed to turn up altogether, and of the two teams left that of the Oxford M.C.C. was composed of eleven men and that of the Middlesex M.C.C. of thirteen men. No times were taken, as the hill was considered too dangerous for a speed climb, but the contest was arranged in the following manner: Observers with flags were placed at four points on the hill, and marks were awarded as follows—up to the first flag 25 marks, up to the second 50 marks, up to the third 75 marks, and up to the last flag 100 marks. The results were based on the ten best scores of each club added together, and of these three had to be single-cylinder solo machines, one solo machine single-speed, three multi-speed solo machines (single or multi-cylinder), and one passenger machine or cycle car. On Saturday not a single cycle car entered the competition. It is a pity that the event was not better organised. No one had number plates, and even the observers did not know the names of the competitors. There was no programme, and the whole event was unbusinesslike. The best feature of the proceedings was the arrangement that no competitor was allowed to descend the hill, as each man had to return to the start by another route, but one man who ignored this regulation and might have caused serious trouble was allowed to get off scot free.

The Climb.

However, Mr. R. C. Davis, of the Oxford team, did his best, and is to be congratulated on giving the press all the assistance in his power. The first man up the hill was Davis on his 1914 Clyno sc. This machine has the cylinder radiating fins cast pear-shaped, larger valves, and a lower compression than last year. He made an excellent ascent, but his passenger, like others in this competition, was seated in an abnormal position. Slingo (Oxford), on a 1913 Clyno sc., also came up well. Gray, 6 Rudge sc. (Middlesex), failed the first time at the lowest flag, and the second time below "the cannons." W. Brown, who was driving a 6 Zenith fitted with the water-cooled valve caps described in a recent issue, for the Middlesex Club, came up in excellent form. Couzens (Oxford), on the new 2½ Clyno two-stroke, made a clean but slow ascent, which was much admired and no mean performance for so small a machine. Another good climb was made by yet another two-stroke, the 2¾ Stuart, ridden by Plint, also for the Oxford Club. H. G. Hill made a good climb for the Middlesex Club on his 2½ single-speed Calcott, but failed on the crest through belt slip. The Douglases ridden by Fletcher, Miss Hammett, Hilger, and Dangerfield for the Middlesex Club, and Eastwood for the Oxford Club, performed well, but Bocock (Middlesex) failed. Mills, Zenith-Green (Middlesex), failed on the summit through belt slip. Brown (Zenith) made a very fast climb solo, but had a terrific skid just short of the last flag. His machine pirouetted in the most extraordinary manner on the ground, but he cleverly extricated himself.

T. A. Brown, 3½ T.T. Triumph, single-gear (Middlesex), probably made the fastest ascent. Karslake's Rover



Mrs Davis leaning over back wheel
F. Couzens (Clyno 2 stroke) Takes the hill with ease.
Arms Hill
Miss Hammett makes a splendid ascent.
HG Slingo ascending
H.B. Karslake Nearing the Top

The Inter-club Hill-climb at Arms Hill.—

(Middlesex) made many excellent ascents both during and before the competition. There were numerous failures, of which quite a large percentage were due to belt slip. Most of the machines had ample engine power for the gradient, and next to belt slip most of the remainder of the failures were due to skidding on the loose surface. The results were as follows. The Middlesex Club won by twenty-five marks, the performances of its teams being as follows :

FIRST THREE SINGLE-CYLINDER SINGLE-GEARED SOLO MACHINES.

Rider and machine.	Marks.
T. A. S. Brown (3½ T.T. Triumph)	100
J. Lloyd (3½ Rudge)	100
M. G. Abraham (3½ Ivy-Precision) failed first flag	25

FIRST THREE MULTI-SPEED SOLO MACHINES.

J. A. Hilger (2¾ Douglas)	100
P. Dangerfield (2¾ Douglas)	100
H. Karslake (3½ Rover)	100

PASSENGER CLASS.

W. W. Brown (6 Zenith sc.)	100

NEXT BEST THREE MULTI-SPEED SOLO MACHINES.

Miss Hammett (2¾ Douglas)	100
W. L. Smith (3½ Premier)	100
G. T. Gray (6 Rudge)	100
Total	925

Also scored :

G. L. Fletcher (2¾ Douglas)	100
H. C. Mills (3½ Zenith-Green)	50
W. W. Brown (6 Zenith)	50
R. D. Bennett (3½ T.T. Triumph)	25

OXFORD M.C.C.

FIRST THREE SINGLE-CYLINDER SINGLE GEARED SOLO MACHINES.

Rider and machine.	marks.
A. F. Plint (2½ Stuart two-stroke)	100
H. G. Hill (2½ Calcott)	50
W. A. Matthews (3½ Triumph) failed above "Cannons."	50

FIRST THREE MULTI-SPEED SOLO MACHINES.

V. Couzens (2½ Clyno two-stroke)	100
H. R. Annis (3½ New Hudson)	100
L. Eastwood (2¾ Douglas)	100

PASSENGER CLASS.

R. C. Davis (5-6 Clyno sc.)	100

NEXT BEST THREE MULTI-SPEED SOLO MACHINES.

R. C. Davis (5-6 Clyno)	100
H. G. R. Slingo (5-6 Clyno)	100
A. James (6 Zenith)	100
Total	900

Also scored :

H. G. R. Slingo (5-6 Clyno solo)	100
T. G. Hill (4¼ James)	50

A Yorkshire Trial for B.S.A. Riders.

Originally intended to be a pleasure jaunt, the trial for B.S.A. machines with sidecars, promoted by Messrs. Armitage and Sons, York Street, Leeds, and held last week-end over an eighty mile course from Leeds to Scarborough, turned out eventually to be quite a serious reliability trial. There were twenty-one entries. The route followed was the main road as far as Malton, and then after some miles the fun commenced. The road was rather hilly, difficult to follow, and included a few water splashes, one of which was situate at the foot of a bad hill and naturally caused some anxiety, although only one competitor failed, the reason being water in his carburetter.

Punctually to time the riders commenced to finish well to their schedule.

After the competitors had been checked in at the second milepost from Scarborough a move was made to the Balmoral Hotel, where over sixty competitors, passengers, and officials sat down to lunch, after which the prizes were distributed as follows :

	Rider.	Marks lost
1.	F. Kilburn	13
2.	C. Clayton	14
3.	H. Fryer	17
4.	H. Noble	18
5.	J. Bader	20

The "hard lines" prize to the rider arriving nearest to thirty minutes after his schedule time was awarded to L. Buckton, and Mrs. Laycock gained the ladies' prize.

Competitors and officials in the B.S.A. Reliability Trial in Yorkshire last week-end.

HERTS M.C.C. FORTHCOMING SPEED TESTS.

The open flexibility and speed events will take place at Brookmans Park on the 25th inst.

The course is about four-fifths of a mile long. It will be divided into two equal sections, called the slow section and the fast section.

The slow section must be transversed at a given speed, according to the division. The rider in each class showing the greatest acceleration over this speed in the fast section to be declared the winner of that class.

Division A. (single-speed machines), 10 miles per hour.

Division B. (variably geared machines), 5 miles per hour.

Division C. (variably geared machines, amateurs), 8 miles per hour.

All competitors exceeding the time limit in the slow section will have the excess deducted from their time in the fast section.

There will be classes for machines of 350 c.c. and larger capacities as usual.

The Motor Cycle in the Army Manoeuvres.

MOTOR cyclists on manœuvres are attached to the Directing Staff, the Chief Umpire's Staff, the Signal Companies, the aeroplanes, and the Divisional Chief Umpires. Those doing duty with the Chief Umpire, Director, and aeroplanes usually live in hotels or standing camps in comfort, riding out and home each day. Those with the Signal Companies and Divisional Umpires bivouac with the units to which they are attached, and "doss down" with a ground sheet and blanket, as tents are not carried on active service. Their motor cycles also "sleep" unprotected in the open fields.

Those motor cyclists who were out during the divisional manœuvres will not soon forget the Friday night near Stukeley. It rained heavily all night; a start was made before the dawn, with everything and everyone dank, dirty, and dripping.

The Divisional Manœuvres came to an end on the Saturday morning, and bands played their regiments into the rest camps, where the luxury of sleeping in a tent was enjoyed by some.

Early on the Monday morning the Army exercise began, and consisted of moving two columns along two parallel roads *via* Leighton Buzzard and Towcester, until on the Wednesday the four divisions deployed for the attack, which concluded late on Thursday. All food and fodder was brought up from the railhead by means of mechanical transport, from which the horsed transport of the various units picked up their rations.

All despatch riders have their exciting moments and hair's breadth squeaks, so that it is more interesting to make a general review of the motor cyclists' work and how machines and traffic control have improved.

In 1910 the casualties amongst motor cyclists were enormous, dozens of machines being wrecked or put out of action. This was due to the difficulty of passing troops and trains on the roads. Things were better in 1911, and this year the manner in which way was made for despatch riders was just wonderful, the only troublesome people to pass being the regimental bands and the yeomanry. I award the palm for giving easy passage to the cavalry and artillery. It was thrilling meeting the heavy artillery once at the trot!

Reliability and Silence.

As an instance of the reliability of machines, there were nine of us working with the headquarters of the Third Division for ten days. Every one of the machines was in the open night and day, rain or shine, and yet after a night in the rain each machine fired promptly, and at the conclusion of manœuvres not a single machine had crocked, the average mileage being about 650. Naturally, there were bent footrests and damaged lamps, but what would one expect when one has so frequently to ride across fields and take to ditches and roadsides! There was quite a number of single-geared fixed engine machines out, but these were heavily handicapped when trying to pass troops and trains on narrow roads, when the gutters were thick with mud. Fortunately for the owners, hills were few. Tyres gave a good deal of trouble, due in most cases to gashes from bottles.

MOTOR CYCLISTS AND THE MILITARY MANŒUVRES.

(1) Invasion of Whatley by the White land force. Cambridge University Scouts attached to the Headquarters Staff. (2) A motor cyclist scout receiving instructions from an officer, near Towcester. (3) Priming the 80 h.p. Gnome engine of the Blackburn monoplane from the tank of a Blackburne motor bicycle.

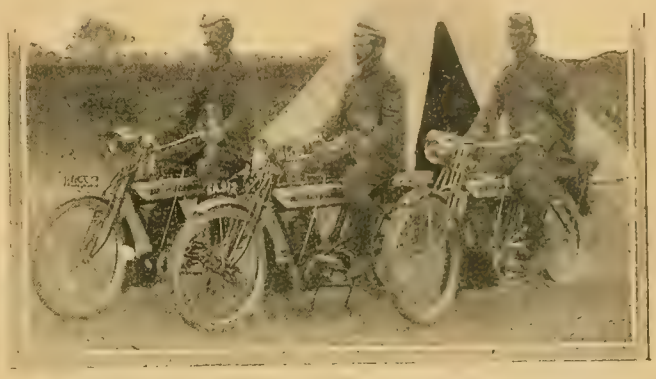
The Motor Cycle in the Army Manœuvres.—

It would be an excellent thing if motor cyclists on manœuvres would try to render their machines as *noiseless* as possible, instead of removing silencer ends and opening cut-outs, as so many of them do. Tired men, marching long distances, become irritated by the ceaseless string of barking motor cycles brushing past, and their nerves get on edge.

A Compliment to the Motor Cycle.

Officers and men seem to think (and it is a compliment) that a motor cycle can go through any block, over any surface, in any weather, when really an aeroplane would be the only suitable vehicle. These manœuvres are the third in which I have served as a motor cyclist, and they have easily been the most strenuous owing to the fact that I was the only motor cyclist serving with the umpires of my division, and this caused me to be never off duty; in fact, I did not even remove my boots for five days. My most unpleasant experience was meeting and passing the mechanical transport of the Second Brown Army at night on a narrow greasy road near Leighton Buzzard, blinded by the continuous stream of powerful headlights. The Army rations (active service) consisted of "dixie" tea and bread and butter for breakfast. Biscuits and cheese in haversack (sometimes). Bread and butter and tea (sometimes bully beef) for supper. The one good meal was dinner in the rest camp on the Sunday after Divisional Manœuvres, viz. stewed beef, peas and potatoes.

Many of the officers I came in contact with were motor cyclists, but all of them said they had more respect for their machines than to bring them out on manœuvres. It is left for enthusiasts like the readers of *The Motor Cycle* to fill the breach, and here I find myself, tired and sleepy, yet looking forward, all being well, to next year's Army work. MERCURY.



Sergeant Smith, Corporal Armstrong, and Corporal Robinson of the London Cyclist Corps on manœuvres. All are riders of Zenith-Gradua machines.

BIRMINGHAM-CARLISLE-BIRMINGHAM.

Open 24 Hours' Trial of the Birmingham M.C.C.

The official awards in connection with the above run, a report of which appeared last week are as follow: H. Ball (Triumph), F. E. Baker trophy and gold medal for best solo performance; W. H. Egginton (Enfield sc.), L.M.C. watch and gold medal for best passenger performance; team prize, value £3 3s., the Rover team (R. W. Duke, D. M. Brown, and G. N. Ratcliffe).

GOLD MEDAL WINNERS.

E. Walker (Monarch sc.)
T. Stevens (James sc.)
F. J. Chidley (Triumph)
A. G. Cocks (Connaught)
S. A. Rowlandson (Rudge)
R. W. Duke (Rover)
A. G. Clease (Rudge)
A. N. Barrett (Rudge)
E. H. Littledale (Ariel)
T. A. Biggs (Rudge)
D. M. Brown (Rover)
H. Berwick (Hampton)
H. G. Dixon (James)
S. C. Perryman (Quadrant)
L. L. Sealey (B.S.A.)
G. Nott (Clyno sc.)
J. D. Drysdale (Hazlewood)
W. H. Bedford (Hazlewood)
M. L. Riley (Enfield sc.)
A. H. Johnson (Alldays sc.)
H. Hopkins (Abingdon King Dick)
S. Tharp (Triumph)
L. Newey (Ariel)
H. R. Davies (Diamond)
A. H. Mee (Diamond)
A. Milner (Levis)
E. Gutgemann (Veloce)
G. N. Ratcliffe (Rover)
A. W. Sarsons (Sun-Villiers)

SILVER MEDAL WINNERS.

F. E. Farmer (Ivy-Precision)
J. Huntingdon (Triumph)
S. Wright (Humberette)

BRONZE MEDAL WINNERS.

F. T. Hill (Triumph)
H. G. Liefeldt (Rudge)
K. K. Scheve (Rudge)
T. Pollock (James)
J. Drew (Enfield sc.)
T. F. Blumfield (King Dick)

With the results an official announcement states that owing to the method of timing (by competitor's own watch and checkers' synchronised watches) having confused some of the checkers, those checks about which there was the slightest doubt as to the accuracy or otherwise of the times taken have been ignored. The only checks considered were Kendal (both journeys), Shap (outwards only), and the finish. Carlisle was taken as an untimed control only.

REMARKABLE RESULTS OF A PETROL CONSUMPTION TEST.

Sutton Coldfield and Mid-Warwickshire A.C. Trial.

The annual petrol consumption trial was held on Saturday last, the 27th ult., over a course twenty-three miles long, which included three steep hills. Fifteen started, and the winner's mileage caused quite a sensation when announced at tea, which was taken at the Royal Hotel, Sutton Coldfield, the club's headquarters. The results are as follows on formula:

		m.p.g.
1.	T. Pollock (3½ twin James)	334
2.	H. G. Dixon (3½ twin James)	320
3.	S. A. Rowlandson (3½ Rudge)	187
4.	H. E. Perry (3½ Ixion)	110
5.	H. E. Lane (2¾ N.V.)	192
6.	A. Butterfield (2¾ Levis)	192
7.	J. St. John (2¾ Levis)	160

The Levis machines were fitted with 1914 Binks carburetters, and, considering they were only fitted the day of the trial, the mileage was very good.

The sidecar and cycle car result was:

		m.p.g.
1.	Howard Smith (10 Singer)	87
2.	P. W. Hill (5-6 A.C.)	101
3.	R. W. Lovegrove (7 Indian sc.)	87
4.	Mrs. Riley (6 Enfield sc.)	75½
5.	J. H. Brown (6 Rex sc.)	67

SATURDAY'S OPEN TRIAL IN THE MIDLANDS.

There are over eighty entries up to date for the open trial on October 4th, including the following teams: Matchless, Scott, Sunbeam, James, Blackburn, Quadrant, Ariel, Enfield, Rudge, Clyno, and South Birmingham M.C.C. The start will be from the quadrangle of the Midland Wheel Club, Paradise Street. Route: Worcester, Ankerdine Hill, Martley, Abberley Hill, Ludlow (lunch), Whitback Hill (flexibility climb), Norton, Farlow Bank, and finish at club house. By the kindness of the Midland Wheel Club all competitors and officials will be made members of the club for the day.

The course measures 125 miles, and the first man will be started at 8 a.m., and is due back at 4.15 p.m.

CLUB NEWS.

Oxford M.C.C.

A members' hill-climb will be held to-day (Thursday) at 3.30 p.m. at Blowing Stone Hill, Kingston Lisle, near Wantage. There will be four classes.

Colchester and District M.C.C.

A reliability trial was held on the 25th ult. for a cup presented by the borough member (Mr. L. Worthington Evans). Result:

	Rider and machine.	Marks.
1.	T. S. Wilkin (3½ T.T. Rudge)	325
2.	F. E. N. Crosby (3½ Swift)	318
3.	C. L. Gray (3½ T.T. Triumph)	312

Each rider was credited with 400 marks at starting, points being deducted for errors in time of arrival at various checks, of which there were ten, in the course of eighty-six miles.

Walthamstow M.C.C.

The annual speed trials were held last week over a course of sixteen miles, including one turn. The weather was rather misty, which made driving at high speeds tricky. The results on handicap were:

	Rider and machine.	Speed.
1.	G. Bax (3½ Scott)	50½ m.p.h.
2.	J. H. Kerr (3½ N.S.U.)	47 ,,
3.	A. G. Peppercorn (10 Wasp c.c.) ...	36½ ,,

The W. S. Low Cup competition will be held on October 5th over a sporting course of 150 miles in Essex, including several steep hills and hairpin bends.

Middlesex M.C.C.

The annual speed-judging was run off last week-end, and proved a most enjoyable event. The course was of three-tenths of a mile, mainly up hill, and three runs were given—at 14½ m.p.h., 19 m.p.h., and 25½ m.p.h. respectively. The timing was in the hands of H. Karslake, and the results were announced within a few minutes of the finish. They were as follows:

	Rider and machine.	Total error.
1.	Miss May Walker (2¾ Hobart)	10⅗s.
2.	S. A. McCarthy (8 Sabella c.c.)	12s.
3.	A. E. Lloyd (3½ Triumph)	13⅗s.
	H. J. Martin (3½ Rover sc.)...	15⅘s.
	P. Dangerfield (2¾ Douglas)...	16⅗s.
	Miss R. Hammett (2¾ Douglas)	17s.
	H. Boocock (2¾ Douglas)	17⅘s.
	J. A. Hilger (2¾ Douglas)	19⅖s.
	T. J. Heavey (3½ Veriot-Jap)	25⅗s.

By special request the run next Saturday will be to Broxbourne, leaving headquarters at 3 p.m. The route taken will be *viâ* Potter's Bar and Goff's Oak.

Kingston-on-Thames and District M.C.C.

The trial over 100 miles course for the Butler Cup resulted as follows: 1, D. W. Morgan (3½ Rover); 2, F. Woombell (3½ Triumph); 3, F. Dawson (7 Foster-Dawson sc.)

Manchester M.C.C.

The results of the members' hill-climb at Axe Edge, Buxton, on September 20th, were as follows. This was the last event of the year:

Solo Class.—1, F. Knight (3½ Bradbury); 2, H. J. Scale (3½ Scale-Jap) fastest time of the day.

Sidecars and Cycle Cars.—1, G. F. Robson (8 G.W.K.); 2, J. Eastwood (3½ Bradbury sc.)

Motor Cycling Club.

The closing run will take place on October 19th to Burford Bridge. Lunch at 1.30.

The winter run will be held on December 26th and 27th this year, and a committee meeting will be held on December 8th to pass the entries, after which none can be received. All application forms from prospective members, together with their entry forms, must be in the hands of the hon. sec. by the 1st of December.

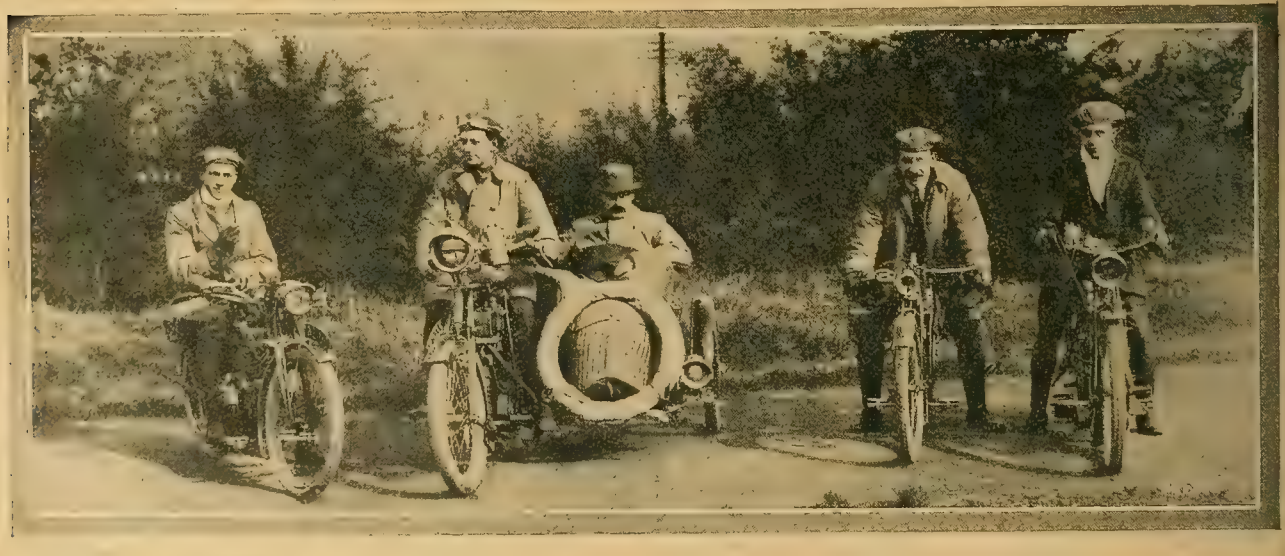
Ipswich and District M.C.C.

On Saturday last an inter-club reliability team trial was held between the Ipswich and District M.C.C. and the Bury and West Suffolk M.C.C. The start was at Stowmarket, and the competitors then proceeded to Thetford *viâ* Bury, where the first stop was made. At this check there was very little difference between the competitors' and the schedule time. The piloting through Thetford was arranged by Mr. J. G. Brown, who enlisted the aid of the Thetford Boy Scouts. After leaving Thetford the members made for Norwich, where the next check was placed, this being practically half-way round the course. After signing the check sheet the competitors made for the Great White Horse Hotel, Ipswich, for tea. The winners were:

		Marks lost.
	V. C. Cook, Ipswich (3½ Rover sc.)	1
	J. H. Marshall, Bury (3½ Bradbury)	3
	Val. Revitt, Ipswich (3½ Rudge)	3
	A. A. Scott, Ipswich (3½ Bradbury)	4
	F. Z. S. Pettitt, Bury (3½ Premier)	4
	E. Scott, Ipswich (2¾ Douglas)	4
	A. J. Simpson, Ipswich (7 Indian)	4
	J. F. Nunn, Bury (2¾ Douglas)	4

Ipswich thus won the trial.

The Ipswich and District M.C.C. hold their closing run on Saturday, October 11th, starting from the Great White Horse Hotel, Ipswich, at two o'clock prompt.



WINNING TEAM IN THE SHEFFIELD AND HALLAMSHIRE M.C.C. TEAM TRIAL OF 80 MILES.

Left to right—E. Thompson (2¾ h.p. Douglas), J. H. Haigh (6 h.p. Enfield sidecar), J. A. Stacey (2¾ h.p. Douglas), and A. Boyd (3½ h.p. Rudge).

Club News.—

Ipswich and District M.C.C.

On September 20th the Ipswich and District Motor Cycle Club held their third club run. The weather was unsettled, and prevented many from taking part. After travelling some distance three competitions were held, the winner of the three being R. Fenn on a 3½ Triumph. The second position in these events was taken by D. W. Popplewell.

Inter-county Hill-climb at Warnell Fell.

The Westmorland and Cumberland M.C.C.'s held a joint hill-climb at Warnell Fell on September 18th. This hill, it will be remembered, was chosen for the flexibility test in the recent Six Days Trial. From base to summit the distance is about 100 yards short of a mile. The surface was in fairly good condition. The best time of the day, 1m. 1s., was done by B. Jeffreys in the 1,000 c.c. class on formula.

TIME RESULTS.

CLASS 350 C.C.

Rider and machine.	m.	s.
H. A. Rhodes (2¾ A.J.S.)	1	37⅕
P. M. Gilbanks (2¾ Douglas)	1	37
S. Barrow (2¾ Humber)	1	42⅖

CLASS 500 C.C.

E. F. Gilbanks (3½ Rover)	1	5⅗
G. W. Braithwaite (3½ Zenith)...	1	12⅕
J. Braithwaite (3½ Braithwaite)	1	15⅗

CLASS 750 C.C.

E. F. Gilbanks (3½ Rover)	1	5⅖
G. W. Braithwaite (5-6 Rudge)...	1	14⅘
P. N. Gilbanks (3½ Triumph)	1	24⅖

CLASS 1,000 C.C.

B. Jeffreys (8 Zenith)	1	2
E. F. Gilbanks (3½ Rover)	1	5⅖
G. B. Biglands (6 Zenith)	1	12

FORMULA RESULTS.

Class 350 c.c.—1, H. A. Rhodes; 2, P. N. Gilbanks; 3, G. Rutherford.

Class 500 c.c.—1, E. F. Gilbanks; 2, J. Braithwaite; 3, E. T. Scott.

Class 750 c.c.—1, G. W. Braithwaite; 2, R. Drinkall.

Class 1,000 c.c.—1, B. Jeffreys; 2, G. B. Biglands.

Sidecar Class.—1, Miss Biglands; 2, R. L. Williamson; 3, E. Burras.

East Essex M.C.C.

The above club are holding a petrol consumption test on Saturday next, from Colchester to Chelmsford, starting at three o'clock.

Bristol B. and M.C.

This club held its fifth reliability trial over a secret circular course of twenty miles. The course had to be ridden three times, each circuit being non-stop, with time check at the end, and one secret check per circuit. The route cards being handed out, the competitors found the course included three exceedingly stiff hills, and ran over twisty country lanes so that to keep up the schedule speed of 20 m.p.h. was no light task, yet eight completed the trial without stop, and the greatest total time error on the six checks was six minutes. So close was the riding that only four seconds divided the first two men. Results:

Rider and machine.	Total time error
1. H. A. Pritchard (3½ Triumph)	84s.
2. A. S. Richards (2¾ A.J.S.)	88s.
3. Eric Butler (2¾ Humber)	145s.
4. E. H. Staples (2½ A.J.S.)	181s.
5. W. H. Goodenough (6 A.J.S. and sc.) ...	201s.

H. A. Pritchard wins the silver cup presented by the Motor Cycle Manufacturers' Union, and A. S. Richards the first club prize, with E. Butler as second, and E. H. Staples as third.

Public Schools M.C.C.

The Public Schools M.C.C. held another of their sporting week-ends recently, meeting at Purley Corner, thence running down to see their team compete in the Streatham and District M.C.C. speed trials. After the racing seven members left the Old Ship, Brighton, at four o'clock for New Romney, and gradually, owing to various causes, shed the slower members of the party, who were, however, enabled to catch up again, owing to the two leaders having such vicissitudes as finding themselves in a coal yard in Hastings instead of on the road to Winchelsea; also going some four miles out of the way and having to return. Browning (Indian) reports that he chased Max Cremetti (Trump-Jap) for four miles to tell him they were on the wrong road before he could catch him. About eight o'clock the party arrived at New Romney, where they had dinner.

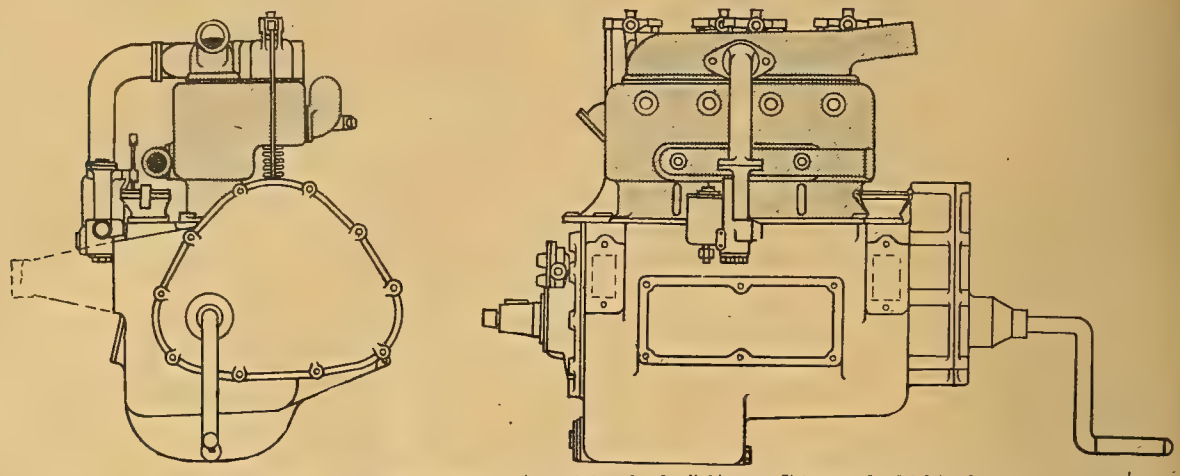
Next day the club set out for Maidstone for lunch, which was reached after a glorious run, in which Keller's Triumph distinguished itself by keeping up with Getting's big Bat and Browning's 7 T.T. Indian. After lunch a run to Sevenoaks, whence the majority returned to London, ended a most amusing and sporting week-end.

Next year it is to be hoped that the little red flag will be seen in increasing numbers.

The club is run on the most thoroughly sporting lines, and there is great *bon camaraderie* among all the members.

The above photographs have been received from an Italian tourist, Robert Bertolotti, and depict the Schlunderbach Pass being climbed by a 3½ h.p. Triumph on the way to the Ursurina Pass, Tyrol. This is believed to be the first ascent of this pass on a motor cycle.

Blumfield Four-cylinder Light Car Engine.



The latest design four-cylinder Blumfield water-cooled engine for light cars. It has overhead inlet valves.

ON August 7th last we briefly referred to the fact that Messrs. Blumfield, Ltd., were about to market a four-cylinder water-cooled engine for small cars and cycle cars. We are now in a position to give detailed particulars of this engine, which is well and substantially built, and for which a brake horse-power of 19.15 h.p. is claimed when running at 2,300 r.p.m. The normal crankshaft speed is 1,750, at which rate of revolutions 9 to 10 h.p. is obtained.

The four cylinders are cast together, and have a bore and stroke of 62 × 90 mm. = 1,088 c.c., the cylinders being offset five millimetres. The cooling is on the thermo-syphon principle. The pistons are fitted with two rings, and the gudgeon pins are a driving fit in the piston lugs, while a V slot cut in the gudgeon hole permits the insertion of a flat spring which prevents the pin from turning round or working loose. The connecting rods are of the usual H section steel; the big ends are lined with anti-friction metal which are provided with excellent bearing surfaces.

The valves, which are all on the near side, are of nickel steel, and the inlets are overhead, carried in a neat box to which is pivoted the valve rocker, the springs and guides being entirely enclosed and a lubricator is fitted to the rocker. The tappets are adjustable. The camshaft and magneto are silent chain-driven, one chain being used to drive both shafts, the chain being adjustable by an eccentric bearing on the magneto drive can be altered in tension in about two minutes without dismantling any parts.

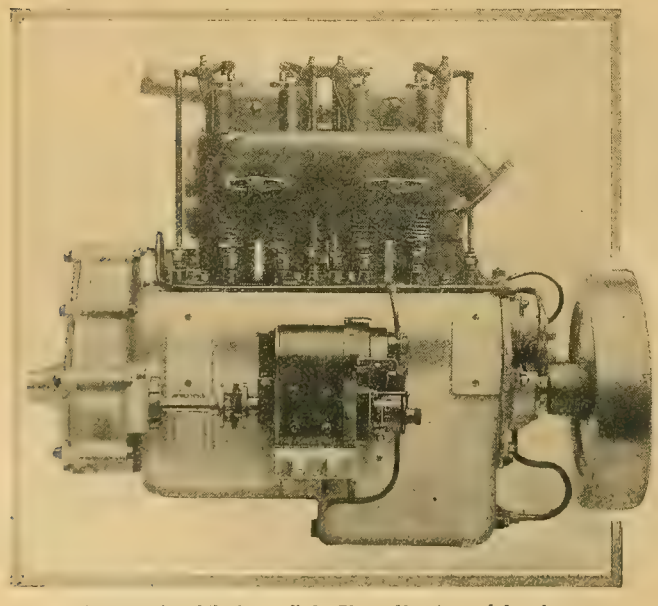
Extreme Accessibility.

One of the special features of this engine is the crank case, which is cast in one piece, only a small end being left open through which the shaft is passed into the case. The big end bearings can be taken up or the pistons and connecting rods withdrawn bodily through an inspection door without dismantling any other part of the engine—an admitted advantage over the horizontally divided chank case, where the bottom half must be removed to get at the big end bearings, etc.

The lubrication is by gear pump with forced feed to the main bearings and splash to big ends, pistons, and other parts. The big ends dip into troughs which are fed by a distributer pipe inside the crank case.

The weight of this engine, complete with flywheel, magneto, and carburetter, is 190 lbs. It is fed from a Zenith or S.U. carburetter attached to the off side, the gas passing through the induction pipe which is carried through the top water jacket and connected to the inlet valve box by a coned Dermatine ring.

The works management at Lower Essex Street, Birmingham, are always careful to see that engines develop on the brake test about double the nominal power at which they are listed, and we were present at the works last week when one of these engines was on test, when with 6in. × 7in. fan blades the speed attained was 2,150, which equals 17.41 b.h.p., while at 2,200 r.p.m. with the same fan blades the power given off was 18.65 h.p. An examination we made of a horse-power chart showed that with the large fan blades fitted in the seventh hole 23.2 h.p. was recorded. The price of the Blumfield four-cylinder engine with flywheel, magneto, and carburetter is £60.



Magneto side of the four-cylinder Blumfield water-cooled engine.

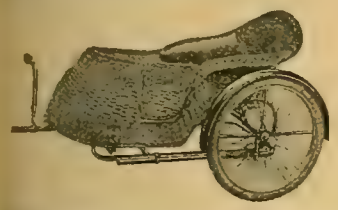
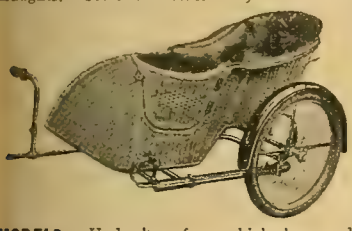
CORONET SIDE CARS

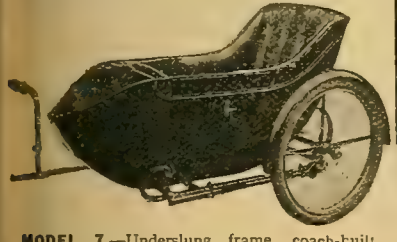
are correctly constructed to give the utmost satisfaction to users. The design is pleasing to the eye, and has no freakish look. Avoid risk of disappointment by specifying a Coronet, which are fully guaranteed and manufactured under the best possible conditions.



MODEL 9.—Underslung frame, body fitted with side door, sides and floor lined to exclude draughts. "Coronet" detachable joints. **£7 7s.**



MODEL8.—Underslung frame, high-class reed cane body, sides and floor lined to exclude draughts. "Coronet" detachable joints. **£8 17s. 6d.**



MODEL 7.—Underslung frame, coach-built body, tool-box under front, also under seat. A real high-class sidecar. **£10 15s.**

SENT CARRIAGE PAID.
TRADE SUPPLIED.

TEE BEE SEAT-PILLAR
(for lowering seat).
Price **5/-.**

This attachment is particularly suitable for improving the riding position of machines which are too high. It will be noticed that clearance is left for the peak of the saddle, which allows the saddle to be placed well forward.

(6 Days' World's Sidecar Record type)

The 1913½ big clutch type has been designed expressly for passenger work.

It solves all gear worries and guarantees you satisfaction.

The 1913 Roc gear was already recognised the last word in motor cycle gears for solo use.

The 1913½ big clutch type is just what thousands of "sidecarists" have awaited and expected.

The Roc gear was the first of all motor cycle gears—it is the first to-day. Nothing could be smoother, easier to operate, or be more reliable.

No better investment for the money is possible than in this 1913½ Roc dependable gear, fitted complete for ten guineas.

Write for particulars, stating make and h.p. of your machine.

No delay in delivery.

ESTABLISHED 20 YEARS IN THE HEART OF THE TRADE

How you can obtain

A NEW MOTOR CYCLE

FOR 6d. A DAY

Read every word and think over it.

The price at which we are offering the two or three high-class machines, specified below, is so exceptional that two or three buyers who are keen and quick after a bargain are offered a golden opportunity. (A perfectly new unused machine, mark you, soiled only.) The price is such that when the machine is disposed of next year, after having been ridden for a season, the figure realised will be so near to the original cost price, that the difference will not represent more than 6d. a day.

Work this out! Providing only that you buy right (and you could not go wrong on any of the machines below), it is possible for you to get one year's wear out of your machine for 6d. a day.

1 Shop soiled **Douglas R.**

2 Shop soiled **New Hudson**

2 Shop soiled **Matchless No. 8 h.p.**

Remember the above are just a few exceptional lines which have become a little soiled by standing in our show rooms. Possibly one or two of them may have been ridden a few miles by some prospective buyer, or perhaps become marked or scratched in transit. Nevertheless they are all absolutely as good as new for all practical purposes.

Now! All you who are interested send a postcard, mentioning which machine you think will suit you, or you have a particular *penchant* for, and we will at once get into touch with you by a call or letter. For a few machines in our stock we are open to discuss deferred payment terms with prospective buyers.

Colonial Prices.

WE publish a letter this week from a correspondent in New Zealand who puts forward in a concise way a matter which affects motor cyclists across the seas in a very vital manner, and in a very vital spot—their pockets. He refers to the prices asked and obtained for English machines in our colonies. The instance he quotes is, we hardly think, an isolated case, judging from the frequency with which the matter is touched upon by many of our colonial correspondents.

The New Zealander in question asks, pertinently enough, why the retail price of a machine in the colonies should be any more than it is at home, plus the duty and freight. But in actual fact in the instance he gives, the price asked is some £13 in excess of this. Some of this must, of course, go toward the higher wages paid in a protectionist country, and the interest on the agent's money paid months in advance. It is a simple matter to arrive at the corresponding price in New Zealand to that obtaining in Great Britain. Assume a machine to cost £50 at home, the import duty on a British motor cycle is 20% *ad valorem*, or £10. To pack in case, dock dues, shipping and freights cost £3 3s., thus bringing the retail price of the machine landed in New Zealand to £63 3s., but £76 is the price the agent asks.

Now the agent gets his trading commission on the English price of £50, and even assuming that he has to put his orders through a shipping house in London, there is no reason why this should increase the retail cost by more than twenty shillings in New Zealand.

Therefore, it is pretty obvious that the lot of the colonial agent is exceedingly rosy when he is handling a free selling line of goods. No one can blame him for making hay while the sun shines, but it is for the manufacturer at home to consider whether this system of dealing is in the long run good for the home trade.

American competition is increasingly severe all the world over, particularly so in most of our colonies. To sell cheaply is the motto of the American manufacturer, and he is not as a rule likely to let such golden opportunities as this slip by, and if he drops his prices 10% below the corresponding price of the British manufacturer, as he easily can, by direct dealing with his customer, or at any rate by insisting upon a maximum price, as well as a minimum, being charged by his agent, he is going far to secure the bulk of the market.

The course which appears to us to be the most equitable would be for the manufacturers, after consultation with their colonial agents, to fix a settled selling price for their goods for each particular locality after taking into careful consideration cost of labour, establishment charges, etc., in those localities. By this means the buyer would be assured that the price he pays is the true one, instead of sometimes, as is now undoubtedly the case, a price which is flexible and decided upon by the seller on the spot.

The Modern Reliability Trial.

IS there a wrong idea abroad as to the organisation of reliability trials, we wonder, or do the different clubs who organise trials with freak hills included consider that their object is served if only a small minority succeed? We are again moved to draw attention to this subject by the recent trial of the Liverpool Club, included in which was a hill which unseated all but two competitors. Can it be truly said that the two machines which succeeded did so by any inherent advantage in design? We would not like to suggest that it was a matter of pure luck, because we have a great respect for the abilities of the two successful riders and their mounts.

Now it is almost as bad to arrange so easy a course that practically all obtain the maximum award as to weed nearly all out of the non-stop list, but we must confess to incline to the opinion that more care could be exercised in the choice of a route. It is all very well to take riders in ordinary sporting club events over side paths and by-lanes used only by farmers' carts: it may be all right to include a watersplash or two, and a boulder jumping section, but when it comes to a serious trial under trade support, the primary object of which is to demonstrate to the general public who read the description of the events, and the spectators who line the course, that motor cycles have reached a stage approaching perfection, then the freakish trial is quite out of place.

We hope these few remarks will have a sobering influence upon those who undertake the important duty of selecting a course for a reliability event; it is too serious to the trade to be treated so lightheartedly as it has been of late. Finally, the tendency to include unrideable hills has already to our knowledge disgusted a large section of the trade, and we can give this early hint that trade-supported events will not be so numerous next year.

The Power of Sidecar Combinations.

FOR all ordinary purposes a 3½ h.p. with two or three-speed gear is sufficient, provided, of course, the combination is used in only moderately hilly districts and is not overloaded. Moreover, the sidecar body should not be a heavy one. A wicker or cane body is infinitely more suitable than a heavy coach-built body. It is not only lighter—a good point when the power is limited—but is very much more comfortable.

Against cane and wicker sidecar bodies it may be said that they are hard to clean, and after a few weeks' use in dusty weather look very dirty, but one cannot do much to them except brush them down thoroughly with a stiff brush. A coach-built sidecar, even if covered with mud, can be swilled over with a hose in a very short time, and amply repays its owner for his trouble in cleaning it by looking like new. At the same time, it is necessary to clean up such a sidecar frequently or the varnish will soon deteriorate, and rain spots especially should be washed off with plenty of water.

The modern 3½ h.p. with belt drive and three-speed gear is ideal for use with a sidecar in the manner in which the sidecar was originally intended to be used, that is, as a passenger attachment. It is all right for touring if the weight of passengers and luggage is kept down and if single-figure gradients are avoided, but for serious touring in Scotland or the Lakes a totally different kind of machine is required. This is the more powerful 6 or 8 h.p. twin chain-driven machine, specially designed for permanent sidecar work and almost too heavy for solo riding. To this class belong such machines as the Clyno, Chater-Lea, Enfield, Indian, etc., many of which have special lugs brazed on to the frames for the sidecar fittings. These machines are capable of taking two people anywhere in the British Isles at a cost of upkeep considerably less than the smallest car.

MOTOR CYCLISTS AND THE ARMY.

The use of the motor cycle in the army is continually on the increase. The latest innovation is the addition of a motor cycle section to the 9th Hants Cyclist Battalion (Territorials). The photographs reproduced show the new section with their up-to-date mounts. A rifle is an unusual item in the equipment of a military motor cyclist.

Hub and Counter-shaft Gears.

I have received a long letter from Mr. E. C. Paskell, of the Armstrong Co., in which he makes a point of undeniable weight. "Two very powerful and influential companies," he says, "with plenty of money and splendidly equipped factories, have devoted all their energies to producing this type of gear, while the counter-shaft gear has only had divided attention at its back, owing to its being manufactured in factories devoted to other products." This one fact would suffice to account for the superior vogue of the hub gear, and suggests that for the last year or two the hub gear has appealed to both engineers and capitalists as the superior proposition. However, when projected into the future, this fact rebounds against the hub gear: for, despite the fact that counter-shaft gears are later in the field, and are produced under admittedly inferior conditions, they are already formidable rivals of the hubs. Personally, I would adventure the guess that when the counter-shaft gear really booms, the Armstrong and Sturmey factories will be making two of the best counter-shaft gears in the world. Mr. Paskell then repeats his challenge to me, and suggests that each of us should nominate a champion back wheel remover: that our champions shall be publicly timed at the Olympia Show, his representative being provided with an Armstrong geared machine, and mine with a T.T. The spectators shall be charged 6d., and the profits shall go to the trade benevolent fund. The sportsman latent in me nibbles at the bait, but I fear me that the 1914 Armstrong hub is going to be of a new patent drop-out variety. And I do not see why I should lose money over an innovation, the advent of which I have done something to foster. If there is to be no novel drop-out notion in the 1914 hubs, I am still "off" the challenge. Trained mechanics can effect miracles—did not a Michelin mechanic once fit and inflate a brand new 120 mm. cover in less than ten minutes? What I have clamoured for is a hub gear which the average amateur can remove in approximately the same time as a T.T. wheel. But I hope that drop-out three-speed hub is really on the *tapis*: if it is, the counter-shaft gear which is going to supplant it would have to be very very good. In the meantime, may I repeat one of my original queries—have the Armstrong and Sturmey-Archer people included a first rate light twin engine in their experiments with two-step drives and counter-shaft gears?

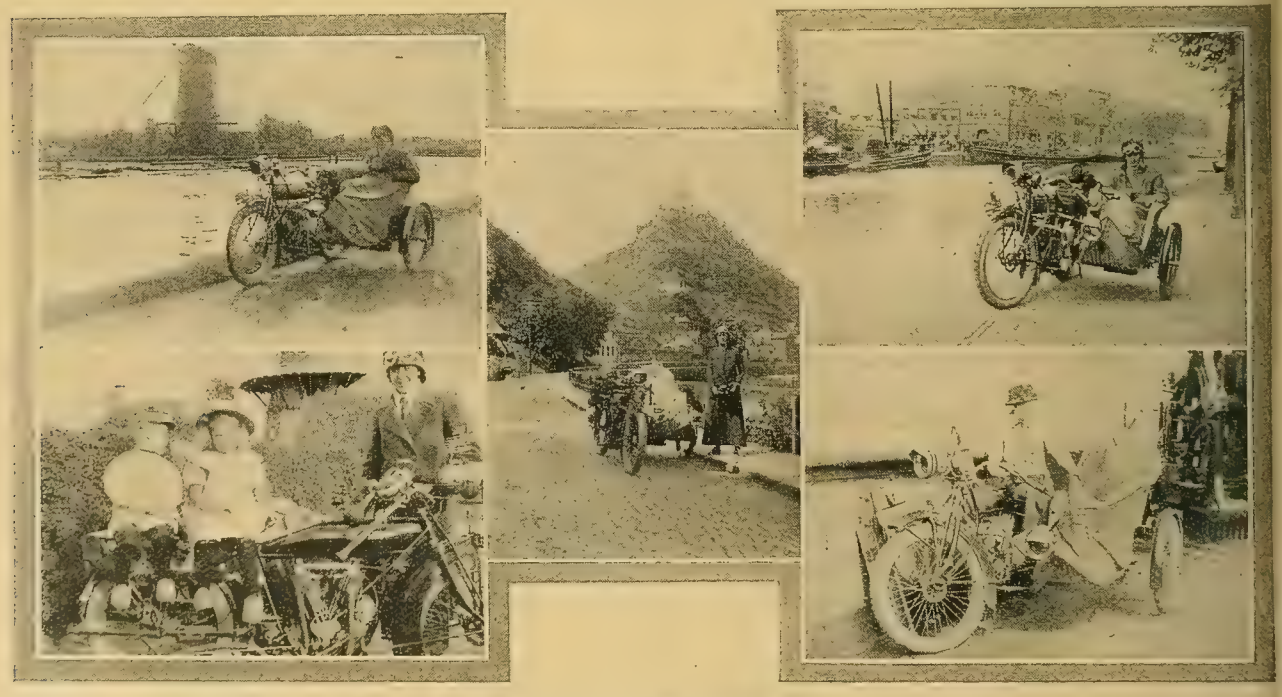
Mrs M. Smith, of Clapham, an enthusiastic driver of an A.C. Sociable

"Getting There."

I see Mr. D. K. Hall, the well-known timekeeper, objects to my dogma that the get-there type of rider must carry a spare inner tube, and gives very convincing experiences of his own for my refutation. His letter does not disprove a word of my contention, but indicates how carefully the premises should be defined at the commencement of an argument. Mr. Hall is not a fair test of my theory for two reasons: the one is that he does not compete in the mountainous trials which figure in the annual experience of every leading competition rider, and in the touring routes of a growing percentage of amateurs: the other is that he habitually uses tyres far more substantial and expensive than the average machine possesses. I believe I am right in saying that his back wheel is always decorated by a Kempshall non-skid. I use these tyres on my own mount, and though I have never got 6,000 miles (much less the 7,000 and 8,000 which he can claim) out of one of these covers, I must admit that in ordinary English touring work, I have never sustained such damage with one of them that a spare tube was needed to get me there. But, as Mr. Hall knows, few riders habitually fit such thick and costly covers, and at least once in each of the last eight years a spare tube has saved me a railway ticket when I have been out on thinner and cheaper tyres. Further than this, as soon as I go outside the normal South and Midland touring *régime*, I find that even the heavy and costly covers of which a Kempshall is a notable example fail to provide absolutely dependable insurance. In Wales and Scotland and the North of England, and in one instance down West, I have damaged inner tubes protected by Kempshalls to such an extent that a new tube was required to get me home. So I think I may fairly say that the really hard rider ought to carry a spare inner tube.

"Twin-Jap's" Problem.

The information given in "Twin-Jap's" letter in *The Motor Cycle* of September 25th is as meagre and vague as frequently happens when diagnoses per post are requested. He does not give his gear ratio, nor does he explain at all precisely what he means by saying that the engine will neither "climb" nor "pick up." But it is fairly evident, as the machine occasionally does 50 m.p.h. on the flat, that he cannot get a high rate of r.p.m. except under the most favourable circumstances. It would be helpful to know whether the engine is new or old, and whether it has ever behaved better than it is doing now or not. These details may help other worriers of our special medical department to frame their queries better. I was interested in his letter because I am similarly afflicted with an engine of quite another type. In my case there were three responsible causes. First, the gear ratio was a great deal too high. Second, all the moving parts of the engine were much too tight a fit. Third, the carburetter was fitted with so huge a choke tube that the engine could not suck out enough petrol at low engine speeds. These three defects are all common on newly delivered machines, especially if they are of the semi-racing type. Makers almost invariably fit high gear ratios, presumably because they feel bound to supply a full-length belt; new machines often come down with gears of 3½, 4, or 4¼ to 1, whereas most engines will run best on a gear of 5 or 5¼ or even 5½ until they have worked themselves loose and free. There are many engines, especially in the light twin class, which ought never to be geared more than 5 to 1 at the outside. I commented last week on the muscle-bound condition in which some makers deliver their engines—a foolish policy to my mind. A clever mechanic can soon make them "sloppy" enough to get high r.p.m., as the T.T. riders have to do in the Isle of Man; but the poor amateur duffer has no alternative but to ride them in a unroadworthy condition until all the parts are run in. Finally we touch on the amazing habit of delivering some machines intended for road work with a carburetter adjusted for Brooklands, and so huge an orifice round the jet that the engine cannot fire unless the unlucky owner is sprinting alongside at a speed which would break records if he could keep it up for 100 yards. As "Twin-Jap" has tried several carburetters (a wasteful plan, seeing that any good carburetter will give decent results if it is adjusted to suit its engine and the owner's particular needs), it is unlikely that carburation is the main cause of his trouble. But I suppose he realises that air leakages are perhaps the commonest cause of an engine refusing to rev. except under the most favourable circumstances. If an engine is being supplied with a weak mixture it can hardly be expected to bound away after a baulk, or to pull like a demon up Sutton Bank. These symptoms arise whenever the jet is too small, or the choke tube too large, or the inlet pipe is a loose fit on its stub, or if any other mode of permitting excessive air to penetrate the mixture is in existence; and the test is easy, for the engine should get away nicely if part of the fixed air intake is temporarily covered by the hand or a rag. Finally, we must not forget that some youthful enthusiasts expect to romp up Sutton Bank on a 500 c.c. engine in no special tune, geared 4 to 1, with about fifteen stone of dead weight on board.



WITH A SIDECAR IN HOLLAND.

The above reproductions are from photographs taken by Mr. W. B. Ellis, junr., Newcastle-on-Tyne, who has recently completed a tour on a 7 h.p. Indian and sidecar through Holland and part of the Moselle district. (1) In the canal district near the Zuyder Zee. (2) A view on the quay at Rotterdam. (3) A chateau on the banks of the Moselle. IMPROVED ROTHERHAM PILOT JET CARBURETTER.

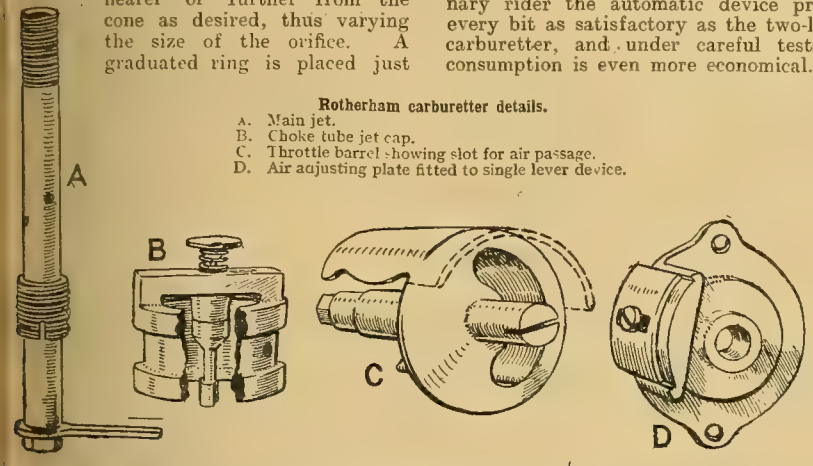
THE Rotherham pilot jet carburetter has undergone a few alterations in design, though the principle remains unaltered. The pilot jet lies on the engine side of the throttle, and is carried on a casting projecting from below the main jet, an air adjustment being provided by a sleeve which may be screwed up and down, thus varying the size of two air holes. The main jet A is screwed into the body of the carburetter and has a conical seating formed in its mouth. Into this seating fits the cone inside the choke tube B, which is loosely held in the casting by a spring, so that the cone may be easily centred, the projection below assisting it in this direction.

Petrol leaks below the jet are prevented by a small packing gland, and the main jet is provided with a lever by means of which it can be screwed nearer or further from the cone as desired, thus varying the size of the orifice. A graduated ring is placed just above the lever, so that the jet settings may be checked. The throttle is of the barrel type, and the air is of a similar type, lying at the side and opening a long slot (clearly visible in the sketch). The float chamber is on standard lines, and is fitted with a snap-on lid.

An Automatic Type.

A single-lever form of the same device will also be marketed, the only difference being that the throttle barrel is extended as shown by dotted lines C to cover the air port, and the plate D replaces the usual end cap on the air side. This cap carries a sliding plate by means of which the size of the air orifice may be varied, and once this is correctly set a movement of the throttle lever controls both the amount and quality of the mixture. Both throttle and air barrels are returned to the shut position by clock springs. We are told that in the hands of the ordinary rider the automatic device proves every bit as satisfactory as the two-lever carburetter, and under careful tests of consumption is even more economical.



Rotherham carburetter details.

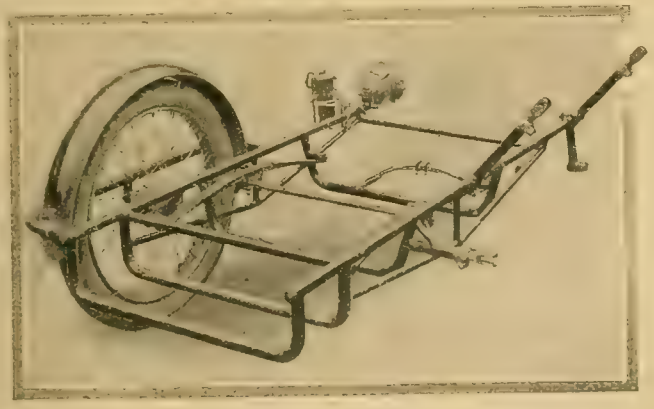
NEW PRECISION 500 c.c. TWIN.

A new model 500 c.c. twin Precision is about to be put on the market. The engine has a bore and stroke of 60×88 mm., and is fitted with side by side valves and a neat internal exhaust lift. In all details it follows the well-tried Precision lines, but a neat innovation is the flange joint for inlet and exhaust pipes, which are arranged in such a way that the cylinders are interchangeable. A feature for the next season will be the re-design of the water-cooled twin cycle car engine, which will have a bevel-driven magneto across the front of the engine.

The new Precision works at King's Norton are likely to be one of the finest engine plants in the country.

WILLIAMSON SIDECAR IMPROVEMENTS.

An illustration appears herewith of the 1914 Williamson sidecar chassis, the chief features of which are the four point fixings and the leaf spring suspension which provides most comfortable riding. The strong construction of the frame is visible at a glance A feature is the use of detachable wheels. The outside frame tube is fitted with a lamp bracket, a fitting which should be standard on all sidecars. The body is very roomy and comfortable. The Williamson Company have a most interesting collection of sidecar bodies, including a miniature three-seated cabriolet, which has frequently been seen in Coventry. A side-by-side two-seater body will probably be standardised for 1914. While at the works we noticed a forerunner of the next season motor cycle, which has several interesting experiments being tried out, including the kick-starter, which we illustrate. These ideas, however, have not yet been definitely adopted at present.

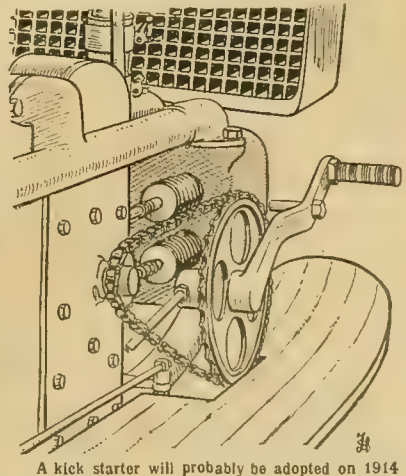


A strongly constructed Williamson sidecar chassis, which will be the standard Williamson frame for 1914.

It will be seen that the kick starter consists of a chain sprocket and foot starter fitted well to the front of the footboard; this is connected to a sprocket on the crankshaft, fitted internally with a free wheel. Further alterations on the new models will consist of neater pipe arrangements.

A.S.L. 1914 PROGRAMME.

Air Springs, Ltd., are not contemplating many alterations to their already well-known air sprung motor cycles. They will market the 3½ h.p. single-cylinder and the 5-6 h.p. twin, and will probably stage at Olympia a new twin of 3½ h.p. This will most likely be fitted with a twin Precision engine. The general construction remains unaltered.



A kick starter will probably be adopted on 1914 pattern Williamsons The first of the type is illustrated above.

Motor Cycle and Cycle Car Records at Brooklands.

564 Miles in Nine Hours.

THE 10 h.p. Singer cycle car went for records up to nine hours on 30th September. The car was driven by B. Haywood and G. Baker in turns, and they got among the records at 250 miles, which were covered in 3h. 58m. 37s. Thereafter the Singer ran with extraordinary regularity, an average speed of over sixty-two miles an hour being maintained right to the end of the nine hours. The actual distance covered in that time was 564 miles 1,524 yards, giving an average speed of 62.76 m.p.h.

The following table gives the new records set up by the Singer and shows very clearly the extreme evenness of running:

The Official Figures.

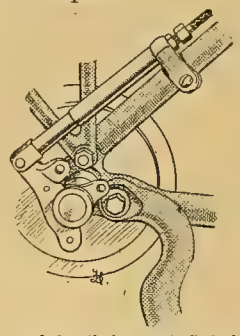
Miles.	Time. h. m. s.	Speed m.p.h.
250	3 58 37	62.86
300	4 45 50 3/5	62.97
350	5 38 3 4/5	62.11
400	6 24 32 2/5	62.41
450	7 13 48 3/5	62.24
500	7 56 50 4/5	62.91
550	8 46 19 4/5	62.70
Hours.	**m. yds.**	**m.p.h.**
4	251 813	62.86
5	315 282	63.03
6	373 621	62.22
7	438 1,384	62 68
8	502 1.353	62.85
9	564 1,524	62.76

The Speed of the Norton.

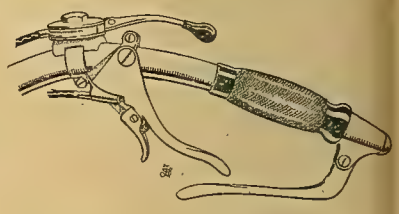
On September 30th, D. R. O'Donovan, riding a single-cylinder 3½ h.p. Norton (79 × 100 mm.), broke the five miles flying start and the ten miles standing start records in classes C and D.

In the five miles with flying start, O'Donovan covered the distance in 4m. 11 3/5s., which is equal to an average speed of 71.54 m.p.h., beating the previous best in both class C and D for motor cycles fitted with motors not exceeding 500 c.c. and 750 c.c. respectively. The previous records were held by G. E. Stanley on a 3½ h.p. Singer, who covered the distance at a speed of 70.75 m.p.h.

In the ten miles standing start, O'Donovan's time was 8m. 48 4/5s., equal to an average speed of 68.08 m.p.h.



HANDLEBAR CONTROLLED CLUTCHES.

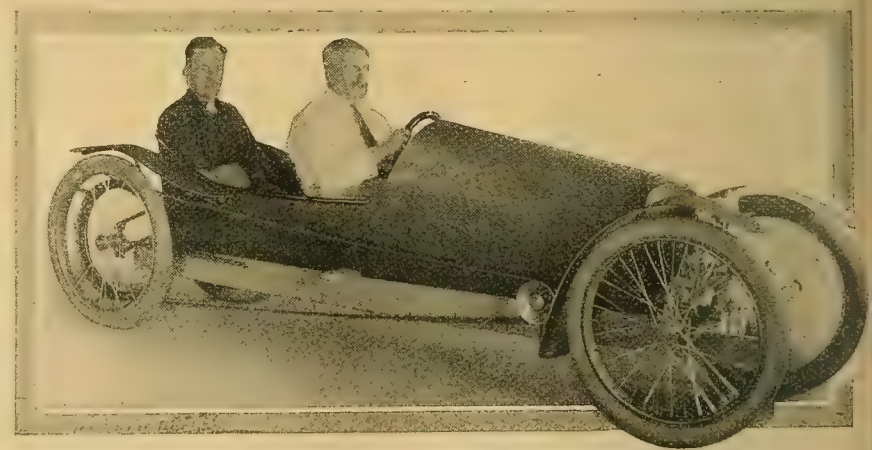


A handle-bar controlled clutch is fitted to the Sturmey-Archer gears on the Blackburne machines. The method of actuation is shown above; both handle and pedal control may be fitted if desired.

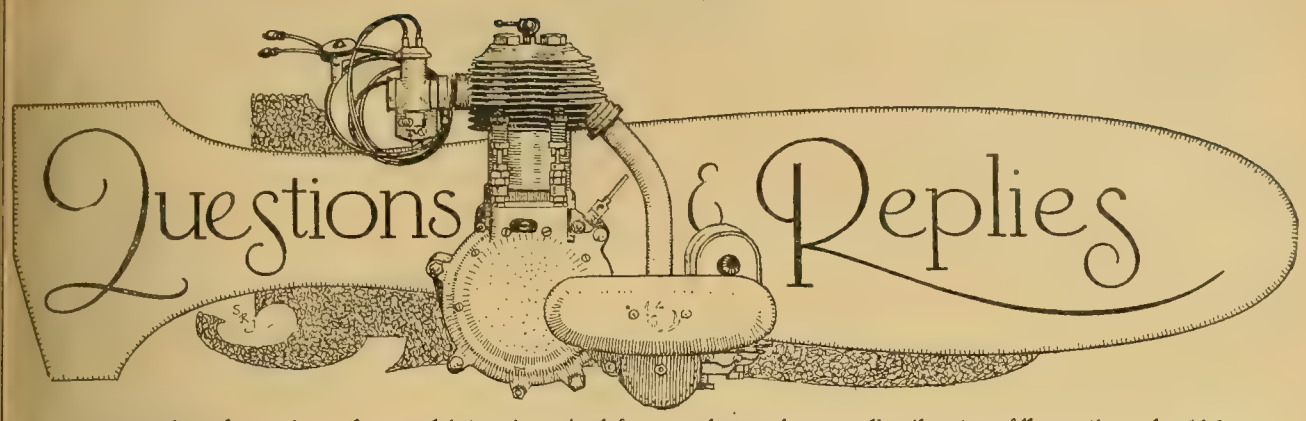
The Imp, an American Cycle Car.

THE Imp cycle car, which is made by the W. H. McIntyre Co., Auburn, Indiana, U.S.A., possesses a number of interesting details in construction, and is remarkable also for the moderate price asked for it, £75. The machine is built on the tandem-seated principle, and is fitted with a two-cylinder air-cooled motor of 10-12 h.p. nominal. The drive is by friction disc to a counter-shaft which is connected to the rear wheels by long side belts, much the same as on the racing Bedelia. Four forward speeds are provided, and the wheelbase is 8ft. 4in. A speed up to 50 m.p.h. is claimed, at which it is said that the little vehicle is perfectly steady and safe. The springing is highly reminiscent of the Cycar produced by Mr. Parnacott. One of the outstanding features is the provision of means for starting the engine from the driver's seat. The motor is started by turning a detachable handle which is inserted in the centre of the steering wheel. This crank connects with a shaft through the steering column with a ratchet on crankshaft through a gear spinning the motor three times faster than when turned by hand. Compression in the motor is automatically released when the crank is inserted and applied as soon as turning ceases. It is said that in starting it is simply necessary to turn the crank at the rate of 100 times per minute and then stop; the momentum attained by the crankshaft carries the motor over compression.

This is an undoubted advance in design provided it can be relied upon to work satisfactorily. It may be mentioned that there appears to be quite a rush in America to market cycle cars of a cheap and simple variety, but whereas in England the tendency in design is inclining towards the miniature car type of machine, the Americans are generally following the pattern originated in the Bedelia.



The Imp, a light belt driven cycle car, the driver of which occupies the front seat.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Tour Through North Devon.

I propose going for a tour on my Douglas to Newquay in Cornwall. Will you kindly give me the best route from Bath to Weston-super-Mare, Weston-super-Mare to Ilfracombe, and Ilfracombe to Newquay round the coast?—E.W.B.

Your best route would be as follows: Bath, Marksbury, Stowey, Blagdon, Sandford, Banwell, Locking, to Weston-super-Mare. Weston-super-Mare, Highbridge, Bridgwater, Williton, Dunster, to Porlock. At the foot of Porlock Hill pay the toll and go through a private road to Lynton. The roads in this district are in a disgraceful condition, and the ascent from Lynmouth to Lynton is very steep and abominably rough. From Ilfracombe proceed to Barnstaple and then along the coast *viâ* Bideford, Hartland, Stratton, Boscastle, Trevena, Wadebridge, St. Columb, Newquay.

Questions of Design.

I should be obliged if you would answer the following questions: (1.) What is the proper ratio between wheelbase and track in a three-wheel cycle car? (2.) Is there any objection to a 7ft. wheelbase on a tricar with 4ft. 2in. track? (3.) What is the proper manner of weight distribution on same? Should it be on front or back wheel? (4.) Is friction drive satisfactory on a four-wheel cycle car? (5.) Is 1¼in. tube, gauge 10, strong enough for the frame?—J.B.

(1 and 2.) There is no fixed ratio for the wheelbase and track of a three-wheeled cycle car, nor should there be any objection to a 7ft. wheelbase and 4ft. 2in. track (3.) With regard to weight distribution, this should be arranged so that the weight is divided as evenly as possible, the maximum weight being on the rear wheel if it is the driver. (4.) Friction drive, if properly designed and made, is perfectly satisfactory on a four-wheeled cycle car, but great care must be exercised in the design. (5.) We have no idea what size engine or how much weight you propose to carry, but 1¼in. 10 gauge tubing would be strong enough for most ordinary purposes.

Adjusting for Benzole.

I ride a 1912 Bradbury with sidecar, and am desirious to run upon benzole, but each time I have tried to do so I have found it impossible to get enough air. This has been with a 22 jet, the smallest I could fit. The engine had been recently taken to pieces and thoroughly cleaned, the little ends being re-bushed. The benzole was a strongly recommended brand. I might add that though I sooted my plug every time, the different "feel" of the running of the engine was very noticeable when using benzole—it had more life and flexibility in it.—C.E. 1902.

There is only one thing to do, and that is to try fitting an extra air inlet in the induction pipe, which should be quite satisfactory provided it does not leak when closed. Most carburetters will run on benzole without the slightest alteration, though occasionally more air is needed. You might get some improvement by lowering slightly the level of the petrol in the jet.

L. W. Adams, of Sturminster Newton, whose recent successes include first in the lightweight class at Bournemouth Speed Trials and fastest time of the day at the Dorset A.C. hill-climb held recently at Shaftesbury. In both events he rode his 2¾ h.p. Douglas and in the latter event beat several cars and 3½ h.p. motor cycles.

Wear in an 8 h.p. Twin.

(1.) What is the horse-power of a V twin, bore 84 mm., stroke 90 mm.? (2.) Would water cooling increase power of above (3.) Where would above engine first show signs of wear? (4.) How many miles (approx.) should above engine run before the big ends would require re-bushing?—MOREDUN.

(1.) About 8 h.p., or rather more. (2.) Water-cooling would not necessarily increase the power but would enable the power to be maintained for a longer time. (3.) In the various moving parts, such as the connecting rod, big and small end bearings, main shaft bearings, etc. (4.) It is impossible to say. This depends upon the system of lubrication, whether the engine is air-cooled or water-cooled, etc., but, say, 5,000 miles. With water-cooling the wear would be slower than with air cooling.

Exhaust Valve Burning.

I should be obliged if you could explain the trouble I am having with my engine. For the last few months the engine has run very hot, causing the head of the exhaust valve to break off. I tried to get over the trouble by having the stem made thicker at the head. This has stopped the breaking, but the stem lengthens and burns away at the head. The timing seems to be right and the tappets move freely.—S.J.

The burning of the valve may be due to several causes: (1) The raising of the valve partially while the engine is still firing, which causes the flame of the exhaust to pass direct round the stem; (2) driving with the spark too much retarded; (3) using too strong a mixture; or (4) having the engine wrongly timed. Check over your timing carefully and see if it compares with that recommended by the makers.

London to Barnstaple.

I should be much obliged if you would inform me the best way from Muswell Hill to Barnstaple, and distance, avoiding London if possible. I had thought of starting *viâ* Hendon, Harrow, Uxbridge, and Slough. Where is it best to join the Basingstoke Road?—J.E.T.

If you go *viâ* Hendon, Harrow, Uxbridge, and Slough, this will be the best way out. You then join the Basingstoke Road *viâ* Windsor, Ascot, and Bagshot, continuing through Basingstoke, Whitchurch, Andover, Salisbury, Shaftesbury, Sherborne, Yeovil, Ilminster, Taunton, Bampton, South Molton, and Barnstaple.

Misfiring at Slow Speeds.

Recently I took to pieces my 1912 2¾ Enfield (including the magneto). After re-assembling, the machine misfired badly at slow speeds, but improved at high speeds. I have examined all parts, but cannot find out the cause. The carburetter floods and the jet is clear. It is an Amac carburetter, and does not seem to be adjustable. The valves shut closely and compression is fair. The plugs both show good sparks when tested on the cylinder. Can you suggest a reason for this misfiring? I might possibly be using some unsuitable spirit.—A.A.

You do not appear to have examined the amount of break in the platinum points of your magneto. See if they are breaking sufficiently, and also look to your plug points and see that they are not too close together. In putting back your carburetter you may have caused an air leak in the carburetter itself or the induction pipes. It is also quite possible that, in taking the magneto to pieces, you have destroyed the magnetism in the magnets; in this case they must be re-magnetised.

Overheating and Timing Difficulties.

I should be pleased to have your opinion on the following matter in regard to my 1912 Bradbury: (1.) I am much troubled with my cylinder and crank case heating up excessively. I have good compression, use good oil, cylinder and piston are both free from carbon deposit, I use a 32-jet, and ride with ignition well advanced. My cylinder is just new, and when fitting same I had to take fully ⅛in. off valve stems to allow them to sit on their seats. In connection with this I wondered if combustion chamber was too small, thus causing the overheating. When this overheating takes place the engine knocks when I am mounting, and also when picking up. (2.) I notice that in your answers on ignition timing you state that with the points breaking and piston at top of compression stroke, the ignition lever should be fully retarded. I have my timing as above but with lever half way advanced.—J.K.

From your letter it seems that a different type of cylinder has been fitted, with the result that the compression is very much higher than standard practice. From the dimensions you give, it would be impossible accurately to calculate the exact pressure, but we think that you would be advised to refer the matter to the makers of the machine, who would be able to give you the compressions from their mechanical drawings, and to substitute another cylinder, if such be necessary. Another plan would be to try a lower pressure by inserting a few strips of metal between the cylinder and the crank case until the engine runs smoothly. As regards the ignition timing. This varies very much with the particular machine to be timed, some taking very much more advance than others, and, in any case, the timing alters according to the use to which the machine is put.

Newcastle-on-Tyne to Twickenham.

I intend going to Twickenham from Newcastle-on-Tyne on my Clyno and sidecar. I shall be glad if you will kindly give me the best way off the Great North Road, avoiding as much traffic as possible. I presume there is no possible way of avoiding the shockingly bad road between Gateshead, Birtley, and Chester-le-Street to Durham, which must be about the worst piece of road in the kingdom. The last time I went over this road, even my magneto was loosened from its platform.—However, if you can let me know the best route from Newcastle to Twickenham, avoiding the London traffic, I shall be greatly obliged.—H.F.

You cannot well avoid the bad road between Newcastle and Neville's Cross. Of course, it is not necessary to go into Durham. You can vary the route a little after Durham by going through Bishop Auckland and West Auckland, then right down Leeming Lane to Boroughbridge. This is a very fast road. As regards the London part of the journey. Your best plan is to purchase a copy of the R.A.C. Official Map of Recommended Routes Round London (obtainable from these offices price 1s. 7d. post free), and follow the road marked in blue from Barnet to Fulwell Park, where turn left for Twickenham.

The Utility of Nail Catchers.

I have just taken delivery of an 8 h.p. Rex-Jap and sidecar, and regret to say that, although I have only done 500 miles I have had six punctures caused by nails, etc. I shall be glad if you will tell me (1) whether tyre liners will prevent this trouble, and (2) whether you can recommend a good make of nail catcher, which can be fitted to the back wheel of my machine.—F.A.N.

We should think that the best way out of the difficulty would be to fit a nail catcher. These may be obtained from most accessory dealers, or could be made by fixing a piece of wire close to the tyre, or by leaving a piece of chair hanging loosely on the tyre. Either of these devices should be effective.

EXPERIENCES WANTED.

"Foxall" (London).—8 h.p. Henderson, four-cylinder, air-cooled, reliability.

"J.O.L." (Bristol). — 3 h.p. Enfield 2¾ h.p. Humber.

"H.B." (Putney). — F.R.S. electric headlight. Do accumulators stand the vibration of back carrier?

"J.F.T." (Manchester). — Carburetter for 2¼ h.p. F.N.

"S.G.F." (Catford).—Williamson and sidecar, water-cooled, especially as to how much work done on top gear.

"O.W." (Leicester).—5-6 long stroke Rudge Multi.

"A.L.B." (Mansfield).—Experiences of amateur motor cyclists with Scott machines as regards petrol consumption with Scott, Lukin, and Binks carburetters, and life of chains.

"F.C.O." (Stourbridge).—Best wearing and thoroughly waterproof motor cycle clothing, mackintosh or oilskins. Names of dealers.

"H.T." (Aughton).—2¼ Baby Levis single gear, hill-climbing, speed and m.p.g.

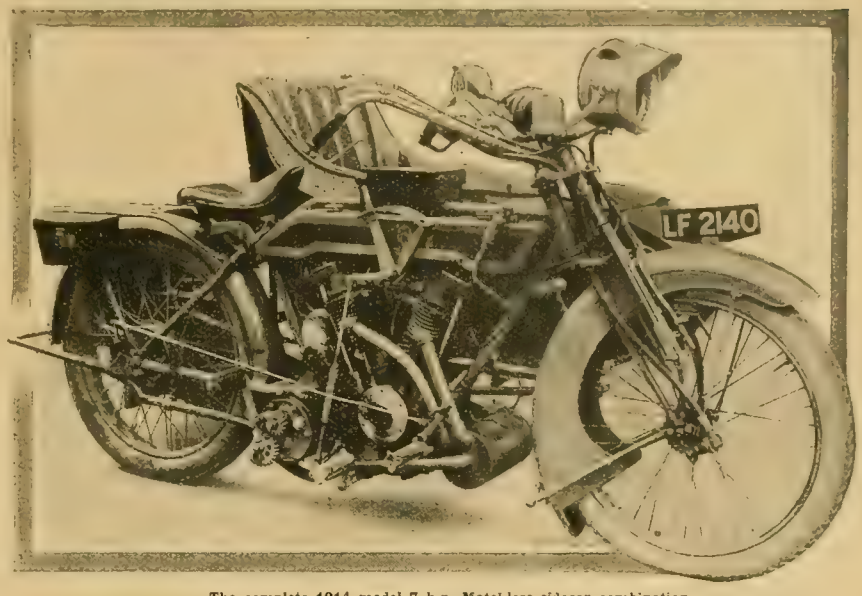
"J.B.B." (Purley).—Brampton variable gear for lightweights, especially as regards belt wear.

THE TRIAL IN NORTH WALES. V. Busby (2¾ h.p. Sunbeam) in the watersplash near Llansannan.

THE MATCHLESS 1914 MODELS.

FEATURES: New 7 h.p. Sidecar, Car Type Gear Box, Extreme Silence and Comfort.

WE recently spent a very interesting afternoon with Messrs. H. Collier and Sons, Ltd., going thoroughly over the latest pattern Matchless models. We made a brief announcement of these models in our issue of 8th May last. First of all, as regards the solo models, there will not be any serious alteration. The speciality for 1914 will be a 3½ h.p. twin with J.A.P. engine, fitted with enclosed chain drive to the counter-shaft and thence by belt to the back wheel which is fitted with a three-speed Armstrong gear. This is an exceedingly handy little mount, capable of going anywhere. The chain case will be of sheet metal instead of aluminium, and the spring forks will have a bigger range of action.

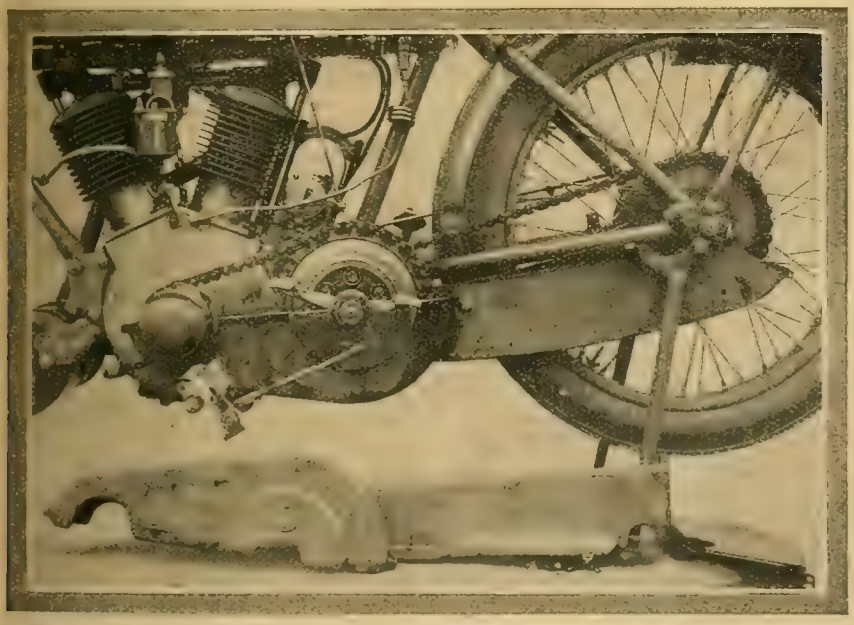


The complete 1914 model 7 h.p. Matchless sidecar combination.

The 7 h.p. Passenger Machine.

The chief item of interest, however, which we inspected was the 7 h.p. sidecar combination, fitted with a totally new engine. This engine is one of the most attractive points of the machine. It has a bore of 92 and a stroke of 94 mm. The inlet valves are worked on the overhead system, and the mechanism operating them is entirely enclosed. Even the tappet rods are enclosed in tubes, while the rockers are also entirely closed in, and the lubricant is admitted to these from the engine. With this system air leaks are practically impossible, and this enables the engine to be run at very slow speeds. There is also a total absence of valve clatter, and the chief noise noticeable when one is running at moderate speeds is the air rushing into the carburetter. The engine is beautifully finished throughout, and its exterior is quite remarkable in this respect. Moreover, even after long runs, the crank case is wonderfully clean. The magneto is situated behind the rear cylinder, well out of the way of the elements, and the extremely neat method of fitting is clearly shown in the accompanying illustration. The exhaust pipes are led into a spacious exhaust box, and the final exit is through a long pipe.

From engine to counter-shaft the transmission is by means of a silent chain, and thence by an ordinary roller chain to the rear wheel. Both the chains are entirely enclosed. Since we last saw the machine the latter feature has been added.



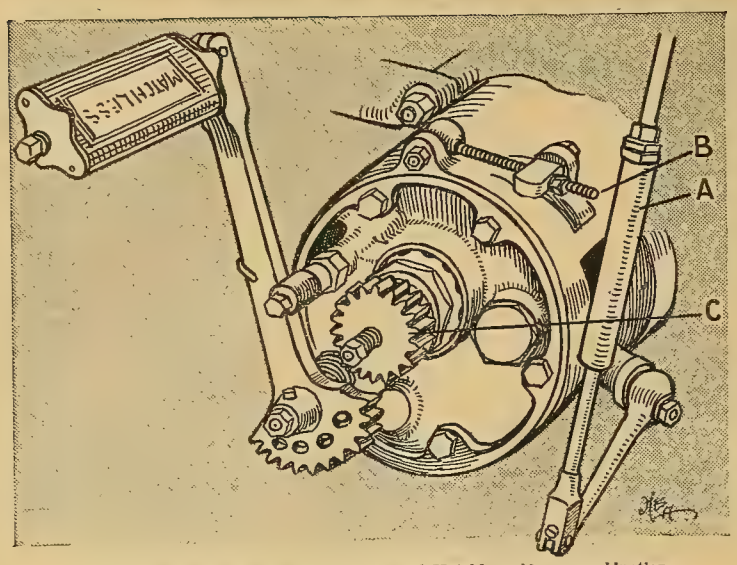
System of transmission employed on the 7 h.p. Matchless sidecar combination showing the counter-shaft gear clutch and chain cases.

On the counter-shaft a metal to metal clutch is carried, which is particularly sweet in action. The gear box now contains three speeds and is cylindrical in shape, being carried on special lugs on the bottom bracket. Dog clutches are provided for the first and top speeds, while the second speed is of the sliding type. The gears slide on a castellated shaft. Both the space between the castellations and also the interior of the sliding gear wheel are accurately ground, thus ensuring a perfect fit, absolute truth, and preventing any noise on the intermediate speeds. The kick starter, which is carried on the gear box, is most substantial, and the bush on to which the ratchet wheel is fitted is provided with a gland to prevent any leakage of oil; in fact, the whole gear box is absolutely oiltight, so that engine oil may be used therein.

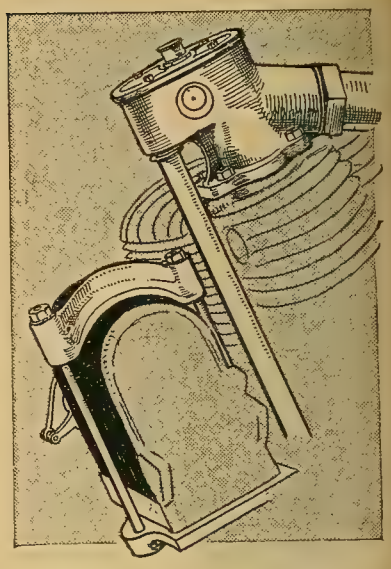
Easy Chain Adjustment.

The method of adjustment is interesting, an adjusting bolt and screw being fitted to one end of the gear box, and the other end fastened to the special lug which carries it, so that, if the adjusting screw be turned the whole gear box may be rotated slightly, thus taking up the slack in the front chain. That portion of the kick starter carrying the pedal in its "off" position comes up against a rubber buffer, so that the pedal flies back without noise on being released. A neat form of gate change is provided, which was sketched in our issue describing the mechanical fitments in the A.C.U. Six Days Trials. The operating rod is provided with a buffer, and when the lever is placed in the first speed notch, if the dogs do not engage at once through the action of the spring, they will fly into engagement on the first movement of the gearshaft. The rear brake is of the internal expanding type, and is very powerful in action.

It is interesting to note that the oil when fed through the pump is divided



Gear box and kick-starter of the latest model Matchless sidecar combination,
A. Gear operating rod fitted with spring buffer.
B. Front chain adjuster. C. Oil tank gland.



Enclosed overhead valve mechanism and method of carrying the magneto on the 7 h.p. Matchless.

into two portions by means of a branch pipe, one portion going to the engine and the other to the clutch, from which any excess is thrown by centrifugal force on to the silent chain. The mudguards are wider, and to the front wheel most efficient side shields have been fitted. The range of action of the spring forks has been increased, and grease cups are now provided to the movable joints so that efficient lubrication in these parts is ensured.

A Luxurious Sidecar.

The sidecar chassis is a particularly fine piece of design. It is composed entirely of straight tubes. The long member running parallel with the frame is now strengthened by a girder. The chassis is dropped, and the bar supporting the body runs right through the latter, passing right underneath the seat. Incorporated in the design of the chassis is a place for carrying a spare petrol can, and provided with springs to prevent the latter from rattling about.

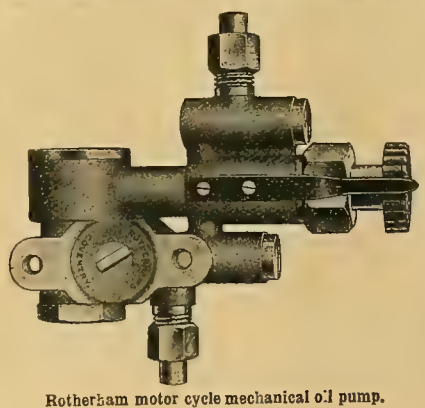
The body is a very nice piece of work, being constructed of three-ply mahogany, which is guaranteed to stand a tropical climate. A small locker is placed underneath the top portion of the body and an ample locker underneath the seat. The cushion is properly sprung, following motor car practice. In future models the well-known Matchless khaki finish will be extended to the sidecar upholstery. The sample which we saw was particularly handsome. Messrs. Collier and Sons are also considering the fitting of a luggage platform to the sidecar body, so that by this means the luggage is carried on the sprung portion of the combination.

Impressions of a Trial Run.

After our examination Mr. Harry Collier took us for a trial run for a considerable distance in the machine, which impressed us particularly by its extraordinarily sweet running; in fact, the engine was dead quiet in every respect. There was an entire absence of valve noise, and a particularly silent exhaust, so that conversation could be carried on without the slightest difficulty. The district round Woolwich abounds in hills, and we were given ample opportunities of seeing the wonderful power provided by the machine on heavy gradients. We were also particularly impressed by the power of the foot-brake, which was really quite remarkable. On Shooters Hill, and on another gradient, which was certainly not easier than 1 in 8, the combination was turned round and made to re-start on second speed, on several occasions, which, owing to the efficacy of the clutch, it was able to do without much trouble. During the long ascent of Shooters Hill, Mr. Collier allowed the machine to come almost to rest, and while still on second speed let in the clutch by no means gently, with the result that the engine took up the load without a falter. From stem to stern the combination is a magnificent piece of work, and is absolutely in the front rank of passenger vehicles.

A MECHANICAL LUBRICATOR.

A small mechanical oil pump for attachment to the side of a crank case has been introduced by Messrs. Rotherham and Sons, Ltd., Coventry. The pump is of the plunger type, and is connected to one of the timing wheels by means of a screwdriver joint, the slot on the end of the shaft fitting into the screwdriver blade formed on the end of the pump gearshaft. A small worm gear is employed to transfer the motion to the plunger, which is forced in and out by a cam and roller. The supply pipe from the usual oil reservoir in the tank is connected to the upper union shown in the photograph, and the delivery pipe to the engine to the lower one. A small wheel indicator is employed to show the quantity of oil pumped; there is also an adjuster shown on the right of the illustration. This, when "full on," is screwed down to a stop, and in this position pumps one pint of oil for 26,660 revolutions of the worm spindle. If the half-time wheel revolves 1,145 times in a mile a pint of oil is pumped with the adjuster set full on, and a gallon in about 122 miles. The adjustment from this point can be graduated until no oil is pumped. This adjuster can be arranged to work by Bowden cable from the handle-bar.



Rotherham motor cycle mechanical oil pump.

"Motor Ways in Lakeland"

Mr. George D. Abraham, whose articles on sensational motor climbs among the mountains in the Lake District, have often appeared in our columns, has lately published, through Methuen and Co., Ltd., London, a very fascinating volume under the above title. It deals in chatty manner with all roads possible for motors in the English Lakes, and is illustrated copiously with superb photographs by the author, who is quite unsurpassed in this art. The price of the book is 7s. 6d.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Compressing Valve Spring.

Sir,—The following is a good tip for compressing stiff valve springs preparatory to tying them up with string. Unscrew the large spanner (always supplied with modern machines) to its maximum, compress the spring by hand, and put it between the jaws of the spanner. Then, taking the spanner with its head resting in the palm, and the fingers over the other jaw, draw the jaws together, at the same time, with the other hand, screwing up the slack of the small milled screw. I quite appreciate "Ixion's" remarks about not being able to turn the screw under ordinary conditions, but I think that if anyone tries my suggestion he will find it easy to manage even a 50 lb. spring.

K. J. KIRKPATRICK.

A Problem.

Sir,—I may say that I had just the same trouble as your correspondent writes of, only with a different engine. However, I discovered that, although the exhaust valves were theoretically timed right, they were the cause of the trouble, and by timing them to close slightly later, I got excellent hill-climbing powers and fifty-five miles per hour on the level, whereas, formerly, the machine would only do thirty-five on the level and refused to look at anything in the way of a hill. Hoping this letter may be of some use in the present case.

PHILIP BAILEY.

Sir,—I was much interested by your correspondent "Twin Jap's" letter, headed "A Problem." I have a standard free engine, 3½ h.p. 1912 Bradbury, which has only been 2,500 miles. I can get 50 m.p.h. out of it easily on the flat, but I suffer from knocking when the engine picks up after slowing down, or on a hill. The gear is 4½ to 1.

I have had the cylinder down lately and compression and valves seem to be all right. I have oiled the engine very freely, but cannot even get it to smoke at all. I have tried a 30 jet but it made matters worse, and so have gone back to the standard 32. I might add that the engine hardly ever knocked when I first had the bicycle, and the retarding of the spark always stopped it at once, which it fails to do now.

JOHN CROWDER.

Sidecars and Cycle Cars in Singapore.

Sir,—I enclose a photograph which may be of interest to you from an overseas point of view. The machines represented are an 8 h.p. Humberette, an 8 h.p. G.N. chassis with J.A.P. engine, and a 3½ h.p. Rudge-Multi, the last named being the property of the writer, who along with the others shown all live together in the same "mess"; we may therefore be said to constitute a small motor club of our own.

There are over two hundred motor bicycles in Singapore now, and as the roads are excellent and there is no speed limit, one has plenty of chances of "letting it out" once clear of the town.

Cycle cars are only just being imported here in any numbers, but will soon, I think, become extremely popular, as they afford the protection from tropical rainstorms which a motor cycle cannot give.

I would add that we are all regular readers of your interesting paper.

T. A. POWELL.

Singapore.

An Undesirable Practice.

Sir,—Being a regular reader of your paper, which I have always looked upon as the chief organ of motor cycling, I was somewhat astonished to read your leading article on "Carrier-riding" in *The Motor Cycle* of September 25th. In my opinion, it is more of the type one would expect from a lay contributor than from the pen of the leader writer of a paper devoted to the sport. The writer is no doubt perfectly entitled to give his views in regard to the safety or otherwise of this practice, but to hint at legislation is going too far. I do not agree with the writer's contention, but if there be danger, as he alleges, in this practice, it is only danger to those who indulge in it, not to the general public—[See letter from "Maxime"—Ed.]—and I submit that anyone has a right to take risks with his (or her) own life if he so chooses. If not, why not pass laws to forbid flying, motor racing, or hunting, or for that matter any sport in which there is an element of risk? The writer of the article implies that the chief objection to the practice is that girls are more often than not the passengers carried. Perhaps he also disapproves of lady motor cyclists and "air women"!

MOTORING IN SINGAPORE.

A Humberette, G.N., and 3½ h.p. Rudge Multi sidecar in Singapore. Photograph accompanying T. A. Powell's letter.

If we are to imitate the grandmotherly legislation of some of the American States, where pillion riding is forbidden, the traditional liberty of the British subject will become rather a doubtful quantity. For instance, in some States women are not allowed to wear slit skirts or to bathe without stockings, etc. I do not think any English Government is likely to legislate in this absurd way, at present.

I must also contest the assertion that the average carrier is not strong enough for the work. With nearly all machines of 3½ h.p. and over, the carrier is a very solid affair, and the makers know it will be used to carry a passenger; indeed, the B.S.A. Co., in their book, say, "Do not take a sidecar *and* a carrier passenger."

If pillion riding strains the back tyre, what about sidecaring? I have taken passengers on the carrier for years both on singles and on big twins, but the only two spills I have had were in no way attributable to the fact of having a passenger carried in this way.

Even supposing I were one of the "rash youths," the writer speaks of—though several years' riding in all conditions without any serious spills should disprove it—I should still assert my right to ride as I pleased, even to the extent of rashness if I so wished, so long as I did not become a danger to the public. Being entirely a matter between driver and passenger I fail to see that it is anybody's business to interfere.

I am confident that I shall find support amongst all those motor cyclists who wish to retain their liberty to put their machines to what use they please, and especially amongst those who cannot afford a sidecar, or who prefer solo riding.

With apologies for the length of this letter,

LESLIE J. MANN.

Sir,—It was very forcibly pointed out to me on Sunday, Sept. 28th, what a truly undesirable practice carrier riding is.

A friend and myself were riding leisurely along a road near Royston when another machine with passenger (male) on the carrier was coming round a slight bend. My friend was in front and well on his proper side of the road, yet the other driver could not manœuvre his machine round the bend. The result was that after a few spasmodic efforts to get past, both on the right and left side of the road, he gave a "death yell" and charged my friend. The sides were ripped off each other's machines, but the drivers were fortunately more or less unhurt. I myself met one of the falling machines.

Now, I am certain that had there been no passenger on the carrier the driver of that machine would easily have avoided an accident. It is hopeless to argue that a machine steers well with a passenger on the carrier. I speak from the experience of both passenger and driver. It is still more dangerous if the driver is not thoroughly used to driving a motor cycle, not only for the riders themselves, but for all users of the highway. Anyway, it is an altogether undesirable practice.

MAXIME.

Tyres for Heavy Sidecars.

Sir,—I see the question of tyre wear cropping up occasionally in *The Motor Cycle*. Surely the remedy for all tyre troubles is to "over tyre" the machine.

Acting on this principle the following is my experience of 12,000 miles odd in seven months, commencing with a new machine, a Chater-Lea No. 7 and sidecar.

Tyres: Front wheel, 650 × 65 Michelin; back wheel, 700 × 80 Dunlop Grooved and liner; sidecar, 650 × 65 Michelin.

After about 2,500 miles the back tyre was down almost to the canvas, showing even wear everywhere. I had done a lot of high speed riding on the road up to and above forty-five miles per hour. Front tyre worn evenly all round, only slightly, but to one side, owing to different diameters of back and sidecar tyres. No signs of wear on sidecar tyre.

I then fitted new 700 × 80 to back with old liner (quite good), reversed front tyre to equalise wear, and had new tread on old 700 × 80 cover.

After about 6,000 more miles I discarded front tyre, nearly down to canvas, put sidecar tyre on front wheel, and retreaded cover on sidecar with a liner.

Back tyre still in good condition. As I was going touring with a fourteen stone passenger and luggage I fitted a new 700 × 80 and carried the old one and discarded 650 × 65 as spares.

After about 3,000 to 3,500 miles more, including 1,230 tour round England and Scotland in November, these tyres were on the machine when I sold it. I had no puncture nor any form of tyre trouble in about 12,000 miles, though at Fort William, after running up from Glasgow, I found seven pieces of iron in my back tyre.

I should point out that the cost of a 700 × 80 Dunlop grooved is only a few shillings more than a heavy 26in. × 2½in., and about six times as strong.

I've been told heavy tyres slow a machine, but I could get fifty miles per hour with a passenger, which is more than I ever want. I have been told, also, that a liner "heats up the tyre." Perhaps it does; if so, it seems to make it very reliable. Personally, I've never found it to do so.

Incidentally, I should like to mention I used petrol and paraffin in equal parts and any oil that came along. During the time I had the machine, barring a collision, I never had a moment's trouble with any part of it, and I rode in all weathers and over all kinds of roads. I consider that this machine, with the tyres mentioned, has reached the limit of reliability. Of course, we all have our own ideas of "improving" any machine, but the only improvement I can think of for this machine is a waterproof chain case for wet weather riding.

Need I add that I am not interested in either the machine or tyres mentioned?

SURGEON, R.N.

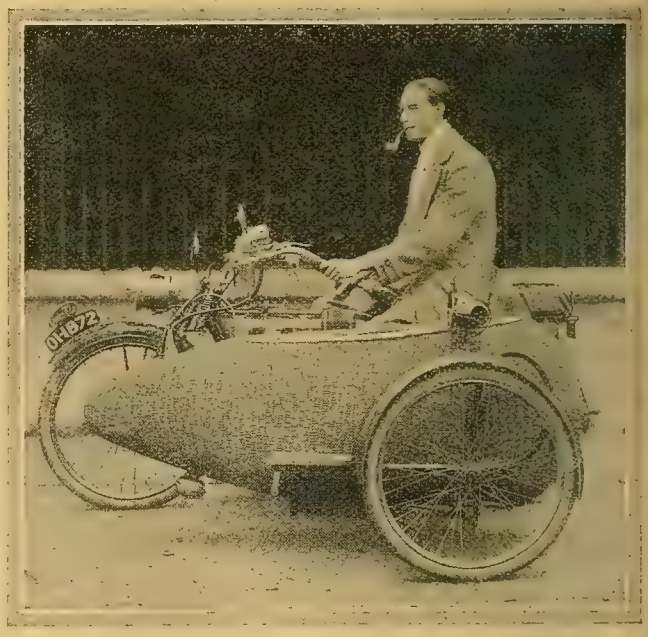
Changsha, Hunan, China.

A Sidecar for a Douglas.

Sir,—I send you herewith a photograph of the sidecar which I attached to my 1913 Douglas last Easter. It is unique and offers little wind resistance. At the rear, the body is suspended from saddle springs attached to the tubing, which is carried upwards (C shape) from the hub centres, doing away entirely with the usual heavy C springs. The fore part is swung on shackles only.

The chassis is dropped six inches in front and seven inches at the back, the axle being reinforced. Driving tyre, 2¼ inches, and Service leather belt used.

The body is lined throughout with bright pink imitation leather, the seat and back upholstering are both detachable



A neatly designed wicker sidecar on a 2¾ h.p. Douglas. (See letter.)

and a surprising quantity of clothes, etc., can be stowed away at the back—of course, out of sight. When seated the passenger's head and shoulders only are visible.

The combination pulls well, but the chain stretches constantly—which is only to be expected.

During August I started from the pier at Eastbourne for a run up to the top of Beachy Head (with lady passenger, nine stone). This I accomplished, changing into low (8¾ to 1) at the foot of Beachy Head proper.

KNUTS EGG.

HUTCHINSON

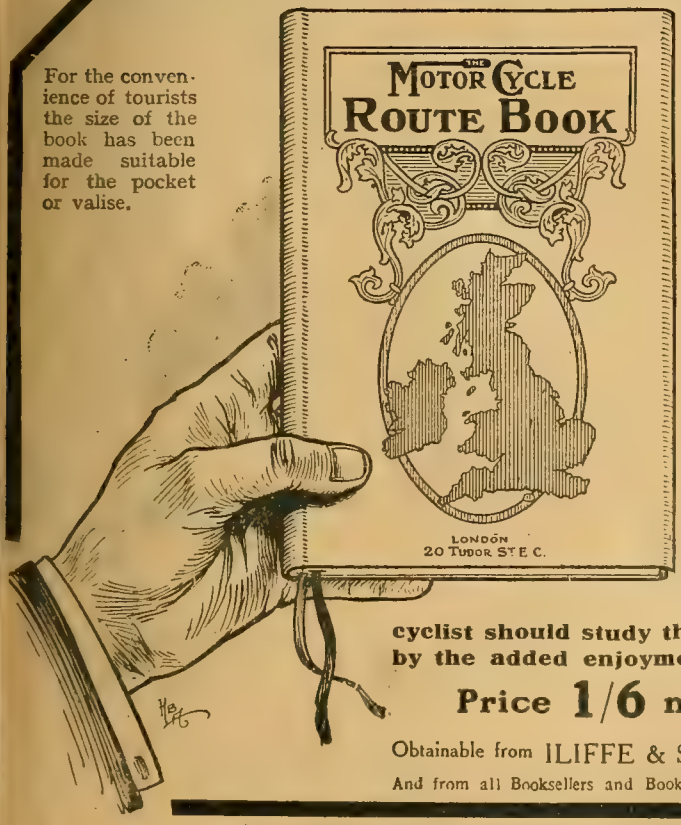
MOTOR CYCLE TYRES.

IMPORTANT ANNOUNCEMENT.

WE beg to call the attention of all motor cyclists to the new qualities and important reductions in prices of Hutchinson Motor Cycle Tyres in force from October 1st, full particulars of which can now be obtained from any Agent, or by writing direct to the Company.

HUTCHINSON TYRE CO., 70, Basinghall St., E.C.

For the convenience of tourists the size of the book has been made suitable for the pocket or valise.



Know your road before you start.

It will save much time and discomfort.

"The Motor Cycle" Route Book contains carefully selected routes for the whole of the British Isles, with distances clearly shown; 45 Sectional Maps and Index Map (by Bartholomew), Speed Limits, and a copious index.

In every case the BEST route—and not necessarily the shortest—has been chosen. Large towns, congested districts, and bad roads are avoided.

Before commencing a tour every motor cyclist should study this book carefully. He will be well repaid by the added enjoyment which comes of freedom from worry.

Price 1/6 net. By Post 1/9.

Obtainable from ILIFFE & SONS LTD., 20, Tudor Street, LONDON, E.C.

And from all Booksellers and Bookstalls. *(Remittance should accompany orders sent by post.)*

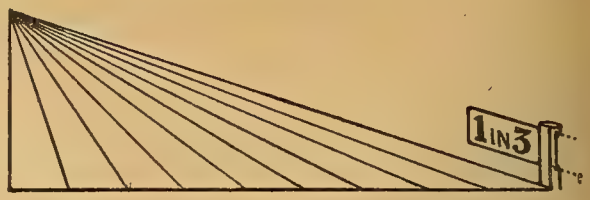
ABINGDON-ECCO, Ltd., Tyseley, BIRMINGHAM.



Climb 1,750 feet in a mile, and you

will want to have motor-cycle tyres which grip any surface—which will stand frightful bumps and shocks, and sharp stones. At least that is what Messrs. W. B. Little, Raymond Drinkall and T. B. Westmorland found on their recent famous climbs of redoubtable Skiddaw and Helvelyn.

¶ All three of these daring riders used Stelastic tyres. Skiddaw is 3,058 feet high. There is a rise of 1,750 feet in less than a mile—an average gradient of one in three. At many places the grade is almost one in two.

¶ There is no road or pathway. For a long distance the surface is covered with loose stones of shapes and sizes calculated to strike terror into the heart of any rider —or tyre!

¶ But, as is now motor-cycling history, all three of these Stelastic users accomplished this marvellous climb with flying colours. On Mr. Little's machine were the same Stelastic tyres which he used in the Six Days Trial.

¶ Do you know the unique construction of Stelastic tyres which makes such almost unbelievable wear possible? Let us send you printed matter which tells about the wonderful Stelastic Tread, in which woven steel "meshes" "give and take" in perfect harmony with the purest Para rubber. Stelastic tyres are absolutely cut-proof, and almost impossible to puncture. If you do not know the address of the Stelastic Depôt nearest to you, we shall be glad to advise you.

STELASTIC TYRES, LTD.,
76, York Street, Buckingham Gate, London, S.W.

Stelastic Tyres

How to Test Benzole.

Sir,—I have been much interested in the letters and "Replies to Correspondents" which have appeared in your columns of late. I shall be glad to know if you think there is any likelihood of benzole clogging up the gauzes which are fitted in the ports on a Scott motor cycle. I have used it intermittently for the last three months, and on changing the gauzes a few days ago I found that some had clogged up with what appeared to be a sooty deposit.

I certainly obtained greater power, an increased mileage per gallon, and altogether more satisfactory running when using benzole, but I should like some information as to the fouling of the gauzes referred to. ROUNDLAY.

Sir,—Your contributor of the article "How to Test Benzole" has made an important omission, which may mean serious burns to the novice. It is usual when testing benzole to use a water-cooled condenser. In the first place the apparatus, as illustrated and described, would fail to give accurate results except in the hands of an expert manipulator. In the second place many novices will, in all probability, use a gas ring or something equally unsuitable, and begin to distil at such a rate that practically no condensation would take place and the vapours would ignite through their proximity to the flame. I may add that I am using benzole and would not return to petrol whilst benzole is to be obtained. TECHNICAL CHEMIST.

Sir,—I have read with considerable interest the article in your issue of September 25th on "How to Test Benzole," but should like to take exception to your contributor's statement that there is no quick and accurate method for the estimation of sulphur in benzole. It is true that the only way to determine the total sulphur in benzole is to burn it and weigh the subsequently produced barium sulphate. Carbon disulphide and thiophene are, however, the chief sulphur compounds present, and these can be quickly and easily estimated with accuracy with the aid of a good balance. Moreover, it is possible, with a little experience, to say, without weighing, whether a sample of benzole is high or low in sulphur content.

Carbon disulphide is estimated by the amount of precipitate produced on addition to the benzole of phenyl-hydrazine, and thiophene by the amount of precipitate produced on the addition of a solution of basic mercuric sulphate to the benzole, dissolved in methyl alcohol.

Anyone can obtain the chemicals and the necessary apparatus (a few test tubes) at a very small cost from almost any chemist.

After all it is the amount of sulphur present in the benzole which is of chief interest to the motorist, as the specific gravity and boiling points of most brands of benzole now on the market can be depended upon to be fairly right.

With regard to the alleged test for sulphur by the immersing of a copper strip, I may say I have purposely performed experiments with samples of benzene known to contain as much as 600 grains of sulphur per gallon, and have been unable to obtain any discolouration.

It may be of interest to your Scotch readers to know that benzole from Scottish coal or shale contains remarkably little sulphur. CHEMIST.

Petrol Consumption.

Sir,—In view of your remarks on the Sutton Coldfield and Mid-Warwickshire Club's petrol consumption trial, I, as a competitor, should be glad if you will publish this letter. My machine is a 1913 A.C. Sociable, bought in the ordinary course last May. Before the trial the tank was filled on the weighing machine and then weighed, together with myself and passenger. I then drove round the course, on which there were numerous official observers. On returning, the tank was again filled from a glass measure, graduated in ounces. To make sure that the tank would not hold a drop more the tricar was swayed sideways, and it was even insisted on being in the same position on the scales as when first filled. I also believe that all competitors were treated the same in the above respects. My tank would not take a fraction more than 38 ozs., and all speedometers registered at least twenty-four miles. The trial was a non-stop, and it is impossible to remove the filler cap on an A.C. with hood on. Nothing whatever was consumed except the fuel in the tank and the usual amount of lubricating oil in the engine (about three pints for 600 miles). Further, my test was under unfavourable conditions, owing to brake trouble, and any representative of yours who may "require some amount of convincing that such remarkably economical results are possible" can be given a reasonable opportunity to see the "impossible" accomplished easily. PERCY W. HILL, F.C.S.

Sir,—It would be of interest to myself and to the many readers of your valuable paper to know how it is possible to get such an enormous mileage as 334 miles to the gallon (petrol) as was done recently by Mr. T. Pollock in the Sutton Coldfield trial, riding a twin James. A few hints from this rider would, I am sure, be very acceptable. Personally, I should be very pleased to get half this distance to the gallon on a give and take road, be it single or twin. I have often heard it said that the modern motor cycle would fire on a whiff of petrol, and will soon be able to go simply by smelling it. There seems to be some truth in this statement. W. S. BACON.

Sir,—In reading the short paragraph in the last issue of *The Motor Cycle* it seems to me some doubt is entertained as to the validity of the official results of the fuel consumption trial recently held by the Sutton Coldfield and Mid-Warwickshire A.C.

The figures no doubt seem remarkable, but as I both tuned up and drove the 10 h.p. Singer in the competition, I am perfectly satisfied that the mileage registered was quite correct, as I obtained nearly the same result whilst testing my final adjustments two days previous to the event.

Perhaps when I tell you the weight of the car with driver, passenger, and accessories was as much as 13½ cwts. you will be even more surprised at the mileage, and especially when I state that the automatic features of the Claudel-Hobson carburetter were retained exactly as turned out by the makers and no such extras as additional air used.

However, in order to clear away any possible doubts, I offer to repeat the same performance over the same course, and under the same climatic conditions, with one of your staff as a passenger, who can also satisfy himself that the measuring of the fuel is correct.

The results were obtained only after repeated tests on the road after each adjustment and results carefully noted. This coupled with careful driving and watching every possible point is my explanation of my own performance.

I can only speak for myself, but I think the other competitors who obtained the high mileages would be quite ready again to turn out, and I invite you, Mr. Editor, to witness another test, when I hope the other competitors will be prepared to demonstrate what is possible after careful tuning up and studying carburation.

Hoping it will be possible to arrange this demonstration,
HOWARD SMITH.

[We shall be pleased to accept these offers.—ED.]

C, G. Fullin (3½ h.p. Rudge), winner of the Seventeenth Short Motor Cycle Handicap at Brooklands on Saturday last. The second race was postponed.

Stolen Machines.

Sir,—In the last issue, on page 1288, we note that Mr. Bird, of Queenstown, has been the victim of a thief.

With regard to the new Skew non-skid cover we would like to advise you that each cover has a certain number on it, and this would perhaps help in tracing the machine. If Mr. Bird does not know the number of the cover, if he could tell us from whom it was purchased we may be able to supply the number. OYLERS', LIMITED.

A.C.U. Official Records.

Sir,—I should like to draw your attention to the curious anomaly existing at present with regard to A.C.U. records.

The present one hour sidecar record is held by S. F. Garrett on a 3½ Regal-Green-Precision, at a speed of 50.99 m.p.h. This should cover all records up to one hour unless faster time is accomplished, whereas the record speed was only 50.56 m.p.h. for five miles in the same class. I think it would be of general interest to comment on this in *The Motor Cycle*. ERNEST SMITH.

[The matter is to be considered at the next Competitions Committee of the Auto Cycle Union. It is probable that the A.C.U. will decide that the larger record covers the smaller, but it must be borne in mind that during an hour record the five-mile times are not taken, and it is therefore impossible to say when the five-mile record was broken.—ED.]

The Price of Motor Cycles.

Sir,—I am glad to note the letter of your correspondent, "Mancunian," on the above subject and heartily endorse his remarks thereon.

Messrs. Humber, Ltd., have certainly done a very good thing for the motor cycling world, and I believe that so soon as the other firms bring themselves into line with this enterprising firm, the sooner will the membership of the A.C.U., A.A., etc., increase by leaps and bounds.

Like "Mancunian," I am not yet a motor cyclist, though I hope to be one shortly (at present I am seeking and, I hope, gaining valuable experience), and I also greatly enjoy reading your journal and send my best wishes for its continued success.

Whilst writing you please let me strongly endorse your remarks on the dangerous practice of carrier riding, which was the subject of your leading article in a recent issue.

G. GORDON G. FRANCIS.

Speedometer Drives.

Sir,—With regard to "Ixion's" remarks concerning speedometer drives, I, in common, no doubt, with many other users of the front wheel type of drive, have experienced just the troubles to which "Ixion" refers. Consequently, I should welcome any device which would obviate this annoyance, and in this respect "Ixion's" idea of a speedometer drive from the counter-shaft when there is a rigid drive to the back wheel seems to me an excellent suggestion.

His latest note on this subject has left me wondering, however. I do not see how any speedometer maker is going to "standardise an instrument" which will be guaranteed to register miles per hour if it is to be driven from the magneto transmission, *i.e.*, to run in proportion to the speed of the engine. It seems to me that the instrument will have to be re-calibrated every time the unfortunate owner changes his gear ratio. Then again, what about the vagaries of slipping belts and clutches? "Ixion" calls attention to the fact that the trip recorder would have a busy time during a period of free engine work. In this respect it seems to me that people using the free engine a good deal—as one does with a heavy sidecar combination—would have a marvellous story to tell of the number of miles per gallon they had accomplished, since the engine running lightweight would make the trip recorder buzz on very little petrol.

However, I am always ready and anxious to learn, and if there is a solution to this mystery I shall be interested to hear it. L. A. McDOUGALD.

[Unfortunately, there is not.—ED.]

Sir,—I could not but smile as I read "Ixion's" comments under the above heading, particularly where he suggests that the speedometer be driven off a portion of the engine mechanism. What a magnificent mileage the rider of a variable geared and free engine machine would put up each month! Imagine the surprise of the novice with his speedometer fitted in the manner suggested, when riding up a hill a mile long on his lowest gear, to find his speed about sixty miles an hour and the hill four miles long. Probably the opposite effect would take place when driving all out on top gear. Anyhow, it would be particularly interesting if "Ixion" would explain just how he would render his suggestion practical.

The point, however, which I have in mind, and which I wish to criticise seriously, is the question of rear *versus* front wheel drive. As long as rigid forks were used front wheel drive was entirely satisfactory, but now that spring forks have become a regular thing, the whip of the transmission caused by the action of the front forks is very detrimental to the driving mechanism. For the past eight months I have been using on my own machine a rear driven Corbin-Brown speedometer; I find that the recording is accurate and there is practically no whip even with the Indian rear spring frame, and the mechanism is so attached that the rear wheel can be removed without disturbing the speed indicator in any way. If it become necessary to adjust the rear wheel in and out in the back fork ends, it is only a question of loosening up a screw and sliding a small pinion or spur wheel slightly up and down the chain stays.

I am very pleased indeed to see that Mr. George Wray, of Southport, has designed fittings for driving a speedometer off the rear wheel, and he is certainly to be congratulated. I would only suggest, however, that he endeavour to attach his mechanism so that the transmission shaft takes a more horizontal position rather than a vertical one where it leaves the rear wheel. Personally, I find the top frame tube position for the dial the ideal one.

W. H. WELLS.

The Price of Motor Cycles in New Zealand.

Sir,—The question of the prices charged for motor cycles in New Zealand is a matter I desire to bring under your notice in the hope that representations will be made in your journal to manufacturers to see that residents in the Dominion have a chance of securing machines at, say, English prices plus importing charges. I cannot see why we in New Zealand should have to pay £87 10s. for a three-speed Triumph when the same make can be bought in the retail shops in England for £59 10s. Most of the principal makes cost in New Zealand anything over £27 above English retail prices. An emphatic protest must be made against the operations of the so-called "sole agency" system, or rather, the evident results of the system. I believe there are many retail houses in New Zealand of assured financial standing who would be prepared to sell motor cycles of well-known makes at English retail prices plus landing charges if they were permitted to deal with manufacturers direct. But what are the actual facts? "Sole agencies" are held by two or three big firms, and controlling practically the best English makes, the selling prices are fixed at a scale which a very large number of motor cyclists and would-be motor cyclists consider excessive. But possibly the "sole agencies" are not altogether responsible. It is said, and I believe the statement to be correct, that the home manufacturers sell their output to the "sole agencies" through London agents. If such is the case it is quite evident that the poor New Zealand motor cyclist has to contribute quite a large sum for the support of a system which the manufacturers have in their power to abolish, almost, if not entirely.

Could not the Manufacturers' Union consider the question with a view to further popularising the pastime in the Dominion by arranging for the elimination of unnecessary agency charges from the prices which we in New Zealand have to pay for motor cycles at the present time?

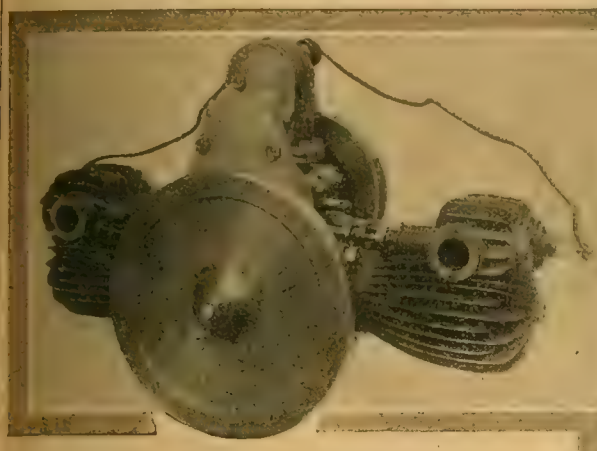
The inevitable disclaimer. I have no connection whatever with the trade. NORMAN R. WILLIAMS.

Clothing for Doctors.

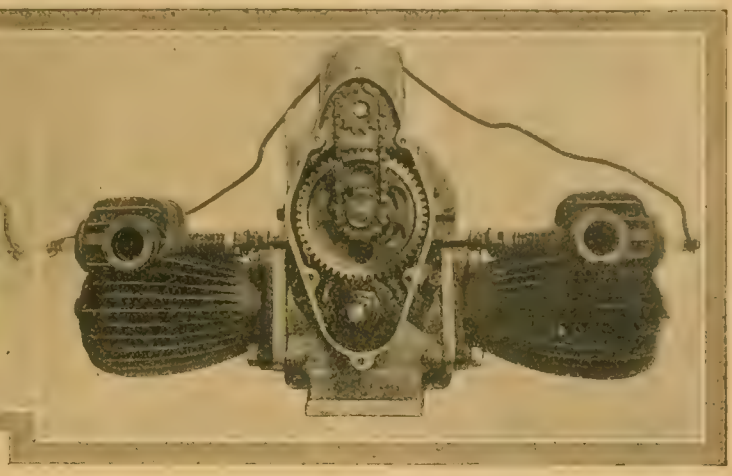
Sir,—Let Dr. Gaskell try a College mudshield and leave all gaiters alone as I do. He will then be able to ride dry and clean, with no need to dirty hands, etc. I had some spring leggings made twelve months ago, and much prefer a mudshield. Of course, I must admit that when touring or going for a long ride I use overalls, but where there is time for the engine to cool I always use the shield. I find the engine heats up slightly, but never to do harm. With a clutch model I fail to see the necessity for any outrageous garb. I wear the ordinary threequarter coat and never feel unprofessionally dressed. YORKSHIRE.

A New Horizontal Twin.

Features: 688 c.c. Valves over Engine, Camshaft Drive, and Half Compression Device.

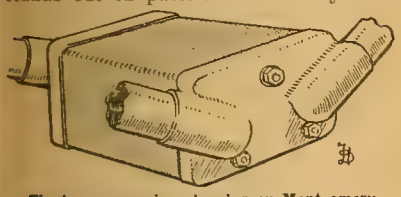


Flywheel side of Montgomery engine.



Timing gear and magneto drive with casing removed.

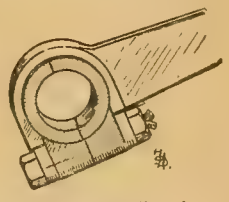
IT will come as news to most of our readers that W. Montgomery and Co., of sidecar fame, are shortly to market a motor cycle fitted with a horizontally opposed engine of 688 c.c. The machine has several features of considerable interest, among which the 7in. belt pulley, fitted on the camshaft, stands out in particular. The cylinders



The large expansion chamber on Montgomery engine.

are placed directly opposite to one another, and have a bore and stroke of 75×78 mm. The cooling ribs are longitudinal, and are pear shaped. Each piston has two stepped rings, the gudgeon pin being held in position by brass end cages. The design of the big end bearings is unusual, as only one bolt is used to secure the two halves of the split bush (the construction may be clearly seen from the accompanying sketch). Lubrication is by splash, a certain amount of oil finding its way into the camshaft casing and being led down by ducts to the pistons. An outside flywheel is fitted on the off side of the engine, while on the near side a pair of very substantial gear wheels drives the solid camshaft. Both crank and camshaft run on Skeffko ball bearings, and, as before mentioned, the final drive is taken from the camshaft. The valves are placed above the cylinders and lie horizontally, and are operated by a simple arrangement of rockers. These rockers have a very large contact surface, and are suspended from a bar which crosses at right angles to the camshaft slightly above it, thus by partially rotating the bar the rockers are shifted sideways on to special half compression cams. The magneto lies directly above the camshaft, and is driven from it by a short roller chain.

The suspension of the engine is novel, the base chamber being carried on two short horizontal tubes which are bolted to the main frame, two bolts only being necessary for fixing or removal. The down tubes from both steering head and saddle pillar are forked and pass round the cylinders, the heads of which thus project somewhat. The frame has a dropped top tube, and the tank is held from below. As regards equipment, the machine is still in the experimental stage, so that it is not yet safe to give further details, except that an Armstrong Mark VII. gear will most probably be fitted. The machine has been designed for sidecar work, and will have a top gear ratio of approximately 5—1. It is constructed on sound lines, and we are looking forward to a road trial at no very distant date.



Unusual construction of split big end bearing.

THE MIDLAND RELIABILITY TRIAL.

Sutton Coldfield Club unseat many Competitors on Newly-discovered Test Hills.

ONE of the last of this year's busy competition programme was the Sutton Coldfield and Mid-Warwickshire Automobile Club's open non-stop reliability trial last Saturday. Several special awards were offered, and the entry list totalled 102, including many T.T. riders, though Jack Marshall, the old Triumph rider, whose name appeared on the entry list, failed to put in an appearance. This event was not under the Manufacturers' Union support, and consequently the trade was only partly represented. A Sunbeam team was entered inadvertently, but was subsequently scratched, as the members of the Manufacturers' Union, it may be remembered, formed a compact to support only those events specially selected. The start was made at 8 a.m. in dull weather from the Midland Wheel Club's quadrangle in Swallow Street, Birmingham.

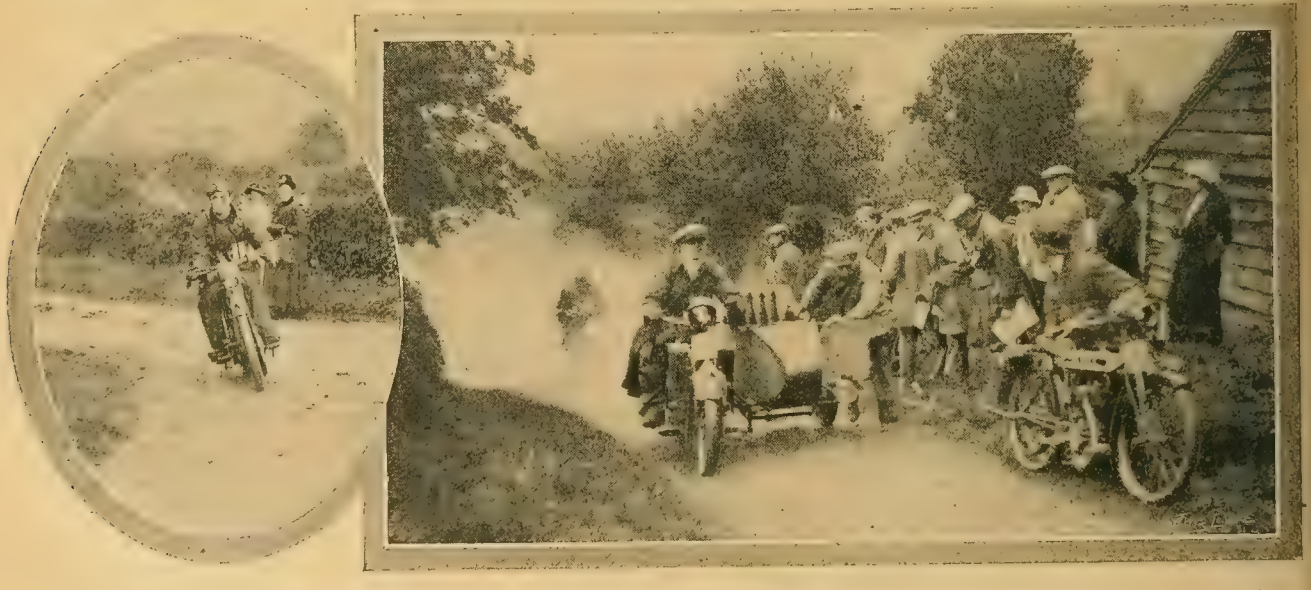
Beacon Hill, the first rise of note on the 125 miles course, was nine miles away. The gradient does not exceed 1 in 8, but the thick clayey surface rendered riding tricky at times, though the failures could hardly be excused. However, a dozen thus early lost any chance of an award. It may here be interpolated that a long standing rule of the Sutton Club is a blank sheet for any rider who stops from whatever cause, consequently most ripped their numbers off as soon as they were out of it. T. C. A. Wright (Douglas) stopped alongside us, his flapping coat having been sucked over the air inlet of the carburetter and upset the mixture. Kerr (N.S.U.) was overgeared, Jones (Morgan) stopped near the top, Macdonald (Norton) came up with his gear making weird noises and then skidded completely round. Reg Holloway, who was making his first appearance on a Morgan runabout, almost collided with a milk-cart which was being trotted round a blind corner. Hands (Calthorpe c.c.) evidently believes in rushing a hill, for he dashed up to the corners and tore up the gradient passing motor cyclists on his way. Mortimer, on a similar light car, passed with the water of his radiator boiling and the number plate trailing.

The Performances on Flagstaff Hill.

In Bromsgrove, Whitworth (Douglas) retired with engine trouble, Francis (Lea-Francis) and R. W. Duke (Rover) punctured, and so the ranks were gradually thinned.

Ankerdine was the second test hill, but again it was not sufficient to worry the experienced riders, though ten miles further on a real surprise in Flagstaff Hill, Abberley, was encountered. This ascent is narrow and twisty with an indifferent surface, sometimes rather grassy, but in no sense too difficult for a modern touring motor cycle. A surprising number failed on this climb, though, of course, the extremely slippery surface had much to do with this result. J. St. John, the trials honorary secretary, on a Scott, skidded. Burney (Blackburne) slewed from one side to the other, but neatly recovered. Applebee (B.S.A.) fell and thereby slightly impeded T. Silver's Quadrant sidecar, though the latter avoided the obstacle very neatly. Charlie Collier's only trouble was to keep the back wheel of his 1914 7 h.p. Matchless sidecar down; he had any amount of power. Good climbs were made by H. A. Collier (Matchless), L. W. Guy (Scott), H. Greaves (Enfield sidecar), and Bird and Barrett on Rudges. Dudley's little Hobart came over the steepest pitch of about 1 in 5 at a surprisingly fast speed, then his front wheel caught a big stone projecting through the ground and he skidded completely round. Littledale (Ariel) touched with his foot simply to keep his machine upright, H. Silver (Quadrant)

The trials hon. sec., James St. John (3¾ h.p. Scott), being started by Mr. Alec Ross.



L. A. Bees (L.M.C.) on the lower portion of Flagstaff Hill. An idea of the melee on the steepest stretch of Flagstaff Hill, which was in a very greasy state.

H. Greaves (6 h.p. Enfield sidecar) crossing the tape which denoted the finish of the slow section and start of the fast in the flexibility test.

suddenly found himself in the ditch, whilst Moss (B.S.A.) and Lovegrove (Ivy) came to a standstill. Mundy and Noble (his passenger) ran alongside the Williamson of London-Edinburgh fame, due, it was subsequently discovered, to the wrong type gear box with high ratios having been fitted. Busby's Williamson sidecar got up well. Glassey (Quadrant sidecar) was baulked, so turned round to have another ascent, when his machine got out of hand, and only after an exciting wrestle was its mad career checked. Then followed quite a crop of failures, so many, in fact, that one had no time to study why they occurred, as the remarkable thing is all had successfully accounted for the steepest stretch. We formed the opinion that it was due to using too much power on the greasy surface instead of closing the throttle as soon as the easier section was reached. J. S. Watson (Sunbeam), A. H. Johnson (Allday), L. Hadley (Enfield), Cuffe (Premier), and Dixon (Singer) were among those who, having sailed merrily past the observers, suddenly found their back wheels shoot from under them. One or two went through the hedge, Rowlandson (Rudge) among them, whilst Waddington (Campion) was bunkered in a ditch a foot deep; the "Sutton Slide," Mr. Holroyd, of the Rudge Co., christened it.

Most of the older hands were more ready for emergencies and snapped up their valve lifters immediately there was a suspicion of a skid. North (Ariel) did particularly well, also Ball (Triumph), Taylor (Connaught), and D. M. Brown (Rover). Davies (Diamond) and Lee (B.S.A.) were baulked by a Calthorpe and a Clyno stuck side by side on the hill, but made no mistake when they got a clear course. The same remarks apply to R. E. Guest (Matchless sc.). The 10 h.p. Calthorpe, driven by Hands, again impressed the spectators, though Mortimer's car had much less power in reserve. Nott seemed to have no control over the steering wheel of his Clyno and skidded into the ditch. A piece of smart driving was when T. Stevens (3½ James sc.) came up and carefully crept his way around a cycle car with only inches to spare, and got up comfortably.

The course thereafter was rather twisty to Newnham and Cowley, and included three watersplashes. (*En passant*, we desire to contradict the rumour that clubs have secretly put their heads together under the *ægis* of the A.C.U., to develop a motor cycle waterplane for trips to the Isle of Man.) Ludlow was the luncheon stop. Here, F. Smith told us he had konked out on the level and drew our attention to a patch of lubricating oil of doubtful colour and with black streaks he had drained out of his crank case.

The chief event of the afternoon was the flexibility test on Whitback Hill. Competitors could select the gear they would use for both slow and fast tests, officials sealing the gear lever at the hill foot. It was much the same as in the Six Days Trials on Warnell Fell, except that the length of the slow test was as long as the fast stretch, the result being determined by dividing the slow speed into the fast, which formula favoured those who could run very slowly. Coursing from one side of the road to the other was permitted and thus somewhat destroyed the value of the test. It was clear that the riders were not willing to run the risk of losing an award by travelling too slowly, Lea (Lea-Francis) appearing as slow as anybody. Newey's Ariel showed remarkable flexibility, also the two 7 h.p. silent running Indians. Rem Fowler's long stroke Norton was both slow and fast, Lane (Rex-Jap), Lovegrove (Ivy), and Close (Triumph sc.) stopped altogether, whilst Egginton (Enfield sc.) must have made his passenger almost seasick,

R. Holloway (8 h.p. water-cooled Morgan) on the sharp bend on Farlow Bank.

Two competitors rounding the acute bend on Farlow Bank. There were comparatively few failures here.

as he twisted from one side to the other. Gibb (Douglas) was another who wormed his way up the hill.

The 4¼ h.p. Star sidecar handled by J. L. Bradford showed really wonderful flexibility in the slow test; it was possible to count the explosions of the engine. Dudley made amends for his fall by demonstrating the controllability of his 290 c.c. Hobart, accelerating better than many 3½ h.p. riders.

An Old Favourite.

The only real hill of the afternoon trip was Farlow Bank, the hill included in the A.C.U. Autumn Quarterly Trial of 1910, and which caused a big percentage of failures. On Saturday, however, there was naturally a most marked improvement, failures being the exception. There was excitement for the crowd of spectators, however, right from the first. Davison (2¾ Sunbeam) and C. Allison (Scott) were approaching the hairpin bend together, when the latter decided to shoot ahead, but, over-estimating his speed on the bend, skidded, and shot up a 1 in 2 bank, scattering a crowd of boys at that point. Mrs. Riley was clapped for the masterly manner in which she handled her Enfield. Bollack (Singer) and Gregson (Bat) were slow but sure. Gibb (Douglas) good. Greaves (Enfield sc.) fast. Fowler (Norton) eased his clutch but got up well. Bird (Rudge) again showed up well. Roberts (Blackburne) cut in too near the corner and his back wheel dropped into the ditch; he kept his engine running, however, and restarted. Cocks coolly stepped off his Connaught and walked alongside for a dozen yards and then just as coolly remounted. Proctor, who was similarly mounted, got almost to the top. Mortimer (Calthorpe) stopped after the corner with his water boiling, which left Hands winner of the P. J. Evans cycle car trophy. The Clynos all showed up very conspicuously, which, incidentally, is becoming quite a stock phrase. Milner (Levis) stopped on the crest of the hill. Hands dashed up to the corner rather recklessly, skated about, but got up in fine style. Macdonald (Norton) caused amusement by hugging the outside of the corner and picking his way up very coolly, whilst H. G. Dixon and Pollock, on the twin Jameses, both made very neat climbs along with Longton (Alldays).

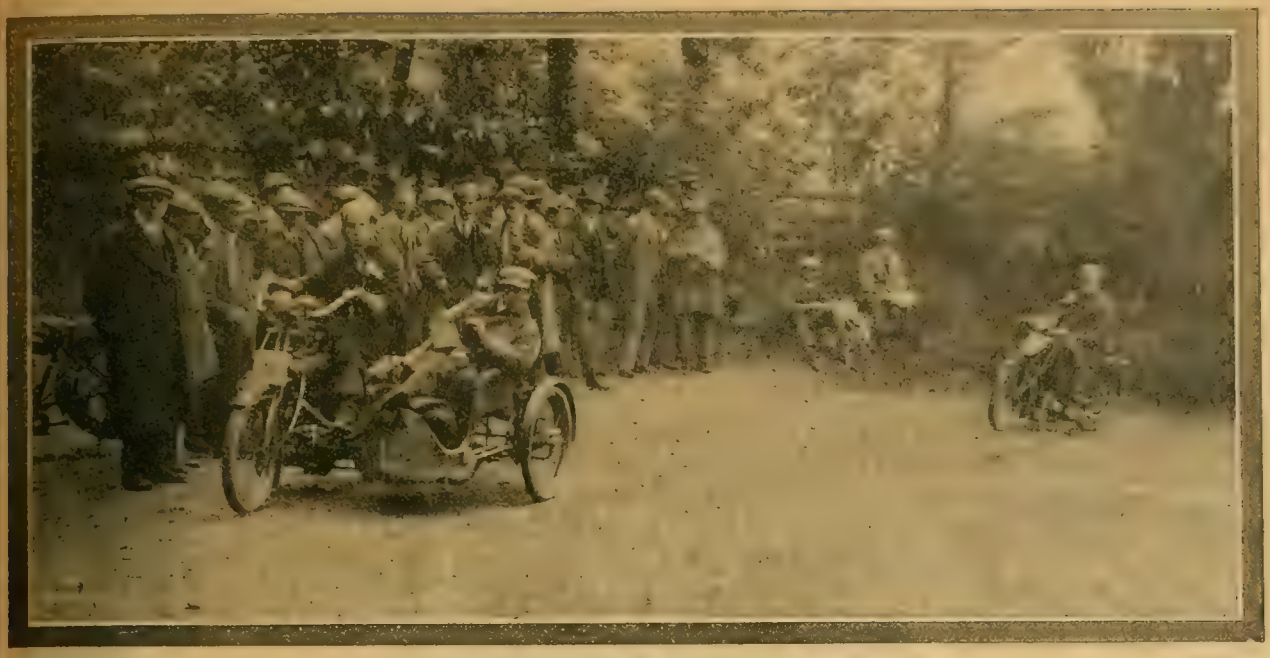
Thereafter the route lay through Bewdley and Kidderminster over easy roads to the finish, where a goodly crowd had assembled. A piece of hard luck was when Bollack stopped for the first time through shortage of petrol but three miles from home.

Analysis of the Trial.

There was no delay in announcing the provisional results, thanks to complete arrangements, characteristic of the Sutton Coldfield Club. Each test hill was in charge of a chief observer, whose duty it was to collect all the other reports and condense them for the committee.

An interesting analysis of the trial is given below:

	Motor cycles.	Sidecars.	Cycle cars.
101 entries ...	70	23	8
94 started ...	66	22	6
33 non-stops ...	23	8	2
17 gold medals ...	10	6	1
16 silver medals ...	12	3	1



THE FLEXIBILITY TEST ON WHITBACK, NEAR LUDLOW.
J. L. Bradford (4½ h.p. Star sidecar) and J. S. Watson (3½ h.p. Sunbeam) finishing the slow section. The last named made the best performance in this test.

The Probable Winners.

L. W. Guy (3¾ Scott) is the most likely winner of the Levis Cup. He was third in order of merit in the flexibility test, with 1m. 26⅖s. slow and 44⅖s. fast, giving a formula result of 1.94. The two riders who beat him do not qualify for gold medals, as they were late at Ludlow. The best performance of all in the flexibility test was by J. S. Watson on a Sunbeam, who took 1m. 50⅕s. slow and 49⅕s. for fast stretch = formula 2.24. W. B. Gibb was second on a Douglas, with 1m. 34⅕s. slow and 48s. fast = formula 1.96.

The P. J. Evans cycle car trophy will go to G. W. Hands (Calthorpe), who was the only cycle car driver to gain a gold medal.

Although Norman Lea (Lea-Francis) does not appear on the provisional list of gold medal winners, his name will no doubt be included, as he was wrongly reported by an official as stopping in the flexibility test.

GOLD MEDALS.

G. S. Davison (2¾ Sunbeam)	G. W. Hands (10 Calthorpe c.c.)
Mrs. Riley (6 Enfield sc.)	C. Taylor (2½ Connaught)
C. R Collier (7 Matchless sc.)	J. W. Woodhouse (5-6 Clyno)
L. A. Bees (4 L.M.C.)	W. H. Longton (3½ Alldays)
W. H. Egginton (6 Enfield sc.)	R. E. Guest (8 Matchless sc.)
L. Newey (3½ Ariel)	G. Featherstonehaugh (3½ Rover)
L. W. Guy (3¾ Scott)	E. V. Pratt (3½ O.K.-Precision)
R. Pearson (5-6 Clyno sc.)	T. Stevens (3½ James sc.)
H. G. Dixon (3½ James)	

SILVER MEDALS.

G. A. Gregson (6 Bat)	R. Holloway (8 Morgan runabout)
R. Haddock (5 Clyno sc.)	J. S. Watson (2¾ Sunbeam)
C. S Burney (3½ Blackburne)	T. Pollock (3½ James)
H. A. Collier (3½ Matchless)	C. Freeman (5 Clyno sc.)
H. Greaves (6 Enfield sc.)	F. C. North (3½ Ariel)
H. V. Colver (3 Enfield)	H. Ball (3½ Triumph)
W. B. Gibb (2¾ Douglas)	B. W. Lee (3½ B.S.A.)
L. L. Sealey (3½ B.S.A.)	D. M. Brown (3½ Rover)

A.C.U. BROOKLANDS CHAMPIONSHIPS.

The B.M.C.R.C. will have a busy programme next Saturday at Brooklands. Before lunch there will be the Third 1913 Time Trials, followed by the One Hour Cycle Car Race and the One Hour Sidecar Race. In the afternoon there will be held the Junior One Hour A.C.U. Championship Race for machines up to 350 c.c. for the Auto Challenge Cup and A.C.U. Gold Medal. Event V. will be the A.C.U. Championship Race for machines up to 1,000 c.c. for *The Motor Car Journal* Challenge Cup, and the Senior One Hour Championship Race for machines up to 500 c.c. for *The Motor Cycle* Challenge Cup. These three Challenge Cups were presented to R.A.C. before the founding of the A.C.U. in 1900. The One Hour 500 c.c. race for *The Motor Cycle* Cup has received the largest support with twenty-five entrants. The sidecar race, too, has drawn a fine field. The new 3½ Douglas and a special Douglas with overhead valves are among the new machines entered.

THE NORTH WALES TRIAL RESULTS.

The Liverpool Auto Cycle Club at the beginning of this week issued the results in connection with the above event, held on the 27th ult. They appear below :

SPECIAL AWARDS.

The Reliance Cup and the club gold medal.—J. B. Sproston (2¾ Sunbeam).

Best single-geared performance.—C. T. Newsome (3½ Rover).

Best amateur solo performance.—R. P. Ravenhill (3½ Rover).

Best amateur sidecar performance.—W. Court (6 A.J.S. sc.)

Best amateur lightweight performance.—J. B. Sproston (2¾ Sunbeam).

Club team and Manufacturers' team.—No team complied with the requirements.

GOLD MEDALS.

W. Heaton (2¾ A.J.S.)	Hugh Gibson (6 Bradbury sc.)
W. Court (6 A.J.S. sc.)	H. C. Marston (3½ Triumph sc.)
J. B. Sproston (2¾ Sunbeam)	

SILVER MEDALS.

G. Wray (5-6 Clyno sc.)	R. Pearson (Clyno sc.)
F. G. Edmund (3½ Humber)	V. Busby (3½ Sunbeam)
O. Wade (6 A.J.S. sc.)	W. H. Longton (3½ Alldays)
T. C. de la Hay (6 Sunbeam sc.)	L. A. Bees (4 L.M.C.
D. H. Noble (3½ Rover)	C. Freeman Clyno sc.)
C. E. Nokes (3½ Sunbeam)	A. J. Stevens (A.J.S. sc.)
G. Featherstonehaugh (3½ Rover)	

BRONZE MEDALS.

E. F. Baxter (6 Rex.	S. Sawer (3½ Premier)
C. T. Newsome (3½ Rover, s.c.)	S. T. Tessier (6 Bat
A. J. Dixon (3½ Singer)	H. Newey (2½ Levis
L. Guy (Scott)	A. W. Brittain (3½ Bradbury)
D. Bradbury (4 Norton sc.)	J. S. Watson (2¾ Sunbeam)
J. A. Dudley (2½ Hobart)	G. A. Gregson (5-6 Bat
V. E. Horsman (3½ Singer)	R. P. Ravenhill (3½ Rover)
Frank Smith (Clyno sc.)	L. Mogridge (2¾ Mead)
L. Park (2¾ Douglas)	S. Wright (8 Humberette)
Rex G. Mundy (3½ Triumph)	H. F. S. Morgan (8 Morgan)

Motor Cycle Racing at Brooklands.

THERE was some excellent racing at Brooklands last Saturday, one of the cars, the twelve-cylinder Sunbeam, averaging no less than 118.58 miles an hour during one lap. We wonder when a motor bicycle will be made which will equal this speed, and who would be found to ride it. The two motor cycle races in the excellent programme were spaced far apart. The first, at 2.25 p.m., was the Seventeenth Short Handicap, for which thirty-nine entries had been received. Prizes: First, £10 or cup; second, £5 or cup; third, £3 or cup. There were only six non-starters. Among the machines ranged up by Mr. H. P. Beasley in the paddock in two rows we noticed Allen's Douglas, which was fitted with two microscopic tanks, one for petrol and the other for oil. D. C. Bolton was riding a Douglas for the first time, which was brand new. Among the absentees was Emerson's A.B.C., the performance of which many people were looking forward to see. At the start by the fork Cocker (Singer) arrived at the last minute owing to having suffered from a sooted plug after leaving the paddock. All the men got away well except O'Donovan, whose Norton, which he has been showing to such good advantage lately, was decidedly off colour. In the course of the race the competitors had to pass the fork once and then enter the straight. The order of the leaders past the fork was as follows: Elwell, Bolton, Buckeridge, E. C. Stanley, Williams, Newman, Jacobs, Le Grand, Edmond, Heaton, Miller, Haswell, Buchanan, Hellaby, Pullin, Cocker, P. Fletcher, Openshaw, etc. Williams (A.J.S.) led at the beginning of the straight, and was then passed by Pullin and Hellaby, who had a struggle for first place. Pullin won by about a dozen yards, Williams being about 156 yards behind Hellaby. Williams was followed by a long procession in close order. Pullin's speed was 68¾ m.p.h. Results:

		Bore and stroke.	c.c.	Start. m. s.
1.	C. G. Pullin (1-cyl. Rudge) ...	85 ×88	499	26
2.	J. A. B. Hellaby (2 Indian) ...	82.5 ×93	994	26
3.	C. Williams (1 A.J.S.)	74 ×81	348	1 16
	H. C. Newman (1 Ivy) ...	70 ×90	346	1 6
	J. Cocker (1 Singer)	85 ×88	499	34
	E. L. Buchanan (2 Imperial) ...	70 ×64.5	496	54
	J. R. Haswell (1 Triumph) ...	85 ×88	499	54
	A. G. Miller (1 Martin) ...	90 ×77.5	493	54
	E. E. Elwell (2 Douglas) ...	61 ×60	350	1 26
	L. Hill (1 Rudge)	85 ×88	499	26
	D. C. Bolton (2 Douglas) ...	61 ×60	350	1 36
	F. G. Edmond (2 Humber) ...	60.75 ×60	348	1 16
	W. D. Hawkes (1 Ixion) ...	85 ×88	499	40
	A. L. Pullin (1 Rudge) ...	85 ×88	499	40
	W. H. Buckeridge (2 Douglas)	61 ×60	350	1 36
	E. C. Stanley (2 Douglas) ...	61 ×60	350	1 36
	S. Wright (1 Humber)	84 ×90	499	40
	E. N. Openshaw (1 Triumph) ...	85 ×88	499	54
	J. P. Le Grand (1 Singer) ...	69 ×93	348	1 16
	P. Fletcher (1 Indian)	82.5 ×93	497	40
	W. R. Jacobs (1 Singer) ...	69 ×93	348	1 16
	W. Heaton (1 A.J.S.)	74 ×81	348	1 16
	J. Scoffield (2 Blumfield) ...	67 ×95	670	6
	J. E. Bird (1 Singer)	85 ×88	499	54
	A. J. Luce (2 Zenith)	90 ×77.5	986	scr.
	A. L. Monger (1 Rudge) ...	85 ×88	499	40

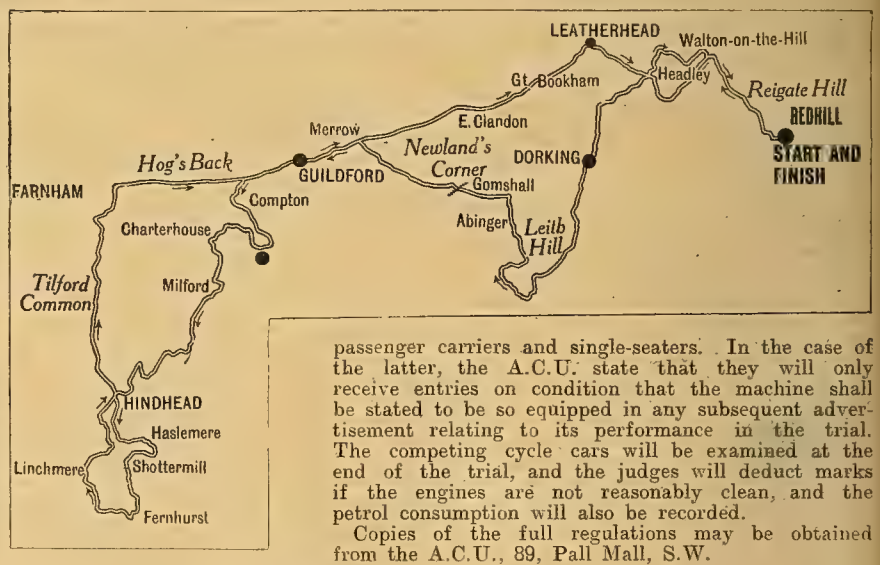
The next motor cycle race was the seventh in the programme, and was down for 4.30. This, however, was not run off, as a heavy shower, which began at 4 o'clock, caused the rest of the meeting to be postponed.

A.C.U. CYCLE CAR TRIAL: MAP OF THE COURSE.

THE Auto Cycle Union have issued the rules for the one day cycle car trial, which is to be held on Wednesday, October 29th, starting and finishing at Redhill. The course will be about 100 miles in length, and almost entirely in Surrey. No freak hills are included, and the route appears to be over very fair give and take country, including a few sharp rises, but nothing that any ordinary tourist should not be able to climb in the course of an average day's run. No trial will be held unless there is a minimum entry of twenty-five, and entries will be received by the Union up to Saturday, October 18th.

The rules framed for this event are quite simple, and provide for the inclusion of three-wheelers, whose cubic capacity is limited to 1,000 c.c., and for four-wheeled vehicles up to 1,100 c.c. The usual A.C.U. weight definition is adopted. There are two classes, A and B, for three and four-wheeled machines respectively, and these classes are each sub-divided into passenger carriers and single-seaters. In the case of the latter, the A.C.U. state that they will only receive entries on condition that the machine shall be stated to be so equipped in any subsequent advertisement relating to its performance in the trial. The competing cycle cars will be examined at the end of the trial, and the judges will deduct marks if the engines are not reasonably clean, and the petrol consumption will also be recorded.

Copies of the full regulations may be obtained from the A.C.U., 89, Pall Mall, S.W.



SPEEDOMETERS DRIVEN OFF THE ENGINE.

IT'S a cruel world, my masters! When I let fall words of profound wisdom, no kindly soul writes to praise and encourage me. But when I am overcome by one of those fits of temporary insanity which periodically overtake all great men from Solomon down to Isaac Newton and Ixion, every motor cyclist in the kingdom (and there are now over 100,000 of them) writes or wires or 'phones two hours after publication to jeer at my folly. I gave these hard-hearted cynics a glorious opportunity last week, when I had been musing over a T.T. machine, and considering how much nicer it would be if its speedometer were driven off the magneto chain sprocket. Obviously, this brilliant suggestion would be worse than useless for any machine except a single-geared chain driver. Consider what fearful results would flow from its adoption. Anybody late at a control in an A.C.U. trial would merely run the speedometer on free engine for five minutes, and then inform the judges that the section was eighty miles longer than the card indicated. Any hireling of the tyre companies who desired to compose a veracious and astounding testimonial would merely do about three laps of Brooklands on bottom gear, and then write to the makers and say his cover had done 20,000 miles, and still looked better than new. I must have meant that par for the Christmas number. IXION.

1914 N.S.U. Twin-cylinder Models.

OUR illustration shows the first of the 1914 model 6½ h.p. N.S.U. motor bicycles on the road. It will be seen that it comprises several features which, up to the present time, have been foreign to N.S.U. practice. The drive is by Hans Renold chains, the front chain being entirely enclosed and the back chain half enclosed. The gear box is of the counter-shaft type, and contains three speeds. Footboards are also fitted, while conspicuous in the photograph is to be seen a kick starter. The bore is 75 mm. and the stroke 94 mm., 830 c.c. This model will be fitted with 26in. × 3in. tyres.

A similar model will be the 7-9 h.p., 80 mm. × 99 mm., 995 c.c., which will be fitted with 28in. × 3in. tyres. Other features which will be common to the two models will be Ferodo-lined rear brakes and mechanical lubricator delivering oil through a sight feed.

The latest pattern 6 h.p. N.S.U. which is fitted with chain drive and counter-shaft three-speed gear.

MOTORING FOR THE MILLION.

Recently there appeared in the *Daily Mail* some remarkable figures taken from motor registration authorities. The fact we glean from this information is that every month nearly 1,500 more cars and motor cycles are registered throughout the British Isles.

The total increase in the number of cars and motor cycles registered this year up to September 29th, as compared with the same period last year, is as follows:

	1912.	1913	Increase.
Motor Cycles	34,878	40,767	5,889
Motor Cars ...	32,953	42,288	9,335

Below is given a list of the numbers of motor cycles registered in many of the most populous districts from Jan. 1st to Sept. 29th, 1912 and 1913.

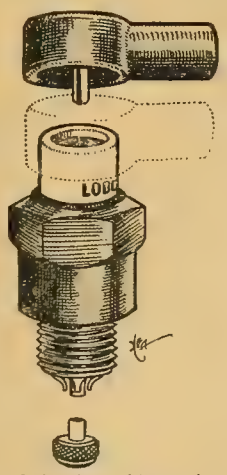
	1912.	1913.	Increase.
Manchester ...	812	865	53
Bristol ...	1,516	1,899	383
Surrey ...	851	1,034	183
Essex ...	777	873	96
Kent	865	1,081	216
Derbyshire ..	1,413	1,800	387
Leicestershire	1,016	1,290	274
Southampton	489	519	30
Belfast ...	797	982	185
Liverpool ..	630	673	43
Lanarkshire ..	690	967	277
Edinburgh ...	1,045	1,399	354
Coventry ...	2,309	3,015	706
Wakefield ...	713	751	38
Bolton ...	510	654	144
Dublin ..	239	280	41
Herefordshire	443	615	172
Huddersfield	353	443	90
London ...	3,251	3,721	470

It will be noted that the Coventry figures are high. This is due largely to firms registering motor cycles for their owners, so that their machines are ready for the road when they leave the works.

The London County Council figures are only available up to August 1st in each year. In the area covered by the Council, the total number of motor cars registered to June last was 65,257, and the number of motor cycles with and without sidecars was 25,831.

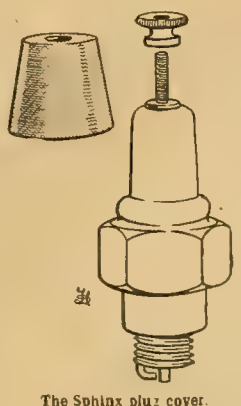
WEATHER-PROOF PLUGS.

The new type of Lodge plug with weather-proof terminal is most excellent in design. In the first place, it will be seen that the top of the sparking plug is fitted with a special plug connection so that the high tension wire is instantly attached without having to be screwed on. It is perfectly insulated so that the wire can be detached when the engine is running, if such a course is thought to be desirable. Moreover, the end of the wire is supported by the terminal itself, and in consequence there is no danger of the wire breaking off. The special terminal also absolutely protects the porcelain from being shorted by means of wet or mud.



Lodge plug and terminal. At the bottom is seen the gauge for the distance between the points.

The whole device has been most cleverly thought out, as the insulation of the terminal overlaps the steatite insulator of the plug, and thus the perfect protection of the plug is effected without increasing its height. The plug used is of the three-point pattern, the three points being separated from the central electrode by means of a special gauge, which, when withdrawn, leaves the gap correct.



The Sphinx plug cover.

The Sphinx Manufacturing Co., of Bradford Street, Birmingham, are marketing a plug cover which will be known as the Plug-protector. It is designed to be used with any make of plug and to protect the insulator from mud, rain, oil, etc. The cover is heat proof, being made of an asbestos compound, and is neatly constructed.

TIME TO LIGHT LAMPS.

British Successes in Spain.

In a recent motor cycle race in Spain between Mercadillo and Cortederra English machines were well to the front. The winner rode a Bat, second a Douglas, third and fourth Rudges.

A Comprehensive Issue.

This week we follow up our description of the new 3½ h.p. Douglas with the new Montgomery horizontal engine, especially intended for sidecar work. The engine possesses many interesting features.

The first of the new N.S.U. three-speed counter-shaft geared mounts is also dealt with, an improved Rotherham pilot jet carburetter, a mechanical lubricator, the 1914 pattern 7 h.p. Matchless sidecar outfit, and a four-cylinder friction driven cycle car, to sell at approximately £100, the new Douglas cycle car, an American belt driven four-wheeler, and Williamson sidecar improvements.

The 500 c.c. Hour Record.

There are rumours of early attempts on the one hour motor bicycle record which has stood so long to the credit of G. E. Stanley. One of the most likely to annex the record is D. R. O'Donovan, who has got his 3½ h.p. 490 c.c. Norton tuned up almost to perfection. He can lap regularly at over 70 m.p.h. The latest Rudges from the works, too, are much faster, and an attempt on one of these mounts is not unlikely. There was a strong rumour in the Midlands last week that A. G. Fenn had actually captured the record on a B.S.A.

The Coventry Hill-climb.

The rendezvous for the Coventry and Warwickshire Motor Club hill-climb on Saturday next is the Red Lion Hotel, Banbury, where the weighing will take place, and a notice posted giving the name and position of the hill. Among the representative entry, numbering about 130, are J. R. Haswell, Cheshire, and Crawley on Triumphs; A. A. Scott and "Tim Wood" on Scotts; T. Silver (Quadrant), F. C. North and L. Newey (Ariels), H. F. S. Morgan (Morgan runabout), a number of Rudge riders (this firm's best known representatives will be at Brooklands), Geo. Griffith (Zenith), de la Hay (Sunbeam), C. T. Newsome and M. Orde (Rovers), and F. S. Whitworth (Douglas).

Programmes, sixpence each, may be obtained from *The Motor Cycle* Offices, Coventry.

High Diving on a Motor Cycle.

The cinema actor nowadays finds himself in many curious situations, but a photograph we reproduce must have provided the rider with a thrill, even greater than will be the lot of the audience who views it in the picture palaces. Mr. Harry Loraine, one of the actors employed by the British and Colonial Kinematograph Co., Ltd., during the course of the construction of a drama entitled "In the Villain's Grip," had to ride into forty feet of water at a speed of 35 miles an hour from a height of twelve feet. Splendid practice for taking water-splashes, we should imagine, and even more exciting than climbing mountains, of which we have lately heard so much!

SPECIAL FEATURES:

ANOTHER HORIZONTAL TWIN ENGINE

SATURDAY'S MIDLAND RELIABILITY TRIAL.

POWER OF SIDECAR COMBINATIONS.

Alldays Light Car.

We hear that for the 1914 season the Alldays Midget will be fitted with a light four-cylinder engine.

New London Home of the Douglas.

Douglas Bros. have just acquired much larger London premises at 39, Newman Street, Oxford Street, W., next door to the Bosch Magneto Co.

Thirty-five miles an hour into Tilbury Docks for a cinematograph film!
(See accompanying paragraph.)

A Distinction for the C.T.C.

H.R.H. the Prince of Wales has become a member of the Cyclists' Touring Club.

A Wonderful Performance.

By averaging 62.76 m.p.h. for nine hours at Brooklands last week, the 10 h.p. Singer has accomplished the finest performance to date of any cycle car or light car on the track.

Not a Cycle Car.

The little four-cylinder De Dion, which is only just outside the cycle car limits, with an engine of 1,183 c.c., has made its appearance. A car in miniature exactly describes this interesting little vehicle.

One Day Trial for Cycle Cars.

The A.C.U. will be glad to hear the names of any gentlemen, not connected with the trade, willing to act as observers, on the occasion of the One Day Cycle Car Trial on Wednesday, October 29th, from Redhill.

The Sidecar Age.

One of the lady speakers at the Church Congress at Southampton, declared last week that "these are the days of the sidecar" and that "the days of women riding pillion were over." We agree with the speaker on the former point, but on the latter she is not on such certain ground. But, doubtless, she was referring to a horse pillion.

Well Known Rider's Plans.

Harry Bashall, whose riding feats on the track and road are so well known, writes us that he is recovering rapidly from the severe accident to his knee which he sustained some months ago. His plans for the future include driving a Morgan in the M.C.C. London-Exeter Christmas run, when, he says, his brother Aubrey will also be similarly mounted. He hopes to ride in the Senior T.T. race next year, and says he will probably be found on a Scott. His brothers also will take part in the race. He also says he is keenly looking forward to the projected cycle car race in the Isle of Man next September, for he has a penchant for the old course over which it will be decided, as he knows the road so well.

Opening for British Trade.

Recent activity has led to a noteworthy improvement in Egyptian roads, says *The Board of Trade Journal*, and consequently there is a large demand for every description of motor vehicle, especially motor cycles. According to statistics issued by the police authorities of Cairo and Alexandria the number of motor cycles registered at the dates indicated were as follows:

	Dec. 31st., 1911.	Dec. 31st., 1912.	June 30th, 1913.
Cairo	250 ...	364 ...	448
Alexandria ...	40	68 ...	109

The United Kingdom easily occupies first place as supplier of motor cycles to the Egyptian market, all the leading makes being represented at retail prices of from £55 to £80, according to make and power.

There would also appear to be an opening in Egypt for cycle cars at about £100 each.

FUTURE EVENTS.

Oct. 11.—Coventry & Warwickshire M.C Annual Open Hill-climb.
,, 11.—B.M.C.R.C. Meeting and A.C.U. Championships.
,, 18.—Herts. M.C.C. Open Half-day Trial.
,, 25.—Mersey M.C. Open Trial.
,, 29.—A.C.U. Open One Day Trial for Cycle Cars.
Nov. 7-15.—Motor Car Show at Olympia.
,, 24-29.—MOTOR CYCLE & CYCLE CAR SHOW AT OLYMPIA.

Stolen Machine.

A 1913 three-speed Triumph was stolen from the street in Watford last week. The frame number is 212661 and the right pedal is missing. The owner is Mr. R. Haines, 52, St. Albans Road, Watford.

Motor Cycle Found.

One of our readers informs us that a brand new motor cycle was left in a barn by the roadside on the night of September 27th near Sandhurst, Berks. It was taken to the Sandhurst Police Station.

Amulree Hill-climb.

On September 18th we mentioned that the Amulree hill-climb had been postponed partly on account of the accident to Mr. McGregor and the consequent difficulty of finding an efficient substitute. We regarded this as a well-merited compliment to Mr. McGregor, but Mr. Good, who, without our knowledge, had been meanwhile appointed hon. secretary *pro tem.*, imagines it reflects on his capability as a secretary. We cannot see how, though if Mr. Good thinks otherwise, it gives us great pleasure to assure him and our readers that our high opinion of his organising abilities was and is unshaken.

A.C.U. Subscriptions.

Prospective members are reminded that those who join the A.C.U. at the present time will have their membership covered until January 1st, 1915. For 5s. members this works out to the extremely moderate sum of 1d. per week, which is not excessive when the numerous advantages of the Union are considered.

Ride Cautiously.

We are requested by a correspondent to draw attention to the need for exercising extreme caution when passing through Romsey (Hants.), as that town not only abounds in very acute corners, but also a very dangerous bridge exists where it is quite impossible to see what is coming from the opposite direction.

Sunday Club Meetings.

We have received serious complaints of the nuisance caused by crowds of motor cyclists riding through villages about church time on Sunday morning with apparently no regard for the silencer regulations or the feelings of the public. It is this kind of thoughtless behaviour which makes motor cyclists so unpopular in many quarters, and we hope that this hint will be duly observed before strong measures are taken to put a stop to such practices.

Racing in Italy.

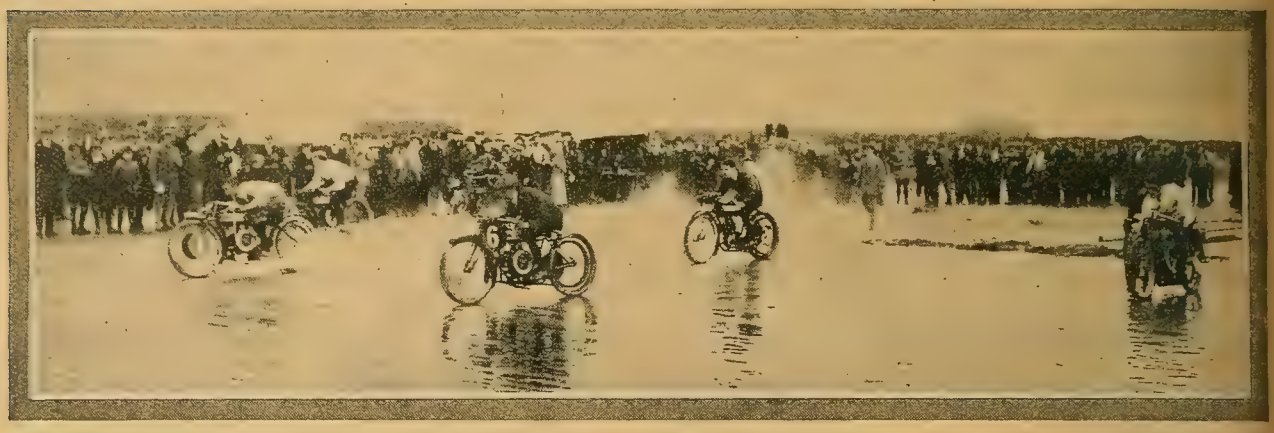
An important road race was held over the Circuito Umbro-Tuscano in Italy, the course of 230 miles including the famous ascent at Consuma. Both amateur and trade classes went to British machines, Tofanari Bindo on a Triumph being the first private owner in 6h. 18m. and A. Zan on a Triumph taking the trade prize in 6h. 38m. In the Roman race for the trophy, presented by *La Tribuna*, the Triumph trio took the team prize.

THE MIDLAND RELIABILITY TRIAL.

A. N. Barrett (5-6 h.p. Rudge Multi) and B. L. Bird (3½ h.p. Rudge) ascending Beacon Hill. The greasy state of the surface will be noted.

Racing on the Sands at Weston-super-Mare.

Bristol M.C.C. and Somerset A.C. Open and Closed Speed Trials.



Start of a heat for the first event for motor cycles up to 350 c.c. H. O. Springfield and H. K. Walker, both on 2¾ h.p. Douglases, get away well in the third heat.

SELDOM have appearances in general given more promise of a thoroughly enjoyable day than they did when we arrived at Weston-super-Mare on Saturday to witness these trials. The morning mists were just lifting—it was ten o'clock, but the early morning had been damp and foggy—and the sun was struggling to penetrate the grey cloak that enveloped the horizon, Brean Down, and the wooded heights behind Weston. A mile along the glistening sands we found the secretary and a number of stewards already on the scene, superintending the erection of tents, marking the course, etc.

The course, a mile in length, was marked off along the sands by coloured flags, and notices placed at frequent intervals requested the public not to walk thereon. There was a separate return route to the starting point, which enabled heats to be run off at three minute intervals, while a travelling marshal, who followed on the heels of the competitors in the last heats, took back the names of firsts and seconds who had to compete in the finals, to the starter. In the unlimited solo class first, second, and third competed in the final.

Torrents of Rain.

Only six heats had been run off when a drenching rainstorm came on, which lasted about ten minutes, and cleared the long promenade of its hundreds of spectators, and caused the postponement of the final of the 350 general class.

When racing recommenced the sands were in an appalling condition—slushy, and covered with rain puddles—and it was soon apparent that belt slip and plug troubles were rife among competitors, several of whom failed to stay the course in this and subsequent events.

The final of the Unlimited Capacity (General) Class was won by eight yards by A. James in fine style, and the chain-drive men smiled a knowing smile. P. Matthews (Rudge) romped home in the first heat of the 500 Sidecar Class, as did Moore (Rudge) in heat two, but F. P. Davies (Rudge) and Salway (Premier) had a very close contest for second place. The second heat of the Unlimited Sidecar Class provided the best sporting finish of the day, Griffiths overhauling Chapman, both on Zeniths, not thirty yards from the post. Rain now began again, and never ceased till the last of us had made his weary and dripping way from the course.

Two Machines are Pushed Home.

The first heat of the 1,100 Sidecar Class ended remarkably. McMinnies had an easy lead, when just three yards from the finish his Morgan jibbed, and defied all efforts to restart it. Meanwhile number two was creeping up, and McMinnies and his passenger made valiant efforts to push the machine over the line, and finally succeeded, just in time to secure second place.

Competitors travelling well in the final of Class II. Right—A. H. Alexander (Douglas) and left—P. H. Matthews (3½ h.p. Rudge) leading the field.

A FINE START. Start of Class IV. for 3½ h.p. sidecar machines.

In the second heat of this event, Cox's Morgan won easily, and the Douglas cycle car was third. In the final, Cox steered his lady passenger to another easy victory.

This was the last of the open events, but the club competitions provided some keen contests. In heat two of the 500 Class, P. Matthews (Rudge) was held up with plug trouble some distance from the finish, but bravely pushed his machine home, removed with difficulty the binding of insulation tape, and, after drying the plug, cut the bulb off his small bulb horn and used it as a plug protector. Returning to the start in fine style, he was able to bring off an easy victory in the final.

A Successful Meeting.

By about a quarter to three, the motor cycle events were over, and the cars followed on. Of interest to motor cyclists was the first awarded to W. Douglas (Douglas cycle car) in the 12 h.p. class. The striking feature of these events was the performance of various Talbot cars, though Miss Starkey showed up well with her Sunbeam

Considering the weather, it must be regarded as a successful day. The unusual conditions precluded any record breaking, whilst one can hardly take failures as evidence of incapacity on the part of machines or riders. Perhaps the most pithy description of the day was contained in a remark overheard in the official tent: "What an advertisement for plug-protectors!"

Final Results.

CLASS I.—Solo machines not exceeding 350 c.c., for single or twin-cylinder engines.

1. G. H. Fry (Douglas).
2. W. W. Douglas (Douglas).
3. E. Kickham (Douglas).

Fastest time, E. Kickham (Douglas), 1m. 15⅕s.

CLASS IIa.—Solo machines not exceeding 500 c.c., for single or twin-cylinder engines (generals only).

1. J. C. Moore (Rudge).
2. F. Woolstenholme (Triumph).
3. F. C. Davies (Rudge).

Fastest time, George Clark (Rudge), 1m. 14⅖s.

CLASS II.—Solo machines not exceeding 500 c.c., for single or twin-cylinder engines (experts only).

1. P. H. A. Matthews (Rudge).
2. A. H. Alexander (Douglas).
3. E. Kickham (Rudge).

Fastest time, P. H. A. Matthews (Rudge), 1m. 15⅗s.

CLASS III.—Solo machines (unlimited capacity), for single or twin-cylinder engines (experts only).

1. Geo. Griffiths (Zenith).
2. Byran Jeffreys (Zenith).
3. A. H. Alexander (Douglas).

Fastest time, Geo. Griffiths (Zenith), 1m. 14⅗s.

CLASS IIIa.—Solo machines (unlimitd capacity), for single or twin-cylinder engines (generals only).

1. A. James (Indian).
2. F. P. Davies (Rudge).
3. G. H. Fry (Rudge).

Fastest time, A. James (Indian), 1m. 14⅖s.

CLASS IV.—Sidecar machines not exceeding 500 c.c., for single or twin-cylinder engines. Passenger not under 132 lbs.

1. F. P. Davies (Rudge).
2. P. H. A. Matthews (Rudge).

Fastest times, H. Moore (Rudge) and F. P. Davies (Rudge), 1m. 38⅗s.

CLASS V.—Sidecar machines (unlimited capacity), single or twin-cylinder engines. Passengers not under 132 lbs. weight.

1. Geo. Griffiths (Zenith).
2. E. E. Chapman (Zenith).
3. A. B. Wade (Imperial-Jap).

Fastest time, Geo. Griffiths (Zenith), 1m. 19⅗s.

CLASS VI.—Cycle cars not exceeding 1,100 c.c. Passenger not less than 132 lbs. Sidecars barred, but three-wheeled cycle cars eligible. Passengers not exceeding 132 lbs. weight.

1. F. G. Cox (Morgan).
2. H. Morgan (Morgan).
3. W. G. McMinnies (Morgan).

Fastest time, W. G. McMinnies (Morgan), 1m. 47⅕s.

CLASS VII.—Club class, not exceeding 350 c.c., for single or twin-cylinder engines.

1. W. W. Douglas (Douglas).
2. G. H. Fry (Douglas).

Fastest time, W. W. Douglas (Douglas), 1m. 28s

CLASS VIII.—Club class, not exceeding 500 c.c., single or twin-cylinder engines.

1. P. H. Matthews (Rudge).
2. F. P. Davies (Rudge).
3. W. W. Douglas (Douglas).

Fastest time, G. H. Fry (Rudge), 1m. 27⅕s

CLASS X.—Club class, not exceeding 350, single or twin-cylinder engines, for members not having won a first in a speed trial or hill-climb, and not connected with the trade.

1. F. C. Wasley (Douglas).
2. J. King (Douglas).

CLASS IX.—Club passenger machine championship. Sealed handicap adjusted by the Editor of *The Motor Cycle*.

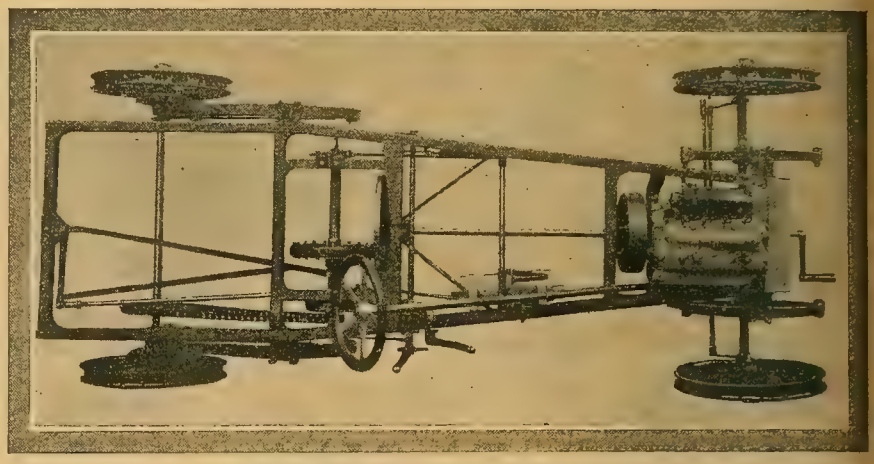
	m.	s.
1. G. H. Fry (Zenith sc.)	1	19
Less handicap time		3
Fastest time	1	16
2. F. P. Davies (Rudge sc.)	1	43⅗
Less handicap time		11
	1	32⅗
3. E. A Davies (3½ Premier sc.)	1	47⅖
Less handicap time		7
	1	40⅗

There was no contest in the match between the Straker-Squire car (15 h.p.) and 8 h.p. Zenith, but the stewards gave a walk-over to Geo. Griffiths (8 h.p. Zenith).

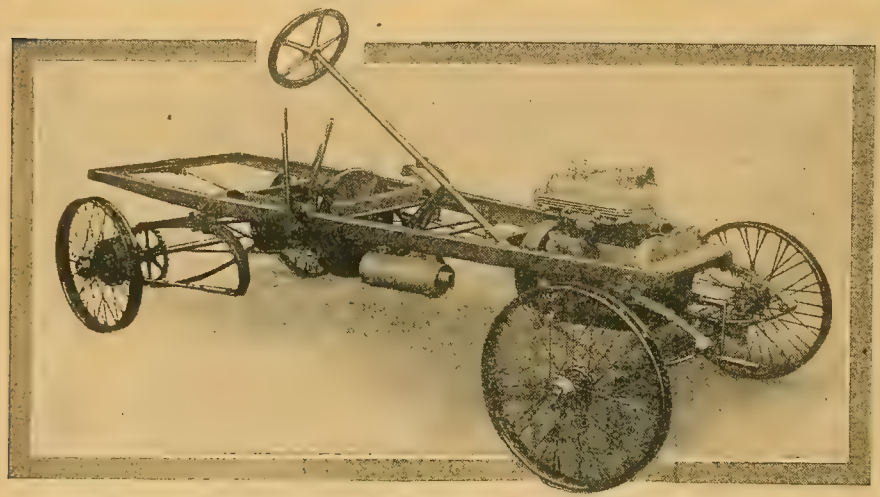
THE AJAX CYCLE CAR.

A French Production with Four Cylinders, Friction Drive, and Detachable Wheels.

A MOST interesting cycle car is being constructed in Paris for the Salon, and by the courtesy of its makers, Messrs. Briscoe Frères, we were able to examine it. The water-cooled engine is a four-cylinder, 57×96 mm., with two bearing crankshaft, the cylinders and top portion of crank case being cast together. The bottom of the case below the crank-shaft bearings is formed out of a sheet steel pressing, and acts only as a pan to retain the oil. The tops of the valves are covered by a single plate, which reduces the overall length of the engine by decreasing the spaces occupied by the threads of the valve caps. The timing gear is chain-driven, and enclosed in a sheet steel cover, so that with this and the cylinder construction cost of production is enormously reduced. The engine is suspended at three points, and the steering box lug forms one of the two rear attachments for the engine.



Plan view of the Ajax friction driven cycle car.



Chassis of the new Ajax. Note the rear springing, torque rods and detachable wire wheels.

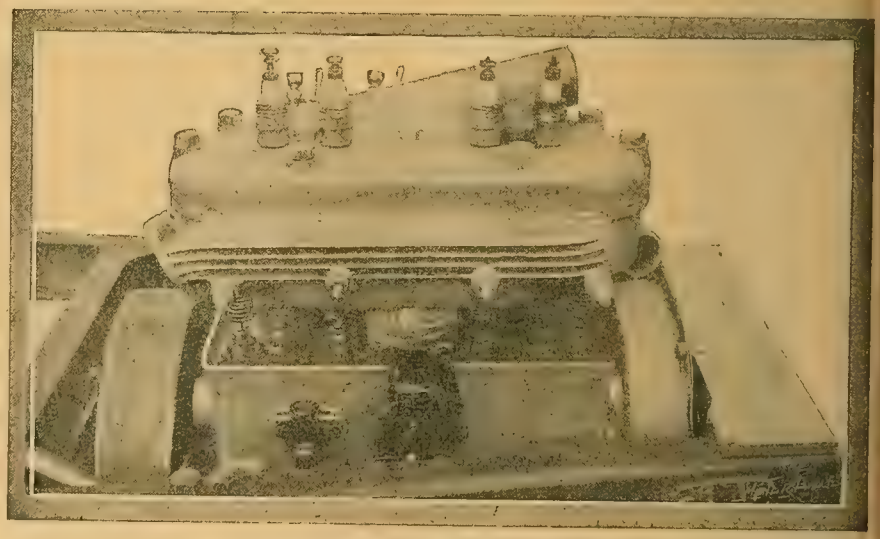
The lubrication is by plunger pump, the oil being led to a splash plate, into which the ends of the connecting rods dip. Thermo-syphon cooling is used, and the radiator is of special construction, to which we shall refer later.

The transmission is carried from the engine to a large diameter friction disc by means of a propeller-shaft, a spring disc being interposed between the fly-wheel and the shaft to allow for any slight distortion of the chassis. Next the friction disc is the friction wheel, which slides on a castellated shaft held at one side of the frame in a swinging arm bearing, and at the opposite side in a spherically held ball bearing, which allows the shaft a slight amount of movement when the tractive effort tends to draw the wheel and disc together. A dust cover is placed under the friction mechanism. This arrangement and the method of operating the wheel to slide it across the disc are reminiscent of the Turicum friction-driven car of a few years ago. We believe it to be, however, the first cycle car with a friction drive and four-cylinder engine.

From the counter-shaft the transmission to the rear live axle is by roller chain, and there is no differential.

The rear axle has double ball bearings at each end of the shaft, and the wheels are detachable. The inner hub of the detachable wheels is keyed to the axle, and over it fits an outer hub carrying the flanges for wire spokes. The inner flanges of the fixed and movable hubs are castellated, and fit together. When the wheel is slipped on, these castellations take the drive, and the wheel is fastened in position by a spring locking device in the hub cap. The brakes are all internal-cap. The brakes are all of the internal-expanding type.

The front springs are full elliptical, and the rear are of the cantilever type, and are extended down beyond the frame, where they are anchored, so that they form brackets for the radius rods, the latter being adjustable to take up the slack of the chain. It is hoped to fix the selling price at under £100.



Valve side of the Ajax cycle car engine. The timing gear cover is made of sheet steel, and the cylinders and top half of the crank case are all cast in one.

London to Edinburgh Non-engine-stop Run.

ON Tuesday of last week Rex Mundy left the A.C.U. garage, London, at 8 p.m., in an endeavour to reach the Scottish capital without having stopped his engine. The machine used was an 8 h.p. water-cooled Williamson with sidecar attached, in which was accommodated an official of the A.C.U., under whose auspices the test was being run.

No incident of any importance occurred during the whole journey, the combination running with the regularity of clockwork during the trip North.

The journey through the night was not without its disadvantages, the period between sunset and dawn at this time of the year being rather on the cold side for comfort. Newcastle was reached shortly after one o'clock on the Wednesday, and after a short stop for refreshment, during which the engine was running the whole time, the journey across the border was re-commenced.

Through the counties of Southern Scotland a keen east wind chilled the riders, and by the time they arrived at Edinburgh, shortly after eight in the evening, they were cold, tired, and hungry. We were the only pressman to witness their arrival at the Scott Memorial in Prince's Street, and few of the spectators present, when we took a flashlight photograph of the successful rider, realised that such a fine performance had been accomplished. The official observer returned South by the night train the same evening, while Mr. Mundy followed the following morning.

A flashlight photograph of Rex Mundy on the 8 h.p. Williamson and sidecar with A.C.U. representative as passenger, taken outside the National Art Gallery on his arrival at Edinburgh at 8.15 p.m. on Wednesday last week.

The following certificate of the performance has been issued by the A.C.U.:

AUTO CYCLE UNION.

Certificate of performance in a trial of an 8 h.p. Williamson motor bicycle and sidecar (under the open competition rules of the A.C.U.), September 30th and October 1st, 1913.

This is to certify that an 8 h.p. Williamson motor bicycle and sidecar was entered for a non-stop engine trial by Mr. Rex Mundy. The motor bicycle and sidecar was a standard 8 h.p. Williamson with a single-seated sidecar attached. The engine was of the water-cooled horizontally opposed twin-cylinder type, bore and stroke 85×85 mm., 964 c.c. The driver was Mr. Rex Mundy, and the sidecar was occupied by the A.C.U. official observer.

The trial was held between London and Edinburgh, the route followed being *via* Hatfield, Biggleswade, Grantham, Doncaster, Wetherby, Darlington, Newcastle-on-Tyne, Berwick-on-Tweed, Edinburgh, the total distance covered being 394 miles.

The motor bicycle and sidecar was driven throughout the trial at an average speed of 18.4 miles per hour, the total time occupied being twenty-two hours fifty minutes. During this period the road wheels were at rest for one hour nineteen minutes for food and convenience, and oil and petrol replenishments were effected. The radiator was also replenished with water on five occasions, and an adjustment of the automatic oil feed occupied thirty-eight and a half minutes. No other adjustment was effected during the trial.

The engine was not stopped throughout the total time of twenty-two hours fifty minutes occupied in completing the trial of 394 miles. The weather was fine and the roads good.

(Signed) E. PERCY GREENHILL,
Chairman of Competitions Committee.
T. W. LOUGHBOROUGH,
Secretary.

Pall Mall, London, S.W., Oct. 3rd, 1913.

THE NEW DOUGLAS LIGHT CAR.

We were able to make a brief inspection of this machine, which was competing in the Bristol M.C.C. Speed Trials at Weston-super-Mare. It is fitted with an 8 h.p. Douglas water-cooled engine, as supplied to Williamson machines, but with a separate water intake and exit to and from the radiator to each of its two cylinders. The model competing was built on car lines, with the engine set across the frame, streamline body and luxurious fittings generally, one feature of which, the lighting by a dynamo, was especially admirable. The seats are staggered.

The new 8 h.p. Douglas light car which competed in the Bristol M.C.C. Speed Trials at Weston-super-Mare. W. W. Douglas is seen at the wheel.

It is, of course, shaft driven, with side brakes, and brake acting on the counter-shaft. A mechanical oil pump, operated from the magneto drive, is an interesting feature. The machine has three gears (selective) and reverse.

SCARBOROUGH M.C.C. RELIABILITY TRIAL.

Last week, in delightful weather, the above club held their annual 125 miles reliability trial over a splendid course *viâ* Pickering, Helmsley, Ingleby-Greenhow, Castleton, Sleights, Pickering, and home. This route includes such hills as Westhouse Bank, Limber Hill, Blue Bank (over three miles long, with a particularly bad length of gradient at the top), and Hell Corner (Saltersgate). The result was as follows:

CLASS I.—For Solo Motor Cycles.

Rider and machine.	Lost marks.
1. S. H. Clay (3½ Triumph)	0
2. J. E. Truefitt (3½ Triumph)	11
3. R. Swift (3½ Bradbury)	14

CLASS II.—Passenger Motor Cycles and Cycle Cars.

1. W. E. Grange (3½ Bradbury)	7
2. C. Mosey (5-6 A.J.S.)	14
3. J. E. Brooke (5-6 A.J.S.)	40

S. H. Clay (3½ Triumph) won the Tranmer Trophy.

Middlesex M.C.C.

Owing to lack of entries the proposed eighteen hours trial will not take place.

North Birmingham A.C.

The results of the reliability trial to Rhyl and back are as follows: Gold medals—R. W. Lovegrove (7 Indian sc.), A. Butterfield (2¼ Levis), A. W. Thrush (3½ Triumph), and G. N. Norris (2½ Levis). Silver medal—E. H. Bayliss (8 Chater-Lea sc.) Bronze medal—H. Newey (2½ Levis sc.).

Liverpool A.C.C.

A non-stop speed judging contest was held recently for the Captain's Cup and Medals. The competitors were despatched at intervals round a circular course without route card, the only instructions given them being to take every right hand turn they came to until they arrived back at the starting point; two laps to be covered at twenty, and later two more laps to be covered at seventeen miles per hour. Result: 1, L. V. Barton (6 Rex), error 97 seconds; 2, Horace Marsden (3½ Triumph sc.), error 136 seconds; 3, J. Fox (6 Matchless) and Harry Marsden (3½ Zenith sc.), error 190 seconds.

Glasgow M.C.C.

On Saturday last a flexibility hill-climb was held near Lennoxtown. The gradients were in no way severe, and, the surface being admirable, the hill was very well adapted for such a contest. The total distance was divided into two portions, the first (which was the more severe gradient) being used for the slow climb, while the second part (a long gentle slope) was excellent for a speed burst.

The first man, A. R. Fraser, travelled too slowly, and stopped on the first bend. Two others also failed here, these being W. Adam (5-6 Rudge sc.) and A. D. Morrison (3½ Ariel). Perhaps the best performance was that of D. S. Baddeley (3½ P. and M.), who travelled at a walking pace to the first line, and then went off with a fine burst of speed, finishing as fast as anyone. R. M. McCulloch (6 A.J.S.) was also good, but the fastest over the speed portion was G. W. Orr (3½ Ariel). A. W. Miller (2¾ Douglas) was another whose variation was very marked, and he was a great deal better than many of the 3½ h.p. singles.

In the sidecar class, W. Carlaw (6 Enfield sc.) was undoubtedly the best, and succeeded in crawling up to the first line, and then got away very quickly, finishing at a fine speed. H. W. Ballardie (5-6 Hazlewood) was, if anything, the slowest sidecar combination over the slow section, but his acceleration might have been better.

The following are the results and prizewinners:

Sidecar Class.—1, W. Carlaw (6 Enfield sc.), figure of merit 1,050, Ariel gold medal; 2, W. Turpin (6 Campion sc.), 950, special prize given by Mr. J. S. Fulton; 3, A. McDougall (5-6 A.J.S. sc.), 955; 4, H. W. Ballardie (5-6 Hazlewood sc.), 805; 5, G. Thomson (6 A.J.S. sc.), 767; 6, A. L. Coley (6 A.J.S. sc.), 750.

Solo Machines.—1, D. S. Baddeley (3½ P. and M.), figure of merit 620, gold medal; 2, R. M. McCulloch (6 A.J.S.), 550; 3, G. W. Orr (3½ Ariel), 538; 4, A. W. Miller (2¾ Douglas), 496; 5, R. G. McGibbon (3½ Norton), 491; 6, W. Hood (3½ Rudge), 472; 7, R. D. Fleming (3½ Triumph), 463; 8, W. B. Cramb (3½ Elswick), 420.

Herts M.C.C.

The fourth and last open half-day trial of the year will take place on Saturday, October 18th, starting from Barnet at 10 a.m. The regulations and entry forms for this trial and also for the open flexibility trial in Brookman's Park may be had from the sports honorary secretary, Mr. C. C. Cooke, North Mymms, Hatfield.

Barton-on-Humber and District M.C.C.

The results of the hill-climb held on the 27th ult. were as follows:

Class I.—For Motor Cycles up to 350 c.c., on formula.

		Figure of merit.
1.	F. G. Howard, Scunthorpe (F.N.) ...	278.8
2.	E. Hounslow, Brigg (N.S.U.)	343.25

Class II.—For Motor Cycles up to 570 c.c., on formula.

1.	W. Rhodes, Moortown (Rover)	321.1
2.	M. Wadsworth, Goole (Norton)	333.33

Class III.—For Passenger Motor Cycles, any capacity, on formula.

1.	F. G. Howard, Scunthorpe (Quadrant) ...	337.4
2.	W. E. Slack, Barton (Elswick)	415.0

Class IV.—For T.T. Motor Cycles, on time.

2.	F. Hopper, jun., Barton (Torpedo) ...	20s.

GLASGOW M.C.C. FLEXIBILITY HILL-CLIMB AT LENNOXTOWN LAST SATURDAY.

R. G. McGibbon (3½ h.p. Norton) crossing the finishing line. A. D. McDougall (6 h.p. A.J.S. sidecar) accelerating in the fast portion.

Club News.—

Cheltenham M.C.C.

The third reliability trial for the Williams Challenge Bowl was run off on the 27th ult. The route selected was a very severe one, including Withington, Birdlip, and Portway Hills. The awards were: F. Y. Ruck (2½ A.J.S.), full marks, silver award and prize presented by Mr. F. W. Corbett for the best performance by an amateur; W. B. Gibb (2¾ Douglas) and T. R. Trotter (3½ B.S.A.), full marks. Tetley (2¾ Sunbeam) and Farmer (4 Precision) also completed the course, non-stop.

Dumfries and District M.C.C.

A petrol consumption trial took place on the 27th ult., over a stiff course from Maxwelltown Station, and the result was as follows: 1, W. Bell (6 Matchless sc.), 29 miles; 2, J. Smith (3½ B.S.A.), 28½ miles. The formula used was $\frac{C \times W}{15}$

A hill-climb was held immediately after at South Carthat Hill, Collin, with the following results:

On Time.

	Rider and machine.	Time.
1.	T. K. Newbigging (6 Rex)	40s.
2.	A. Midgley (3½ Triumph)	42s.
3.	J. Smith (3½ B.S.A.)	49s.

On Formula.

		Figure of merit.
1.	A. Midgley (3½ Triumph)	423
2.	J. Smith (3½ B.S.A.)	419
3.	T. K. Newbigging (6 Rex)	278

Port Elizabeth M.C.C.

This club held its speed trials on September 6th, when a large number of South African motor cyclists showed the paces of their mounts. All the competing machines but one were of British make.

In the sidecar class, G. Matthews, riding a 3½ h.p. Rudge, won easily, and he also annexed the 500 c.c. solo class, covering the threequarter-mile course in 43s. with a flying start, the highest speed of the day. The leaders were:

Class I.—Lightweights up to 400 c.c.

1.	R. Inggs (2¾ Humber)	52⅖s.
2.	W. R. Dennis (2¾ Douglas)	56⅕s.
3.	R. K. How (2¾ Douglas)	68⅘s.

Class II.—500 c.c.

1.	G. E. Matthews (3½ Rudge)	43s.
2.	H. G. Braybrooke (3½ Alldays)	50s.
3.	W. Wilson (3½ New Hudson)	52⅘s.

Class III.—Sidecar Class.

1.	G. E. Matthews (3½ Rudge)	58⅖s.
2.	P. G. Parnell (5-6 Rudge)	61⅖s.
3.	E. J. Green (3½ New Hudson)	68⅖s.

Purley M.C.C.

The night trial on the 27th ult. resulted as under: 1, C. W. Meredith (Bradbury sc.), Scott Cup and silver medal; 2, H. B. Willoughby (Rudge-multi); 3, R. G. Charlesworth (6 Zenith sc.); 4, D. Iron (B.S.A.). The course was to Eastbourne, over Beachy Head, through Seaford, Newhaven, and Lewes home—113 miles—and the schedule speed 20 m.p.h.

Kidderminster M.C.C.

A hill-climb was held on the 20th ult. A standing start was made at the foot of the hill, which was about 300 yards long, average gradient about 1 in 7. Results:

Class I.—Lightweights, up to 350 c.c.

		Time.
1.	J. W. Timmis (Douglas)	24⅗s.
2.	C. A. Nicholls (Douglas)	26⅘s.
3.	G. Dance (A.J.S.)	27⅗s.

Class II.—Standard touring, up to 500 c.c.

1.	B. L. Bird (Rudge-Multi)	22⅘s.
2.	C. H. Williams (Triumph)	27⅖s.
3.	H. Mantle (Ariel)	30⅗s.

Class III.—Tourist Trophy, up to 500 c.c.

1.	F. W. Giles (Triumph)	20s.
2.	J. G. Nickson (Rudge-Multi)	22⅕s.
3.	C. Rhodes (Premier)	22⅗s.

Class IV.

1.	H. J. L. Greatwich (5 Wright-Blumfield)	19s.
2.	F. Giles (3½ Triumph)	19⅘s.
3.	C. Humphries (5 Bat-Jap)	20s.

Malvern and District M.C.C.

The hill-climb held at the British Camp resulted as under. There was a very good entry, excepting the 350 class and touring 500 class. There was a large crowd in attendance.

Class I.—Up to 350 c.c.

		On time.
1.	Guy Smith (2¾ Sunbeam)	31⅕s.

Class II.—Up to 500 c.c.

1.	J. G. Nickson (3½ Rudge)	22⅕s.
2.	B. E. Surman (3½ Alldays)	23s.
	F. Giles (3½ Triumph)	23s.
4.	S. Jones (3½ Ixion)	28s.

Class III.—Up to 1,000 c.c.

1.	H. J. G. Greatwich (5 Wright-Blumfield)	19⅕s.
2.	R. E. Surman (5 Matchless)	21s.
3.	J. G. Nickson (3½ Rudge)	22⅕s.

Class IV.—Sidecars and Cycle Cars, on *The Motor Cycle* formula.

1. —: Hall (6 Enfield sc.).
2. S. W. Aitken (8 Zenith sc.).
3. W. Crocker (5 A.J.S. sc.).

Class V.—Up to 500 c.c., on formula.

1. R. E. Surman (3½ Alldays).
2. G. Smith (2¾ Sunbeam).
3. B. Bladder (3½ Rudge Multi)

THE NORTH WALES TRIAL OF THE LIVERPOOL A.C.C.

(1) A. J. Dixon (3½ h.p. Singer) in Henllan. (2) J. H. Sedgwick (3½ h.p. Rudge, in the act of skidding in the grease on Llanfair. (3) E. F. Baxter (Rex) ascending Altybady, a freak hill outside Llangollen.

Wulfrunas in London.

Messrs. Selfridge, Limited, Oxford Street, W., have taken up the sole agency for the South-West of London for Wulfruna motor cycles.

An Engineer-designer.

Harry A. Smith, designer of the Dayeds and Ilston and Smith motors, is now a consulting engineer with premises at 58, Durlston Road, Kingston-on-Thames. Mr. Smith's long experience in the various branches of the motoring industry in designing, drawing, and pattern making should stand him in good stead.

Mechanical Drawings Wanted.

The Superintendent of the Mechanical Engineering School, Bangalore, Mysore, India, would be glad to receive blue prints or diagrams suitable for hanging on walls for the purpose of lecturing and demonstrating in the schools. Drawings relating to internal combustion engineering, turbines, pumping machinery, etc., will be welcomed.

Drummond Lathes.

At the Small Power Engineering Exhibition to be held at the Horticultural Hall, Westminster, in October, Messrs. Drummond Brothers, Limited, the well-known lathe manufacturers, inform us that they will be showing on Stand 17 their 3½in., 4in., 5in., and 6in. lathes, drills, etc. One of the exhibits will consist of a 3½ h.p. motor cycle engine made on a 3½in. centre lathe.

A Rim Protector.

We recently inspected a device for protecting the rims of motor cycles from being damaged or badly worn by brakes. Strips of a metal which is for the most part composed of nickel steel, are electrically welded to that part of the rims to which the brakes are applied. The advantages of these strips are that they lend the machine a neat appearance, wear white right through, and do not rust. The makers are F. Attwood and Co., 99-107, Rosebery Avenue, London, E.C.

An Unstretchable Belt.

The Midland Rubber Co.'s new belt should appeal to motor cyclists who have been sufferers from belt troubles. Piano wire of great strength is incorporated in the rubber, and moulded in the usual V shape five ply wire in ⅞in., six ply in 1in., and seven ply in 1⅛in. This combination, whilst giving great strength, is claimed to prevent undue enlongation; and any good fastener may be used.

British Successes in Toronto.

We have received details of a reliability run held on September 14th near Toronto, round Lake Simcue, which proved to be one of the most strenuous one-day runs ever held in the Dominion. The distance was 181 miles, and so bad was the sandy going in places that the riders were glad to take to a railway line and bump along the sleepers. There were twelve Triumphs in the run, and all but one got through with flying colours. The Triumph machine has frequently distinguished itself in Canada, and there are in the neighbourhood of Toronto motor cycling clubs composed exclusively of Triumph riders.

SPARKLETS

Tyre Successes at Brighton.

E. B. Ware, who was a most successful comepetitor in the recent Streatham and District M.C.C. races at Brighton, where he won three events, was using Clincher tyres on his Zenith.

A Durable Belt.

We have heard of a wonderful record of a Centipede belt, which is made by W. Pollin, Shepherdswell, near Dover. The belt in question, according to its owner, who is a medical man, has been in constant use since September, 1910, and has been employed a good deal for sidecar work. The owner says that it seems good for many hundreds of miles yet.

Catalogues Received.

We are in receipt of a catalogue of hardening furnaces, etc., sent to us by S. N. Brayshaw, 2-4, Mulberry Street, Hulme, Manchester. To motor cyclists the most interesting part of the catalogue is that devoted to useful mathematical tables, giving hints on converting degrees in temperature centigrade into Fahrenheit, and *vice versa*, and millimetre and decimal equivalents.

European Maps.

Messrs. Freytag and Berndt, Vienna, have published another sheet of their excellent maps of Europe. This is Section 31, comprising the North of Holland. The maps are clear, and should be invaluable to tourists on the Continent. The sections comprise parts of Holland, Denmark, the whole of the German Empire, part of Austria-Hungary, Bosnia, Montenegro, the north of Italy, the whole of Switzerland, and parts of France.

A New Address.

Messrs. Bi-Metals, Ltd., the makers of the well-known Tinol outfit, inform us that they have moved into more commodious premises at 57, Lant Street, Southwark, S.E.

Grease Injectors.

Messrs. A. R. Price, Vevo Works, Park Lane, Aston, Birmingham, make a speciality of grease injectors for motor cycles and cycle cars. These are extremely useful accessories, which are made in no less than four different sizes.

A Demonstration Van.

Messrs. The Acetylene Publicity Ltd., 285, Winchester House, Old Broad Street, E.C., are about to send an elaborately equipped van round the country demonstrating the different devices for lighting and cooking by means of acetylene gas, and oxy-acteylene welding. Naturally, the lighting and welding processes should be of interest to users of motor cycles.

A Sidecar Treatise.

The Enfield Cycle Co., Ltd., Redditch, forward a very well got up booklet entitled "The Book of the 6 h.p. Enfield Sidecar Combination." This describes and illustrates very thoroughly all the various parts of this well-known combination, and should be invaluable to all users, especially when ordering spares.

Fitting New Pistons.

The Gradior Machine Co., Stafford, who have an excellent reputation for cylinder grinding, are prepared to fit new pistons and rings and regrind cylinders of all 84 and 85 mm. bore engines for the sum of 30s. This is a big reduction on their previous price, which was in the neighbourhood of £2. The above only applies to cylinders of the dimensions given, special arrangements having been made to deal with this size of engine. The same firm construct a single-cylinder 86 × 90 mm. standard type engine suitable for sidecars, rated at 3¾ h.p. As there are a number on the look out for a big single suitable for sidecar work it will probably be welcomed by readers.

BRITISH MOTOR CYCLES OVERSEAS.

A group of motor cyclists of East London, South Africa, who are all riders of 3½ h.p. Triumph machines. H. Becke, the sender of the photograph, says, "my own machine is a 1911 model, and I have covered 12,000 miles without any replacements to the engine."

ANOTHER **HORLICK** OFFER.

A LEATHER CASE WITH FLASK OF HORLICK'S LUNCH TABLETS.

To be attached to the Frame.

BY POST COMPLETE FOR 2/6

Also a New and Accurate Road Map of ENGLAND & WALES in Leatherette Case, with Roads shown in Colours and Classified, will be sent FREE with this Case and Flask.

THE LEATHER CASE illustrated is strongly made in solid, light brown leather, and is excellently finished. It may be attached to the handle-bars or frame in a convenient position, so that the Flask may be removed for use at a moment's notice without dismounting.

Horlick's Lunch Tablets contain all the valuable nutriment of full cream milk and choice malted grain in a convenient tablet form. A few dissolved in the mouth from time to time will supply the necessary nutriment to maintain strength and vigour, and restore energy when Touring or Racing, and are useful at all times.

PRICES: IN GLASS FLASKS TO FIT CYCLE CASES—ONE SHILLING EACH,
and in Sterilized Glass Bottles, from which these may be refilled, 1/6, 2/6, and 11/-, at all Chemists and Stores.

MATCHLESS MOTOR CYCLES ARE MATCHLESS

Triple success for SUMMER

HUILE DE LUXE

1 S. Huile de Luxe was used by Mr. P. W. MOFFATT on his 2¾ h.p. Douglas, when he obtained the highest figure of merit, irrespective of class in the A.C.U. Six Days' Trial.

2 The same lubricant was used by Mr. R. G. MUNDY on his 3½ h.p. Triumph, the winner of the highest figure of merit in the 500 c.c. class, and by Mr. REX PEARSON (5-6 h.p. Clyno), who obtained the highest figure of merit in the 750 c.c. (passenger) class.

3 S. Huile de Luxe was also used by Mr. MORGAN on his 8 h.p. Morgan —the only air-cooled engined Cycle Car to gain a Gold Medal.

Proofs of efficiency which will appeal to every practical motor cyclist. Write for Lists to

(as illustrated)

AFTER careful tests we are convinced that the "Wolf" Motor Cycle is the best value on the market. Our expert has given the machine a severe trial, and has found it completely satisfactory.

It runs 160 miles to the gallon of petrol, at a speed of 35 miles per hour, the engine is built into the frame, not insecurely fastened as on the usual low-priced machine.

The great demand for a low-priced, lightweight motor cycle has enabled the Wulfruna Engineering Co., Ltd., to manufacture a greater number of machines at a substantial reduction on the cost of production, thus bringing a reliable machine within the reach of every prospective motor cyclist. We recommend this lightweight for the use of professional and business men as well as the "week-ender."

The compact, light and simple construction of the "Wolf" allows for easy adjustment; every part is in sight and can easily be "got at."

We are the Sole West End Agents for the "Wolf" Lightweight.

You can obtain immediate possession of the "Wolf" on payment of £5 deposit, and twelve monthly instalments of £1 13 8.

Specification of the Wolf 2½ h.p. Motor Cycle

Engine: By Ilston, of Birmingham. Single-cylinder, 76mm × 65mm. (cc. 298), giving over 2½h.p. at 4,000 revolutions per minute. Valves are of large area and easily detachable. Cylinders cast in special mixture of iron to withstand rough usage. Flywheels of extra large dimension, mounted on ball bearings. Adjustable pulley of simple construction. Gear ratio is 5-1 to 8-1.

Crank Case: Made of aluminium, of extra strong construction. Valve motion enclosed, oil and dust tight.

Carburetter: Amac or Senspray of latest type.

Ignition: High tension U.H. magneto, latest enclosed type, protected from mud and dust.

Transmission: ¾in. best quality rubber belt, with patent adjustable pulley.

Forks: Pilot spring forks, of latest type.

Tank: Sheet steel. Petrol capacity 1 gallon. Oil capacity 1 pint. Large filler caps and pump can be easily manipulated from saddle.

Wheels: 26in. × 2in., extra strong spokes and nipples, well tensioned and accurate.

Tyres: Hutchinson, 26in. × 2in.

Brakes: Foot rim, with Bowden handle-bar lever. Back belt rim actuated by foot pedal.

Foot Rests: Adjustable, with rubber covers fitted.

Mudguards: Wide, with side splashers to front guard.

Frame: Neat, light, and strong, made of best weldless tubing, and reinforced in all vital parts. Gives low riding and well-balanced position to rider.

Controls: Front brake, air and throttle and valve lifter all controlled from handle-bar by means of latest Bowden attachments. Magneto controlled by lever fitted to tank.

Finish: Enamelled black and lined throughout. Tank enamelled green and gold. Complete with number plates, tool bag, oilers, spanners, pump, and clips.

If unable to call write for full particulars.

Manningham Lane,

BRADFORD

£10-10-0

Ten guineas is all it costs to bring your mount up-to-date by the addition of the

1913½ ROC REVERZ

SIDECAR PATTERN

Two-speed Gear.

(6 Days' World's Sidecar Record type)

The 1913½ big clutch type has been designed expressly for passenger work.

It solves all gear worries and guarantees you satisfaction.

The 1913 Roc gear was already recognised the last word in motor cycle gears for solo use.

The 1913½ big clutch type is just what thousands of "sidecarists" have awaited and expected.

The Roc gear was the first of all motor cycle gears—it is the first to-day. Nothing could be smoother, easier to operate, or be more reliable.

No better investment for the money is possible than in this 1913½ Roc dependable gear, fitted complete for ten guineas.

Write for particulars, stating make and h.p. of your machine.

No delay in delivery.

SIDECAR COMBINATIONS.

1908 Triumph and Sidecar, Bosch, overalls; £18.—21, Goda St., Lambeth. [X2258

4-CYL. 1913 F.N. and Sidecar, as new.—Heath, Salford Priors, Warwickshire. [X2339

ZENITH 6h.p. Twin, 1912, Montgomery sidecar; £50. —809, Attercliffe Rd., Sheffield. [X2263

1913 3½h.p. Rover and Coachbuilt Sidecar, nearly new; £55.—Thos. Booth, Frodsham. [X2413

V.S., 5-6h.p., twin, 2-speed, Millford castor sidecar; £26.—62, Irving Rd., Bournemouth. [2611

TRIUMPH, 1909, with sidecar, lamp, horn, Cowey, accessories; £30.—32, Market St., Wigan. [X2308

4h.p. N.S.U. and Millford Sidecar, 2 speeds, complete, all spares; £25.—Cross, Jeweller, Rotherham. [X2421

3½h.p. Motor and Sidecar; nearest offer to £15.—Andrewe, Silverdale, King Edward St., Slough. [2579

1912 Humber, 3½h.p., Canoelet sidecar, run 2,000 miles; 50 gns.—Edwards, Wesham, Kirkham. [X2338

BRADBURY and Sidecar, 1911-12, N.S.U. 2-speed; £29/10.—Mason, Schoolmaster, Bentley, Doncaster. [X2494

ZENITH, 6h.p., 1913, and Millford sidecar, in good condition; £60.—C. Anfrey, R.M.A., Woolwich. [2530

TRIUMPH, 1911, free engine, canoe sidecar; 50 mile trial; £35.—74, Knapp Rd., Bow, London, E. [2629

1913 Clyno, 5-6h.p., complete with sidecar, 3 speeds, F.E., etc.; £78.—Cordingley, Haslingden. Tel.: 2Y. [2143

1913 Singer 4½h.p. Sidecar Combination, brand new; list £80, accept £65.—Cordingley, Haslingden. Tel.: 2Y. [2145

1913 James, 3½h.p., 3-speed, chain drive, complete with Canoelet sidecar, brand new; list £76/13, clear for £66.—Cordingley, Haslingden. Tel.: 2Y. [2142

ENFIELDS.—Keenest cash prices, E.P. no extra, ¼ down and the balance by 12 payments.—Lamb's (below).

SINGER, 3½h.p., with sidecar and accessories, splendid order; £35, bargain.—Lamb's (below).

ENFIELD, 1912½, 6h.p., 2-speed, combination, complete 2 lamps, horn, speedometer; £65; no reasonable offer refused, either cash or easy payments. —Lamb's, 151, High St., Walthamstow. 2428

3½h.p. Humber and Sidecar, complete lamp, horn, spares; £35.—Box 4,245, *The Motor Cycle* Offices, Coventry. [X2423

TRIUMPH, 1913½, F.E., with accessories, and Viceroy torpedo sidecar; £57/10.—3, Sandringham Parade, Ealing. [2450

1912 T.M.C. and Sidecar, water-cooled, 3 speeds, spare tyre, etc.; owner gone abroad; best offer.—Marley, Workington. [X2406

5-6h.p. A.J.S., Millford coachbuilt sidecar, nearly new; £49/10; appointment.—P. C. Bridge, 18, Pinfold Rd., Streatham. [2567

REX Sidette, latest 1913, 6h.p., coachbuilt sidecar, splendid order; must sell, what offers?—159, Leam Terrace, Leamington. [X2334

6h.p. Rex, handle starting, B.B., Whittle, new handsome sidecar; £24/10, or separate.—30, Alexandra Rd., Canton, Cardiff. [X2501

RUDGE, 1912, and 10 gn. coachbuilt sidecar, both in new condition; nearest £40.—F. Jackson, 25, Industrial St., Todmorden. [2466

TRIUMPH, 1911, Villiers F.E. clutch, 1913, and sidecar, all accessories, including policy till May; £42. —2, Crosby Rd., Birkdale. [X2467

REX de Luxe, 6h.p., free engine, 2 speeds, mag., with torpedo sidecar; sell turnout £28.—103, Heeley Rd., Selly Oak, Birmingham. [X2483

JAMES and Canoelet Sidecar, new April, splendid condition; £60.—Apply, after 7 p.m., Roberts, 3, Blessington Rd., Blackheath. [2594

REX, 1912-1, 2-speed, and sidecar, complete with all spares, 6h.p., only wants seeing; at £47.—Pond, 349, West End Lane, London. [X2508

TRIUMPH, 1912¾, clutch model, canoe sidecar, horn, lamp, spares; £45; perfect condition.—19, Mayflower Rd., Clapham, London. [2577

1912 6h.p. Rex de Luxe, free engine, 2 speeds, with £16 sidecar, all in new condition; bargain £36 —32, Clarendon St., Coventry. [X2431

ARIEL, 1913½, 3-speed, kick start, with coachbuilt sidecar, perfect combination; £55, or near offer.—Johnson, Bath St., Leamington. [X2180

3½h.p. Brown, 1913, free, 2-speed, kick starter, sidecar, all accessories; bargain, £45.—Knight, 202, Whitehorse Lane, South Norwood. [X2392

4¼h.p. Precision, Bowden 2-speed, 650×65 tyres, pan saddle, Chater-Lea sidecar; £40; trial given.—224, Wood St., Walthamstow. [2485

STRONGER SCREWS

are fitted to all our 1914 Fasteners.

SIDECAR COMBINATIONS.

KERRY-ABINGDON, 1911, 2 speeds, 1912 sidecar, excellent condition; £32; weekdays only. —290, Milkwood Rd., Herne Hill. [2423

6h.p. Enfield Sidecar Combination, 1912 model, coachbuilt sidecar, complete; £57/10 cash.—Box 4,170, *The Motor Cycle* Offices, Coventry. [X956

CLYNO, late 1912, coachbuilt sidecar, Jones speedometer, F.R.S. lamps; any trial; cost £95, £60.—4, Harrowgate Rd., South Hackney. [2652

1909 Triumph Motor Cycle and Phœnix Sidecar, N.S.U. 2-speed gear, F.R.S. lamp and generator, in very good condition; offers.—Below.

1912 P. and M. Motor Cycle and Forward Sidecar, fitted with speedometer, wind screen, luggage carrier with box, F.R.S. lamp and tools; £55.—Glendower Motor Co., 3, Glendower Place, South Kensington. Kensington 558 and 559. [2215

4h.p. 1912 Singer, with sidecar, speedometer, horn, lamp, new belt, perfect; £45.—Box L2,843, *The Motor Cycle* Offices, 20, Tudor St., E.C. [2533

MATCHLESS 6h.p. Twin, 1911, 2 speeds, nearly new, coachbuilt sidecar, condition, including tyres, as new; £48.—736, Holloway Rd., London. [X1738

CLYNO, 1913, brand new, 3-speed model, 3in. back tyre, interchangeable wheels, latest engine; £62, cost £75.—Potter, Leicester Grove, Leeds. [X2400

BRADBURY, 1913, 3 speeds, kick starter, lamp, horn, spares, and coach sidecar, excellent order.—P. J. Evans, John Bright St., Birmingham. [X2446

ENFIELD, 1913, 6h.p., 2 speeds, coach sidecar, Lucas horn, mirror; cost £86, accept £65.—P. J. Evans, John Bright St., Birmingham. [X2448

ZENITH, 1911, 3½h.p., Gradua gear, and wicker sidecar; £30.—P. J. Evans, John Bright St., Birmingham. [X2449

1912 6h.p. Clyno Coach Combination, chain drive, 2 speeds, kick start, accessories, fine condition £43.—Jordan, Bookseller, Walton-on-Thames. [X2488

1912 6h.p. Rex and Sidecar, new June, 1913, complete Cowey, lamp, horn, spares, etc.; £45.—Box 4,244, *The Motor Cycle* Offices, Coventry. [X2422

3½h.p. Triumph, 1910, free engine, new cylinder, etc. speedometer, all accessories and sidecar; £35; without sidecar £32.—22, Belsize Sq., N.W. [263

BRADBURY, 1913, 3½h.p., 2-speed, chain drive, kick start, coachbuilt sidecar; cost £72 May, splendid condition, £52.—88, Tannsfield Rd., Sydenham. [244

KERRY-ABINGDON, 5h.p., Millford sidecar, Brown Barlow carburetter, accumulator, trembler; bargain, £15.—306, New Cross Rd., London, S.E. [246

1912 Clyno, with Clyno coach sidecar; genuine bargain; tyres perfect, Kempshall back; £60, or nearest offer.—Lovelace, Hentsridge, Somerset. [X227

1912 Matchless, 2 speeds, free engine, double belt drive, and 16 gn. sidecar; trial given; £60.—Wilson, 119, Nelson St., South Bank, S.O. [255

4½h.p. Twin Minerva and Sidecar, Mabon, Bosch, B and B., new belt, tyres perfect, splendid condition; £22, bargain.—120, Anerley Rd., Anerley. [252

5-6h.p. Twin Peugeot, Druids, Mabon clutch, Bosch Whittle, excellent condition, nearly new wicker sidecar; £40.—Henshaw, wheelwright, Stockport. [X243

CHATER-LEA-J.A.P., 3½h.p., N.S.U. 2-speed, enclosed sidecar, child's seat, side entrance £30.—Glenholme, Osmond Gardens, Wallington. [264

TRIUMPH, free engine, 1912¼, 2-seat. sidecar, 2¼in Pedley tyre on back, splendid condition; £42/10.—Berridge, 1, Nithsdale Av., Market Harborough. [X237

1912 Rover, 3½h.p., 3-speed, not ridden 800 miles perfect condition, cane sidecar, with accessories lowest £38.—Bristow, 128, Queen's Rd., Hastings. [X230

REX, 6h.p., new sidecar, magneto, clutch, fine order quick sale, going abroad; £25 or nearest.—Advertiser, 5, Belsize Grove, Hampstead, London. [261

SCOTT, late 1911, with 1913 coach torpedo sidecar plating and general condition splendid; £39; see any time.—Nicholls, 29, Chapel St., Belgravia, London [X239

REX de Luxe, late 1912, 6h.p., m.o.v., Bosch watertight mag., free engine, 2 speeds, fitted with handsome sidecar; sell turnout £39.—12, Bull Ring, Birmingham. [X247

8h.p. 1911¾ Bat and Millford Castor Wheel Sidecar new tyres, new belt, P. and H. lamp set, 2-speed and free; sacrifice, £45.—20, Milkwood Rd., Herne Hill. [X246

CHATER-LEA, No. 7, 6h.p., 2-speed, and Glorspring wheel coachbuilt sidecar, large P. and lamp, watch, 23/- horn, all accessories, excellent condition; any trial; sacrifice, £45.—20, Milkwood Rd., Herne Hill. [X246

1910 Bradbury, sidecar, 1913 N.S.U. gear, 2 new tyres and tubes, lamp and horn, condition sound £30, no offers.—6, Fosbury Mews, Inverness Terr., Bayswater. [249

HUMBER, 1911¼ 3½h.p., 2-speed, F.E., with Montgomery cane sidecar, in fine condition, spare overall suit; £33.—Smith, Wesley Rd., Hemel Hempstead. [25

HUMBER, 1911, 3½h.p., 2-speed, B. and B., Bosch Millford torpedo body sidecar, nearly new tyres F.R.S. lamp, watch, etc.; 30 gns.—668, High Rd., Leyton. [26

Cycle Cars.

THE Royal Automobile Club's and the A.C.U.'s well-meant attempt to provide for the type of vehicle which appeared to be coming definitely on to the market a year or so ago, by giving it a class name, formulating an official definition of it, and delegating its control on the sporting side to the Competitions Committee of the Auto Cycle Union, has resulted in a condition of affairs which would be amusing, indeed ludicrous, but for the serious effect it is having upon the motor cycle industry and also upon the public.

We suppose the Royal Automobile Club and the A.C.U. Special Joint Committee when they coined the term "cycle car" had in mind the belt-driven, air-cooled, four-wheeled vehicle of which many examples appeared at that time. Presumably, they did not anticipate the development of the *small light car*, which is merely a reduced *facsimile* of a full-sized motor car and obviously a different proposition altogether, and in no way connected with the cycle car, so they proceeded in an airy fashion to lay down a rule that any motor vehicle with an engine capacity not exceeding 1,100 c.c. and a total chassis weight of 6 cwt. should be labelled a "cycle car," and as a consequence should pass under the jurisdiction of the A.C.U. in matters pertaining to competitions and so forth. Since this step was taken, however, considerable attention has been devoted to the problem of providing a lightweight two-seater, and as we predicted and have held all along, the development has been for all practical purposes in the direction of the light car built in every essential particular on accepted car lines, in the majority of cases with a four-cylinder water-cooled engine, three-speed gear box, shaft drive, and differential. The subject has from the first received our closest attention, and from observations of developments for 1914, we are satisfied that the tendency is still more pronounced in favour of the light car pure and simple.

Now it is obvious that this unsatisfactory state of affairs from the motorist's point of view cannot go on. Already the true cycle car has been handicapped in its struggle for a place in the motorist's favour simply by being overshadowed by the larger and more expensive type of vehicle, which cannot by any stretch of imagination be termed a cycle car. Nor can the A.C.U. be altogether excused for such a state of affairs. Instead of seeing that its definition has been carried out to the letter, it has been content to sit on the wall and ignore the fact that cars exceeding half a ton weight are competing in so-called cycle car events. So long as the engine capacity was restricted to 1,100 c.c., the A.C.U. appears to have been satisfied. It therefore rests with *The Motor Cycle* to take the first step to bring about a better state of affairs. It must be confessed that the belt and belt-cum-chain-driven vehicle on motor cycle lines has made little or no progress in actual use on the road, though, unfortunately, owing to the injudicious booming it has received in certain quarters, many small manufacturers have been tempted to spend time and capital upon its production, with little prospect of remunerative return. It should here be remarked that we are referring to the new types of cycle cars, and not to those such as the A.C. and Morgan, which long ago won their spurs and whose reliability was unquestioned before the cycle car definition was thought of. Not only has the premature boom in question done much harm in this connection, but for the time being it has seriously damaged the motor cycle movement in that it has unsettled the minds of the public by leading people to believe that in the cycle car they might expect to find a more satisfactory vehicle than the very efficient, economical, and comfortable sidecar outfit, which has reached the stage of having proved itself to be by far the best passenger machine on the road at an outlay of about £100. Fortunately, the merits of the sidecar combination have been so clearly evident that, although the demand has been adversely affected as a result of the boom referred to, we have no doubt whatever that 1914 will see it more firmly established than ever in the affections of the public, as those who have been hesitating to purchase a sidecar combination will hesitate no longer.

The True Cycle Car Overshadowed.

MUCH of the criticism which has been levelled against the belt and chain driven types of cycle cars and the poor name they have at present, is largely due to the unfair comparison to which they have been subjected by competing with vehicles almost twice as heavy and doubly expensive. We hold that their development is not assisted, but is retarded, by the present unsatisfactory position created by the action of the R.A.C. and A.C.U. joint committees, which is referred to above. For instance, in competitions to-

day, the true cycle car must enter in a class which also admits the small car, and naturally it does not show up to advantage in such circumstances. The governing bodies have as yet made little or no attempt to rectify this unfortunate state of affairs by seeing that their definition is adhered to.

The other side of the question is almost as absurd. Light cars, many of which, as we say, exceed half a ton weight, are compelled to label themselves with the (for them) misleading title "cycle car," and enter competitions under the *ægis* of the Auto Cycle Union, otherwise they are debarred from all but a few competitions.

We have, for example, a One Day Trial arranged for the 29th October ostensibly for cycle cars, but, excluding the already proved types, it is safe to predict that the majority of the entries will be light cars. Again, the Auto Cycle Union proposes to run a "cycle car" race in the Isle of Man in September of next year, and again it is safe to assert that unless the A.C.U. sees the definition is adhered to the entrants who will distinguish themselves on that occasion will be the drivers of the light car type. Apart from the absurdity of such a position, the harm done is twofold: on the one hand the successes achieved are advertised as "cycle car" successes, and the indiscriminate public is apt to conclude that cycle cars as a class have successfully demonstrated their capabilities, which, of course, is not really the case. On the other hand, such true cycle cars as are entered stand very little chance of putting up a good show against their heavier and more expensive rivals, and so they are robbed of the encouragement which would rightly be theirs if the race were confined to cycle cars only.

The position of affairs on the Continent is equally absurd, if not worse, than it is here. In France cycle car classes are already subdivided into cycle cars with engines not exceeding 750 c.c. and 330 lbs. minimum weight and cycle cars with engines not exceeding 1,100 c.c. and 385 lbs. minimum weight. The same rule regarding chassis maximum weight as defined by the R.A.C. and A.C.U. also holds good. The result is that stripped and lightened voiturettes are made eligible for the 1,100 c.c. class, but the same chassis when sold to the public often weigh 8 cwt. or more.

Space will not permit us to pursue this phase of the subject further, nor is there perhaps any need to do so, since intelligent motorists recognise the illogical position at which the movement has now arrived. Whatever the view of the Royal Automobile Club, the Auto Cycle Union, the Motor Cycle Manufacturers' Union, and the Society of Motor Manufacturers may be, we feel that, in the interests of our readers, it is incumbent upon us to do what lies in our power to straighten things out; in fact, to relegate light cars to the car class, to which they unquestionably belong, and to deal with true cycle cars only as a development of the motor cycle. Therefore, in so far as cycle cars deserve encouragement and assistance, they will receive such very fully in the pages of *The Motor Cycle*. On the other hand, light cars will be dealt with adequately week by week in the pages of our sister journal *The Autocar*. So, in future, readers of *The Motor Cycle* will find its pages exclusively devoted to the encouragement of the motor bicycle, sidecar, and true cycle car—in other words *every phase of the motor cycle movement*—but the light car, which because of the official definition (which we have hitherto felt bound to respect) has crept into our pages, will be exclusively dealt with in *The Autocar*. We hope by such action that we are giving a lead to the governing bodies which they will see the wisdom of following, but whether they do so or not, we intend to do all we can to put an end to the present illogical position, and give the true cycle car the encouragement it needs.

Vehicles which it may be argued are just on the borderline of either class will be dealt with on their merits, probably in both papers for the time being, since we do not propose to be limited by rigid rules, but rather by commonsense in this matter.

We have every confidence that our readers will appreciate our action, and we hope they will use their influence in the same direction.

MIDLAND OPEN RELIABILITY TRIAL.

(1) R. W. Lovegrove (Ivy-Precision) rounding the corner on Beacon Hill.

(2) E. H. Armstrong (8 h.p. Armstrong cycle car) on the same hill.

(3) B. Alan Hill (7 h.p. Indian) ascending Whitback Hill, the scene of the flexibility test.

OCCASIONAL COMMENTS

BY "IXION"

Carrying a Golf Bag.

A golfing doctor kindly sends me an excellent reply to the query about carrying a caddie bag on a motor cycle. It only applies to such bags as have straps intended for holding an umbrella. A lamp bracket should be bolted to the front forks, low down near the hub. The loop intended to hold the ferrule end of the umbrella is slipped over this bracket, and the strap designed to grip the handle end of the umbrella is fastened round the handle-bar stem. Provided the umbrella loops are strongly made, this method is perfectly satisfactory.

Some Interesting Accessories.

My parcel post has been unusually interesting of late. *Imprimis*, Best and Lloyd have sent me samples of their latest tank stoppers, adopted by many wide-awake manufacturers. There are two good types, both apparently free from faults and bristling with merit. One has a hinged lid, of which only a milled disc protrudes above the filling nozzle; if you turn this disc, you expand or contract a leather washer which locks the lid in place or frees it—there is nothing to lose, nothing to go wrong. The other is still more ingenious. On the top of the tank you see a huge plated cap with milled edge, which looks for all the world like the ordinary hop-off-over-a-bump stopper till one spots a little hinge at one side. You unscrew this milled cap, and just when you expect it to come away in your hand, it stops turning, and the upper half of it opens like a hinged lid, the lower half remaining locked to the nozzle; here again there is nothing to go wrong, nothing to lose. I have also received a sample of Badcock's by-pass pilot jet. This device renders manipulation of the air lever unnecessary at speeds below legal limit, and enables the engine to be ticked over silently at very low r.p.m. when the clutch is out. My usual objection to these accessories is that they often consist of a multitude of tiny parts which drop off after they have sustained a little vibration; but the Badcock device is staunchly made—evidently the job of a practical rider. It functions well, and I think it well worth the small sum charged for it, provided the joint with the float chamber is thoroughly well made and care is taken in the fitting of the small bore tubing. Next in order comes the Garner whistle, which cleverly dodges the pitfalls awaiting a designer. Its valve is set in a by-pass from the main exhaust pipe, so that no carbon can settle on the moving surfaces when the whistle is out of operation. A little carbon is bound to be deposited in the tube above the valve, and must be carried into the valve when the whistle blows; but the carbonisation is plainly reduced to the absolute minimum, and the presence of a very strong encased spring behind the piston gives promise of the maximum effective mileage between cleanings. The last item I wish to describe is an absolute novelty to me—the Bailey patent locking device, which was originally invented to fasten motor car lamps on their brackets. It is an extraordinarily simple and ingenious little fitting, roughly resembling a letter padlock, and its patentee suggests with justice that it would be an admirable substitute for the key locks now fitted on most motor cycle pannier bags, which occasion such frequent trouble. I have not sufficient space to describe its internal mechanism at present, but if it were fitted to a toolbag, the visible portion would consist solely of a milled and plated disc the size of a penny, and about $\frac{3}{16}$in. thick. This disc would be situated where the present key locks are mounted. Round the rim of a small fixed central spindle on which the milled disc revolves several letters or figures would be stamped—any number of them—according to the size of the fitting: and from the milled edge a small set screw would project. Neither dust nor blows can possibly injure the affair; no outsider would have any conception how to release the lock, and a person familiar with its operation would have to make a number of attempts to open the bag, unless he knew to which letter or figure it was set. If any reader is commercially interested in this clever little patent, he should communicate with Mr. Bailey, 2, Spring Lane, South Norwood.

Durability of Leather Belts.

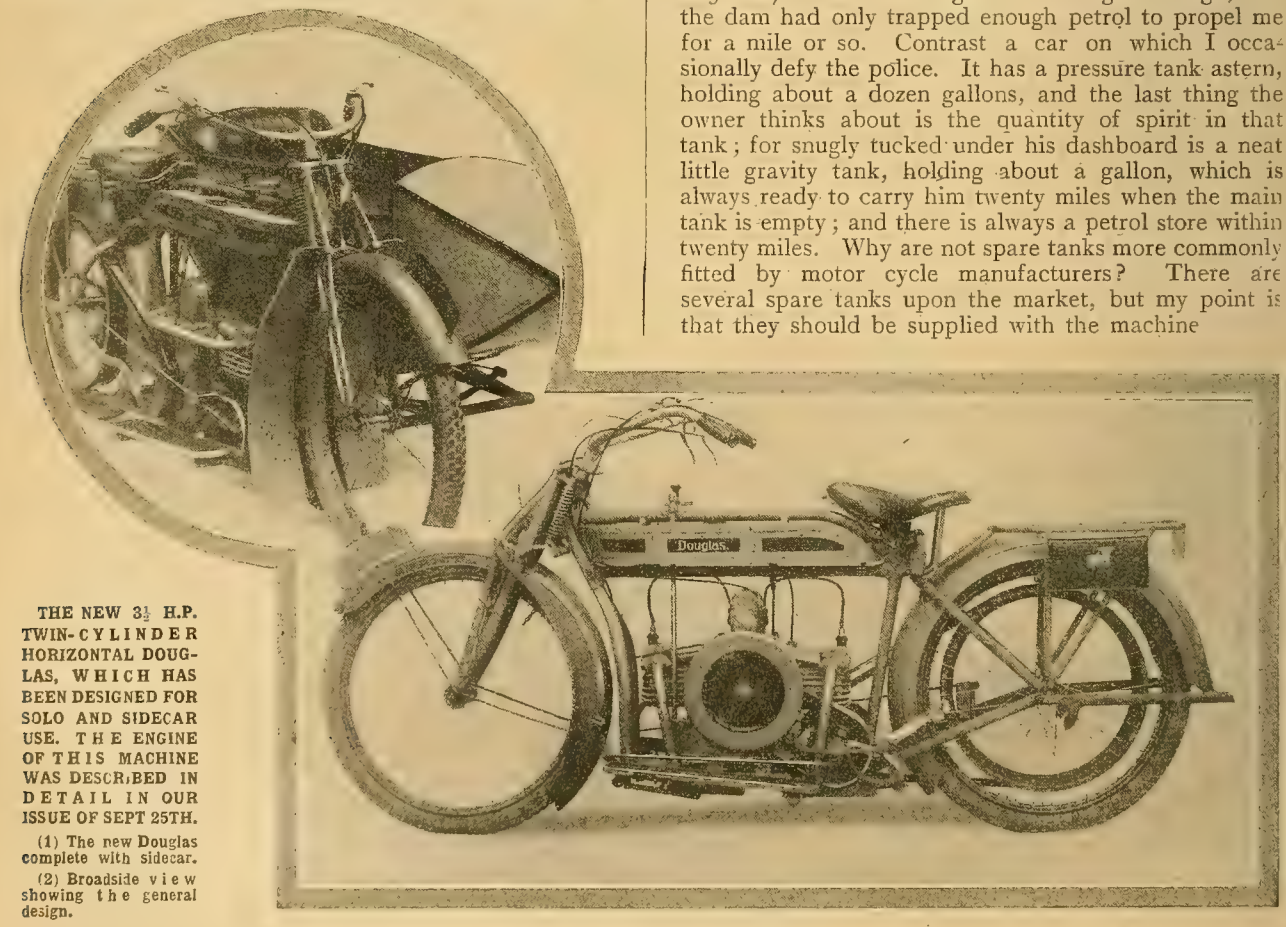
A correspondent who keeps a watchful eye on his motor cycling expenses asks me to emphasise the superior economy of leather belts, which he apparently considers have been rather unduly overshadowed of late by the rubber variety. His point is that when a leather belt develops a bad patch, it is usually possible to splice in a new section, but that when a rubber belt turns measly for a few inches, the entire belt is ruined. His implication is that impecunious motor cyclists would do well to prefer leather. I must speak humbly, for during the past few seasons I have only carried a leather belt on the chance of my rubber belt developing chronic rainslip, but my impressions are that it is quite possible to exaggerate the economy of leather. The belts themselves unquestionably outwear rubber, but they rub a shoulder on the pulley in quite a short time. Further, a fastidious rider is not likely to run far on a spliced leather belt. The width of the older portion of the belt will not be standard, but will have worn down to some between size, and the insertion of a new piece, which is, say, $\frac{7}{8}$in. dead, will introduce a little snatch and jerk into the drive. Moreover, it is possible to patch a rubber belt, either by inserting an extra fastener, or by cutting out the damaged portion and fitting in a length of new stuff. Few riders would do this, it is true; and their reluctance arises from precisely the point I mentioned anent

Occasional Comments.—

splicing a leather belt, that it may spoil the smoothness of the drive. On the whole, I do not doubt that leather belts are a shade more economical, on the average, than rubber, provided the word "economy" is used in a purely financial sense, without reference to expenditure of time or temper; but I doubt whether the saving is large enough to make a strong appeal to any but the most impecunious. *Per contra*, however, I must admit that there is upon the market more than one leather belt of remarkable pliability. Such a belt is much more suitable for a lightweight machine with a very small pulley than the average rubber belt.

Petrol Gauges that Don't Gauge.

I know I am a miserable faddist, but is it too much to beg the trade to tax its brains yet a little further in the direction of petrol gauges? We submitted meekly for years to the vertical gauges inset in the tankside, which registered fairly accurately the amount of fuel remaining in the tank, but failed to cope with our ineradicable laziness in that we couldn't accept their most desperate warnings unless we dismounted for the purpose. Personally, being a happy-go-lucky Celt, I never dismounted till the tank was dry, and the infernal gauge could only offer that most aggravating counsel "I told you so!" The dawn of 1913 brought a return to the old cork-cum-twisted-strip arrangement, which I first beamed upon in the tank of my Ormonde about the year 1901. I say "beamed," because I really did beam when I first saw the contraption at a Stanley Show, but afterwards I often glowered on the lying dial, which seldom registered with any precise accuracy at either the "full" or "empty" extreme, and jumped about enough to give one the giddy jim-jams on a rough road. How often have I not leapt off the saddle and torn out my stopper to find that dial was lying. I hoped the 1913 imitation would prove mysteriously superior to its original prototype, but I have been disappointed. It is probably a shade better than the invisible tankside glass, but it isn't really quite the goods. Once again I thought I had struck oil when I bought a machine with a partitioned tank. It read beautifully in the catalogue. "When the machine stops for want of petrol, dismount and raise the front wheel, so as to allow the reserve of petrol to run over the partition into the rear portion of the tank." When I got this machine, I rode blithely without counting the miles to the next petrol store. Then came a day when, after a few preliminary sputterings, the engine stopped—ten miles from a garage. With a smile I hopped off and elevated my front wheel about four feet off the road and then attempted to restart. After the tenth fetch-up on the dead centre of full compression, I breathed heavily, removed my stopper, and gave the glad eye to a faint moisture in the tank bottom behind the dam. I elevated the front wheel to the limit this time, and severely ricked my internal apparatus in the process, for the machine was of the 160 lbs. variety (catalogue rating; A.C.U. Trials rating, about 225 lbs.) This time I got a start right enough, but the dam had only trapped enough petrol to propel me for a mile or so. Contrast a car on which I occasionally defy the police. It has a pressure tank astern, holding about a dozen gallons, and the last thing the owner thinks about is the quantity of spirit in that tank; for snugly tucked under his dashboard is a neat little gravity tank, holding about a gallon, which is always ready to carry him twenty miles when the main tank is empty; and there is always a petrol store within twenty miles. Why are not spare tanks more commonly fitted by motor cycle manufacturers? There are several spare tanks upon the market, but my point is that they should be supplied with the machine



THE NEW 3½ H.P. TWIN-CYLINDER HORIZONTAL DOUGLAS, WHICH HAS BEEN DESIGNED FOR SOLO AND SIDECAR USE. THE ENGINE OF THIS MACHINE WAS DESCRIBED IN DETAIL IN OUR ISSUE OF SEPT 25TH.

(1) The new Douglas complete with sidecar.

(2) Broadside view showing the general design.

What the Show will Reveal.

Points in Design which may be expected on Next Year's Models.

THE few weeks before the Olympia Show are in many ways the most interesting in the motor cycle year, for the new models are coming before the public eye, and by the time the doors of Olympia are opened to us, our appetites for the good things provided for the year 1914 are exceedingly keen. Every year we hear rumours of finality in design being reached, but these are idle tales, and probably we are as far from finality nowadays as we were ten years ago when *The Motor Cycle* was in its infancy. Indeed, in some ways further, for then we had only one type of engine to consider—the four-stroke, whereas now the two-stroke has seriously invaded the field, rather more so, in fact, than the numbers actually met with on the road would indicate, for many of the big firms are spending much time and money in careful experiments with this type of engine.

Cleanliness a Cardinal Virtue.

But apart from engine design, there is plenty of room for improvement in details, and these should chiefly tend to making motor cycles more weatherproof and more flexible for traffic work. In the former department of design, chain cases which absolutely exclude wet and retain lubricant should be provided on all chain or chain-cum-belt-driven models, and we look forward to a very general advance in this matter. Protecting belts is by no means so simple, chiefly from the difficulty of good appearance, but one firm has already tackled the problem with fair success. Bigger mudguards, for which riders have long clamoured, will be fitted on many machines, and already we have had an advance view of some very admirable efforts in this direction. It is, of course, an absolute impossibility entirely to protect the rider in bad weather on a fast moving vehicle so low on the road as a motor cycle, but up to the present manufacturers have been rather too content simply to enlarge on pedal cycle mudguard practice. Dropped frames and inverted handle-bar levers may now be said to be standard practice on all up-to-date machines, and we observe that one or two makers who have not adopted the dropped frame for this year will come into line in 1914. Petrol capacity, too, is being increased, and not before such a move was wanted.

Transmission and Controls.

This vexed question will certainly not be settled finally next year. There will be almost equally powerful schools of design which favour in nearly equal proportions simple direct belt, chain-cum-belt, and all chain transmission. From certain observations, we rather think that the most noticeable advance will be found in the chain-cum-belt type of transmission. This type allows either a hub or counter-shaft type of gear to be used, gives a good deal of elasticity to the drive, and practically abolishes belt slip and rapid belt wear. Its only drawback is the nearness of the belt centres, but the large pulleys employed to a great extent minimise this rather more theoretical than practical drawback. With regard to the infinitely variable belt drive type of gearing great improvements have been effected, and in future ratios as low as 12 to 1 will be obtainable. To all chain drive, the growing popularity of the 500 c.c. twin will give a long lease of life. With a twin there is no shock to speak of compared with a single, and unless a good slipping clutch be embodied, a 500 c.c. is apt to wear the high speed chain with undue rapidity. A point to render driving more comfortable, and one ofttimes urged in *The Motor Cycle*, is the provision of a pilot jet to the carburetter. The extraordinary smoothness of running at slow speeds of a certain very popular twin has brought this accessory much to the front, and next year we may expect to see a number of carburetters so equipped. By this means traffic driving, in particular, will be vastly more pleasant. Combined with a three-speed gear of the counter-shaft or hub type, any machine should really be able to do what enthusiasts so often say they can, "tick over." And while on the subject of controllability, may we put in a plea for standardised handle-bar control for brakes and exhaust lifters. It is very annoying—and to the novice even dangerous—to ride for a time a machine with brake lever on the right and then go suddenly on to a machine with the same control on the left grip.

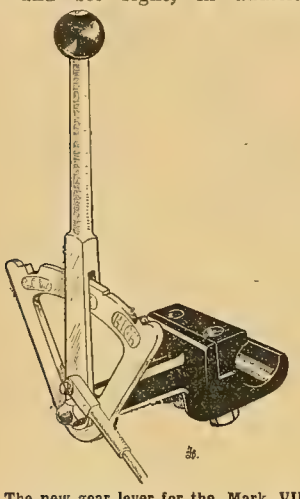
The Happy Mean in Engines.

Nearly everything in this world is in the nature of a compromise, and the motor cycle engine is no exception. Not many riders can afford to keep more than one machine at a time, and therefore they naturally turn to the one most likely to give the best all-round service. And nearly every one, at some time or another, wishes to take a passenger and a sidecar. Now the ordinary 500 c.c. machine is a little on the small side for such work, while the big twin is unnecessary for solo work, and the vast majority of riders still prefer the simplicity and efficiency of the single for all-round work. Therefore a demand has lately sprung up—and to a certain extent has been met—for larger single-cylinder engines. We believe that this demand will increase, and already we hear of some notable newcomers to this class. An engine with a cubical capacity of, say, 600 to 700 has the further advantage beyond power, in that it is not necessary to keep it in such perfect tune as its 500 c.c. little brother, owing to its natural reserve of strength, and it is also likely to be more long-lived in its "innards" owing to those organs not being so frequently stressed. We believe that the "big single" has an enormous future before it. Such a motor, if fitted with forced feed lubrication, would be practically everlasting. One great refinement we may look for in the near future is electric lighting. Already we hear of a famous machine to be so fitted, and when a dynamo electric lighting outfit is installed, night riding will be robbed of half its bothers, although acetylene gas may give a more powerful light.

The New Armstrong Mark VII. Gear.

Some Internal Features of Construction. Suitable for High-powered Machines.

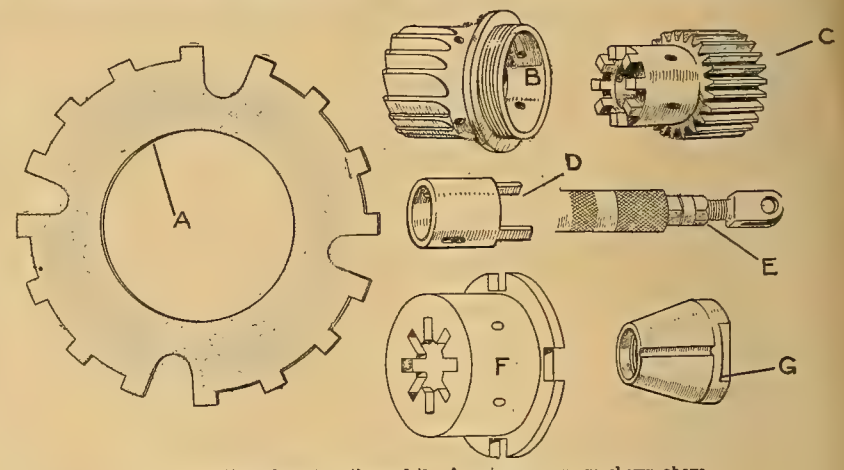
THE popularity of the Armstrong hub gears can be gauged by the large number to be seen at any gathering of motor cyclists, and it may be imagined that Messrs. the Armstrong Triplex Three-speed Co., Ltd., are keeping thoroughly up to date. The latest of the firm's products is the Mark VII. gear, which was shown to us in detail during a recent visit to the works. The new gear is in no way an experiment, but is the result of long experience in the manufacture of three-speed hubs, and is a perfected model of the Mark VI. gear, which is already well known. The performance of the Mark VI. hub has been very carefully watched, and the slightest defect traced to its source and set right, in addition to which all parts have been considerably strengthened and rendered as fool-proof as it is possible for so compact a piece of mechanism. Great attention has been paid to the lubrication question, and oil holes and leads have been arranged wherever necessary.



The new gear lever for the Mark VII. gear. The Quadrant is fixed to the lower tank rail and the long lever forms a very comfortable method of changing.

The clutch area has been increased 150%, the plates are now made of blue pen steel, and the clutch carrying member is held up to its work by a powerful coil spring. This latter feature is important, as it removes the possibility of clutch slip through over-screwing the nut which previously took the place of the spring. Another innovation is a ball thrust ring which is arranged to take the thrust of the clutch springs, and thus save a certain amount of friction. The substantial construction of the new gear may be judged from the appended line drawings and photographs, which show the improvements in some of the more important parts. The gear cross key has been doubled in strength, the clutch springs and control spring are longer and more flexible, and the adjusting cones improved so as to give a more delicate adjustment.

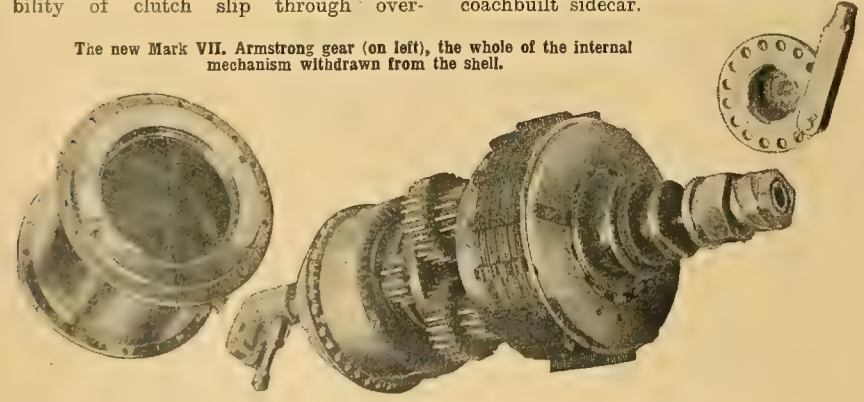
The hub is ½in. wider than the Mark VI., and requires 6¾in. between the fork ends; controls have been strengthened; the new change-speed lever is long and works in a large quadrant, making gear changing very easy and convenient, while the quadrant has a neutral position for adjusting purposes, which considerably simplifies the operation. We obtained excellent service from a Mark VI. gear during the past year, and have already a machine fitted with the Mark VII. which has required no attention during its first 300 miles, though fitted to a 6 h.p. twin-cylinder machine with coachbuilt sidecar.



Several of the enlarged portions of the Armstrong gear are shown above.

A. Clutch plate with oil pockets.
B. Cog driver with lubrication holes.
C. Medium size pinion which has increased bearing surface.
D. Strengthened axle collar.
E. Stiffened gear adjustment.
F. Leg clutch, the elongation of which permits the use of a longer and stronger clutch spring.
G. The new cone which gives finer adjustments.

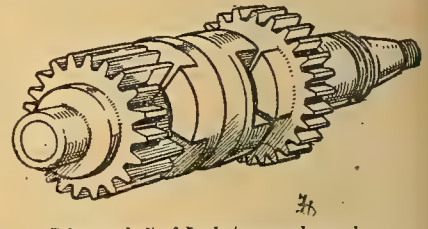
The new Mark VII. Armstrong gear (on left), the whole of the internal mechanism withdrawn from the shell.



A NEW LEVIS TWO-SPEEDER.

As a result of the successes of the 2¾ Levis during the past year, this model, which was originally designed for the Tourist Trophy, will be standardised in a modified form for next year. The bore and stroke will be 75 × 79 mm. respectively, and plain bearings will replace the rollers; the separate head will also be done away with.

A simple counter-shaft two-speed gear box has been designed, and will, in future, be fitted on request. The gear is of the sliding dog type and is solidly constructed. A very simple clutch on the expanding brake principle will shortly be ready, and will be contained in the fly-wheel, thus permitting existing types to be converted to free engine machines. The extra weight is small and the price low.



Primary shaft of Levis two-speed gear box.

The well-known Baby Levis will, of course, be marketed, and the 2¼ model will remain unaltered, except for an increase of three millimetres in the bore. A very novel engine is being constructed for aeroplane purposes, the details of which we are not yet at liberty to publish; it will be rated at 35 h.p.

Those who have seen Mr. Tom Davies, a well-known variety artist, performing in "motor cycling in the air" will be interested to hear that he has ordered four 2¼ Levis machines for his performance.

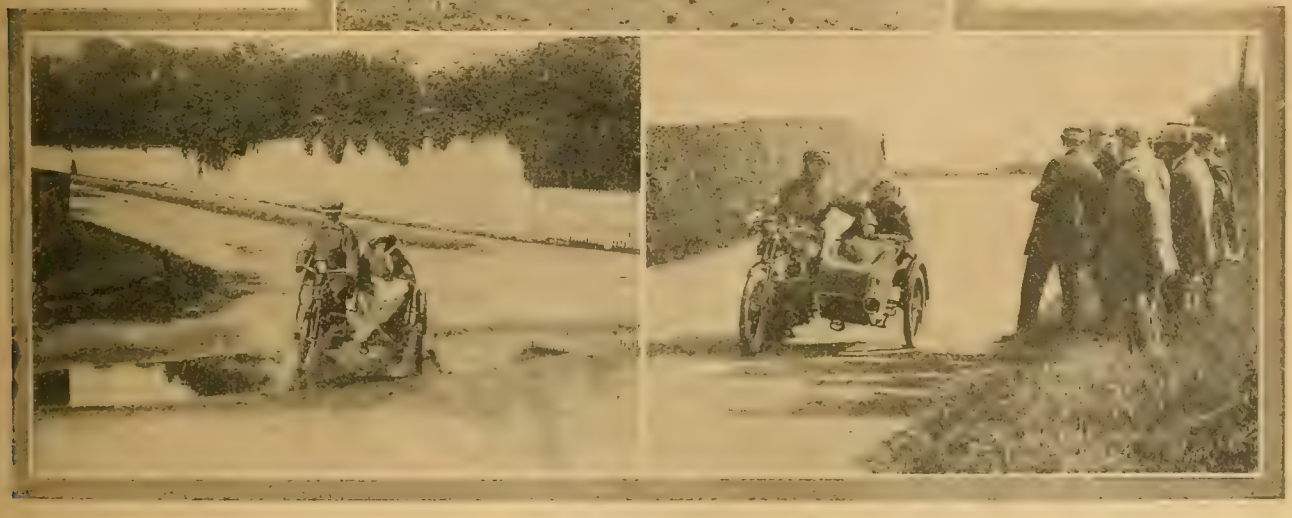
The Choice of a Sidecar Outfit.

By ROAD RIDER.

DESPITE the competition of the cycle car, sidecars are booming as they never boomed before; and they will boom more than ever when the next Olympia Show is over, because the standard bicycles of 1914 will be more admirably adapted to sidecar propulsion than their noblest predecessors. Novices may therefore welcome a few hints on the choice of a motor bicycle which is intended to drag an extra passenger.

The first question is that of horse-power. From this standpoint machines fall into two classes. The 2¾ h.p. class may be ignored, as it is only suited to clever riders in the easiest possible country, and is seldom sturdy enough to take an attachment. The big 8 h.p. machines may be left to those for whom money is no consideration and pace a great attraction. For the ordinary man the two horns of the dilemma are the 3½ h.p. and the 750 c.c., which is usually rated at "5-6 h.p.," though it should actually develop rather more. The 3½ h.p. can claim the advantages of simplicity and of economy. Its failings are that it is a trifle slow in hilly country or when a strong wind has to be faced throughout the run; and that it cannot be relied upon to take a loaded sidecar up absolutely any hill. The 5-6 h.p. permits of a faster average speed, and should ensure the conquest of the most abnormal gradient with the passenger seated in a normal position, but it is very distinctly more costly to run, and it presents more complex problems to its owner on those rare occasions when the engine behaves like a naughty child. Let us go more closely into the question. The real crux is that we must weigh the superior capacity of the 5-6 h.p. against the greater economy of the 3½ h.p.; and the answer depends chiefly upon what the 3½ h.p. can do in ordinary hands.

Driven by men like Marston, Haswell, or Bischoff, a 3½ h.p. sidecar outfit can do almost anything; and it must be remembered that all these men ride the 3½ h.p. by choice. They can all afford an 8 h.p. machine, if they prefer it, and I believe I am right in saying that they have all driven many miles with sidecar outfits of high power. The "chanciness" of the 3½ h.p.



A YORKSHIRE SIDECAR TRIAL.

(1) In the water-splash at North Grimston, which is immediately followed by a stiff hill, which usually causes drivers of belt driven machines much anxiety.
(2) Another sidecar charging a water-splash during the recent B.S.A. trial in Yorkshire. (3) Crossing the finishing line.

The Choice of a Sidecar Outfit.—

seems to make a keen appeal to their sporting instincts. They know there is a very distinct "if" about things when they tackle a freak hill, if not on the first day of the trial, at any rate on the fourth or fifth day, when the engine is getting a little carbonised, and some of the vital tuning adjustments have worn the edge off their original delicacy. In a word, there is nothing sporting about climbing hills with 50% of your power in reserve; and some of the crack riders adore the gamble of rushing at Amulree with only 500 c.c. under their tanks. On the other hand, we have to remember that such men probably obtain one of those "star" engines which mysteriously appear among each batch of 100 nominally identical duplicates passing out of a factory. They are adepts at tuning these engines, and tuning for freak sidecar performances is a special art, a little removed from tuning a solo mount. They are up to every trick on the board.

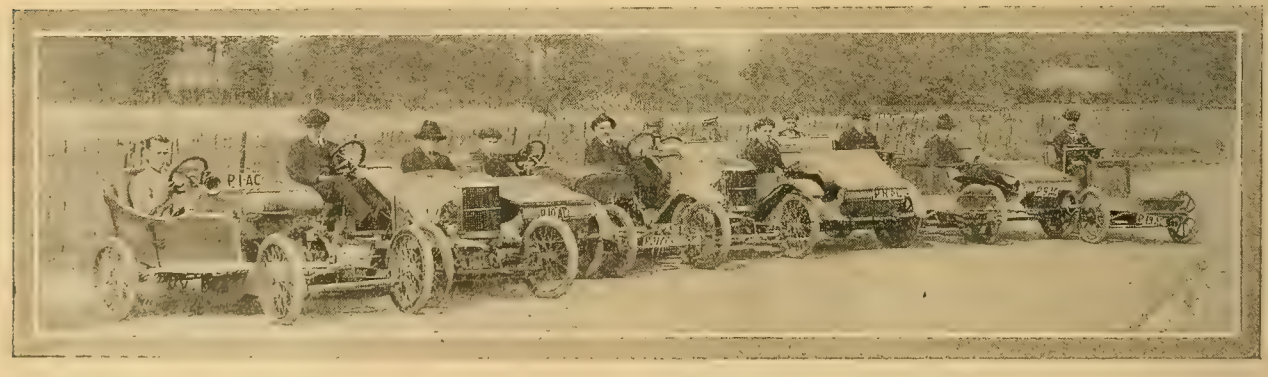
The 500 c.c. engine develops a little more power to-day than its predecessors of 1912 and 1911, but I have known sidecar experts drain their crank cases at the foot of every big hill in a trial, inject four, six, or eight pumps on their way up, and drain out the surplus at the top through a special orifice reamered out generously for the purpose. I have known them employ gear ratios so low that they were hardly applicable for ordinary touring purposes, and there were days when the sidecar crack thought nothing of carrying half a dozen belts in a week-long trial, and tugging the heart out of each of them. Furthermore, it is not everybody who can drive as the experts drive. Have we not seen the crack top the mile of gradient with his engine beats sounding out reluctantly at long intervals—one a minute or so, it felt like—and do we not know the amateur whose engine stops as soon as the pace drops below fifteen miles an hour against a grade? We may be courageous and hopeful, but we must not rely on equalling these record performances.

3½ h.p. Sufficient for Practical Purposes.

But the verdict is not given against the 3½ h.p. sidecar because we have no hope of coaxing it up Countisbury or Amulree. Great Britain is covered by such a network of roads that no tourist is compelled to take all the freak hills in his route. We can visit all the beauty spots of our islands without facing a single genuinely formidable hill. We may be content to arrange our touring so that we eschew the mountainous counties altogether, though this is a coward's policy. But it is not all the world if our 3½ h.p. outfit will not take two up the twenty or thirty really stupendous main road hills. It can be trusted to take one up. In private touring, we are not tied to a fierce time schedule. It does not matter in the least if our first rush dies out half way up; we can drop the passenger and set him, or her, to tramp to the summit while we return to the foot and make a second rush solo; there are very few hills on which both driver and passenger must dismount from a 3½ h.p.; in fact, I believe that Kenmore side of Amulree is the only climb which I have seen empty both chair and saddle of a crack 3½ h.p. with a good man up [Hugh Gibson made a clean ascent on a 554 c.c. sidecar with passenger seated in the Scottish Trial this year.—ED.], and thank goodness we do not meet Amulrees up every by-road. So—provided the passenger is equal to an occasional mile tramp up a stiff hill—the 3½ h.p. is quite usable for go-anywhere touring, though the 5-6 h.p. is much pleasanter in districts where the climbing is almost continuous.

Driving and Equipment Hints.

There are a few details which deserve meditation. A two-step drive, whether it consists of two chains or a chain and a belt, is less troublesome than a plain straight through belt. Sooner or later the day will come when the engine is out of tune, rain is teeming down, and a bad hill towers ahead. Under these circumstances the belt may slip so badly that the entire outfit may have to be pushed from the bottom to the top. A two-step drive affords a large belt pulley, on which the belt almost invariably grips well. Three speeds are much better than two, especially with a 3½ h.p. It does not take so much weight, wind, and gradient to bring a 3½ h.p. outfit off its top gear; and it is dull work grinding up a long two mile slope on a gear of 10 to 1 or less. A 3½ h.p. gives of its best when equipped with a light cane body, destitute of hood or screen, and driven by a man who keeps the weight and bulk of the luggage down to the minimum. A cabriolet body de luxe should be reserved for a 750 c.c. or 1,000 c.c. Finally, the 3½ h.p. sidecar man should gear low—5 to 1 is plenty high enough for top, and the driver should be extremely liberal with the lubricating oil.



A.C. testers in the various types of cycle cars produced by Auto Carriers Ltd., comprising the single-cylinder three-wheeled vehicle in industrial and pleasure capacities, the new four-cylinder four-wheeler and the single-cylinder four-wheeler.

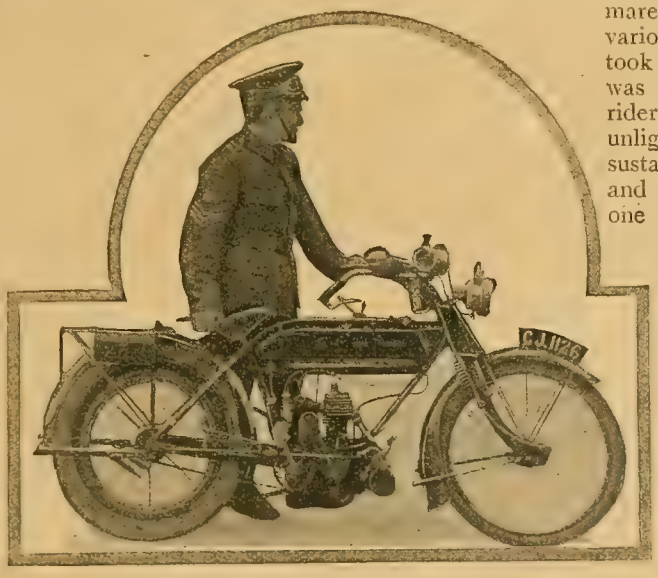
ON MANŒUVRES.

EXPERIENCES OF A MILITARY MOTOR CYCLIST.

HAVING volunteered through the A.A. and M.U. for services in the recently concluded manœuvres, on September 19th I received a letter from the War Office ordering me to report for duty to the officer in charge of the Neutral Signals at Aylesbury before 4 p.m. the next day. So accordingly Saturday, the 20th, found me approaching Aylesbury in the neighbourhood of three o'clock. Upon reporting for duty at headquarters I was assigned a room at one of the hotels, where I experienced no small difficulty in getting received. The proprietor, after escaping from an officer who kept on remarking, "I see 'garage' put up, but can't see anything more," actually informed me he wished I would go somewhere else. However, by a steady refusal to take "No" for an answer, I at length obtained a half share in quite a comfortable room by the kind consent of the other occupant, who was engaged in the same work as myself.

The Work on Manœuvres.

On reporting a second time for duty at 6 p.m., the nine of us attached to the Neutral Signals were divided into shifts of three, to be on duty for periods of four hours at a stretch, followed by a like period of absolutely free time, followed by another stretch during which we were to be near at hand in case of emergencies. I was in the first shift on duty from 8 till 12 p.m. At ten we were dismissed with the assurance we should not be wanted for another eight hours. This, however, proved to be a false rumour, for no sooner was I properly asleep than the quartermaster-sergeant, at 12.30, woke me up with a message from Bushey Hill, near Watford, the headquarters of the Brown Force. So after knocking up various unfortunates in attempts to get my machine out of the garage, where it had been locked up by someone ignorant of the ways of the Neutral Signallers, I finally got started about 1.20 a.m. After a lovely moonlit ride, I finally arrived at my destination at 3 a.m. On arrival I found the R.E. in full possession of the main corridor as both workroom and sleeping quarters—a cause of no small embarrassment to some ladies returning late from a dance that night. The R.E. welcomed my message, and nothing could be kinder than the welcome they gave me personally, so after a much appreciated sleep on a couch in their quarters and some refreshment, not to mention a fill up with petrol, free from a friendly A.S.C. captain, was able to get back to Aylesbury for breakfast.



"John de Balliol," the writer, and his New Hudson.

Spills, Skids, and Collisions.

There I found that disaster had overtaken one of my colleagues—the sharer of my room, in fact. An elated Tommy had executed a step dance in the middle of the road in front of him with most disastrous results, in the shape of two black eyes and a damaged nose to the rider and badly bent forks and lamp bracket to the machine; the Tommy seemed to have got the best of the encounter, escaping with a damaged knee. While on the subject of spills, it is interesting to note that out of the six who were on duty with the signallers to the finish, only the writer escaped without a spill of some sort, and he made up for it by three skids in 200 yards in Worcester, where tramlines, stone sets, worn tar, and steep camber all combine to make the town a perfect nightmare in wet weather. Of the various adventures which overtook the others, the most notable was the collision of a Humber rider on a foggy night with an unlighted lamp post—damage sustained, buckled front wheel and five spokes smashed, all in one place. However, the rider was not daunted, but in the small wee hours of the morning he there and then took out his front wheel and stamped the rim into a very close approximation to the spherical, stopped the gap made by the collapse of five successive spokes by taking sound ones from other parts of the wheel, and after this repair he went through the whole remaining six days with no further repair than the fitting of the necessary new spokes—surely a striking testimonial to the workmanship of those particular rims.

Some Praise and a Grumble.

I have nothing but praise for the behaviour of my little J.A.P.-engined New Hudson throughout the 661 miles I covered during the seven and a half days I spent in actual work and in riding to and from my home. In spite of miles of middle and low gear running, past troops and over vile roads, I never had any signs of overheating (in fact the hotter it got the better it seemed to go), nor was there one single misfire except one day when my wet Burberry kept brushing the plug much to my mystification till I caught the criminal, so to speak, *in flagrante delicto*. Indeed, over what was, in fact, a prolonged reliability trial I had absolutely no trouble whatever. My Armstrong gear throughout gave me every satisfaction. Perhaps I might add one word of advice to riders of this machine fitted with a B and B. standard carburetter, and that is, "take your choke tube out if you have

On Manoeuvres.—

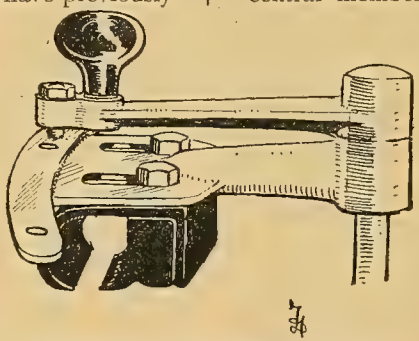
the standard jet still in." Mine was a 31 and the improvement was remarkable. I might perhaps best describe the week in Jake de Rosier's words—"This is no tea party." On the other hand, I have always found tea parties very poor sport indeed. Financially it works out that after paying all out of pocket expenses there is about £3 more or less to cover wear to belt and tyres and general depreciation to machine. In my case this worked out roughly 1d. per mile—hardly a generous allowance. The Government should be made to realise that motor cycles are very expensive and fairly delicate pieces of machinery, and that patriotism alone will not lead men to sacrifice both themselves and their time and to risk their machines when not even compensation for wear and tear and insurance against accidents are given to them by the authorities. Enough, however, of grumbling. The kindness and courtesy shown to us by all ranks of the Regulars, officers and men alike, was proof enough that those on the spot did not fail to appreciate any small services we may have been able to render; and if the work was strenuous—what of that? Surely that, too, was in its way a compliment, because only the willing and useful horse gets worked hard, and the work is also tremendously interesting, exciting, and healthy.

JOHN DE BALLOIL.

A DING DONG RACE AT BROOKLANDS.

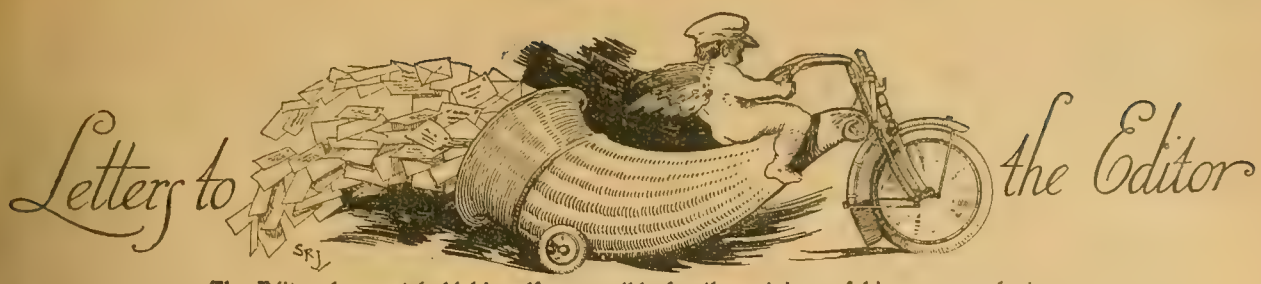
A Counter-shaft Two-speed Gear.

MESSRS. HARRIS AND SONS, of Upper Highgate Street, Birmingham, who have previously confined their gear designs to the epicyclic or revolving type, are marketing a neat counter-shaft two-speed gear suitable for fitting to many existing machines. The model shown to us has no clutch, the change-speed being effected by dog clutches only. The primary shaft runs on ball bearings, is fitted with a chain wheel for the first drive, while a large belt pulley is used for a final power transmitter. Five dogs are cut on the faces of the gear wheels, each being slightly under cut to prevent slipping out of engagement. The central member is slid from side to side by a fork mounted on a sliding rod, which, in turn, is controlled by a horizontal lever attached to the top tube. The layshaft revolves on a long stationary spindle, a bronze bush being interposed and drilled with copious oil holes. The complete gear is enclosed in a neat aluminium casting and attached to the frame by a substantial clip. A lubricator is fitted into which an oil gun can be introduced with ease. The gear and fittings are well made, and will be sold at a very moderate price.



Change speed control of new Albion two-speed gear.

The new Harris counter-shaft gear shown dissected and complete for fitting.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Shipping to Lagos.

Sir,—I should be much obliged if any of your readers who have been to West Africa could let me know if a tin-lined case is necessary in which to ship a motor cycle to Lagos. I am told that there is risk of damage by sea water in landing unless the case is tin lined. It seems an unnecessary expense if this is not so. F.C.M.

[Replies addressed care of *The Motor Cycle* will be forwarded. —Ed.]

A Curious Case.

Sir,—The cause of a peculiar firing back into the carburetter of my brother's machine baffled us for many days, and as we thought the matter rather strange, I have written to you so that perhaps some other motor cyclists might benefit from the explanation. I will put the case as shortly as possible.

Much intermittent firing after one big pop in the carburetter made us think that premature ignition was caused, and we were led to believe that the Bosch magneto was giving two sparks. This turned out to be the case, and the following explanation, I hope, will be clear.

The contact breaker casing was worn rather on the end boss of the magneto. So much so that the points of the breaker varied in distance apart as they moved round. This was due to the eccentricity of the casing and the contact breaker, which caused the points to touch again and break a second time towards the end of the cam piece, thus causing a second spark at the plug points and somewhere near the beginning of the suction stroke. Hence explosion when valve was open and intermittent firing.

A new contact breaker casing and end plate put matters right immediately. The trouble may not be new to you, but it struck us all as being most novel.

IVAN P. MILLAR.

An Undesirable Practice.

Sir,—With J. A. Allen I was surprised to read your leader on pillion seat riding in *The Motor Cycle*, though, perhaps, from a different cause.

During the last two years I have ridden 4,000 miles with a passenger on the carrier of my 3½ h.p. Ariel, and up to now I cannot attribute a single mishap to the "undesirable practice."

I have a sidecar, but the only time I have used it this year was when I was going a week's tour, and even then I was so disgusted with sidecaring after riding "undesirably," that I uncoupled after the first day and called for the sidecar coming home.

My friends, who have tried both methods of locomotion, are unanimous in voting the pillion seat the better method, while, as for hill-climbing, my machine romps up hills it would not look at with a sidecar.

From my experience, I conclude that, with care, carrier riding is quite as safe as sidecaring; and, for cornering, safer.

I have never had a skid, but your repeated warnings of this danger make me rather nervous when riding on wet roads.

In conclusion, do you think that to prohibit a practice, which, on your own showing, has "become enormously popular," would be altogether a good thing for the pastime?

HARRY SPENCER.

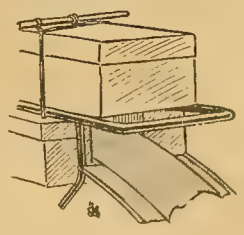
Sir,—With reference to Mr. J. A. Allen's letter, in your issue of the 2nd inst., relative to the above, I think he rather misses the point. I take it that not many people, except his circle of friends and relations, care very much whether Mr. Allen breaks his neck or not, but immediately he begins to endanger the necks of other people, then it is time for the law to step in and say what he (and, incidentally, others) shall or shall not do. How many of the fair carrier riders know the risk they are running, especially on a greasy road? Not many, I warrant, until the smash comes; and after that they are lucky to be alive to renounce their favourite pastime. Not only is the practice dangerous to the participants, but to other users of the road, in that, unless the passenger is skilled in the art, the stability of the machine must be, to a certain extent, upset—at any rate on grease. Mr. Allen refers to flying—I quite agree with his sentiments as expressed—but supposing one of the intrepid airmen was to start his evolutions over the city of London, say, what then? Would Mr. Allen condemn the practice? (I know that a law has been passed forbidding flying over congested areas, but I have taken the above more as a figurative example than anything else.)

In conclusion, I hope you will continue to set your face against a practice which, I feel sure, the main body of motor cyclists look upon as dangerous in the extreme.

LT 2734.

Tying on Luggage.

Sir,—In order to tie luggage on a motor cycle so that it will not move, pass an ordinary piece of cord round the luggage and carrier with loops at each end. Through these loops pass a fairly strong piece of wood, say 12in. long, twist the cord until it is quite tight, and then tie the end of the stick to one end of the cord, or have a small iron ring which can slip over the point of the wood. By making this tourniquet the cord can be tightened so that it would cut into your luggage.



I hope this idea will be of use to somebody. I enjoy reading your paper very much, and have done so for some time. I ride a Motosacoche, but we have very bad roads.

Argentine Republic. H. DANDRIDGE.

Power for Sidecar Work.

Sir,—As there appears to be uncertainty in many minds as to the reliability and capabilities of 3½ h.p. cycles with sidecar in the hands of ordinary beginners, starting with a new machine, perhaps my experience may be of some interest.

At the end of June, 1912, I got a 3½ h.p. Phelon and Moore with sidecar, and after a month learning to drive I took it for a tour in Scotland and the Lakes with passenger and baggage. In September we crossed to France passing through Paris, Clermont Ferrand, over the Auvergne Mountains to Carcassonne, and thence through the Esterel to Nice and Monaco, and home again over the Alps.

crossing Cols 4,500ft. high and hills eight miles long, without trouble or mechanical worries.

This year in June we took another Scotch trip, and in August another 2,000 mile French tour, the route of which was Boulogne to Rocroi, and through the Vosges to Nancy, etc., and following the frontier through the Jura to Bellegarde and Grenoble, thence up the Oisans, and over the Col de la Croix de Fer to S. Jean de M. about 4,500ft., to Pralognan 4,500ft., then to Val d'Isère 6,000ft., and over the Jura Mountains home. This completed over 10,000 miles in fifteen months, a great many of them amongst mountains.

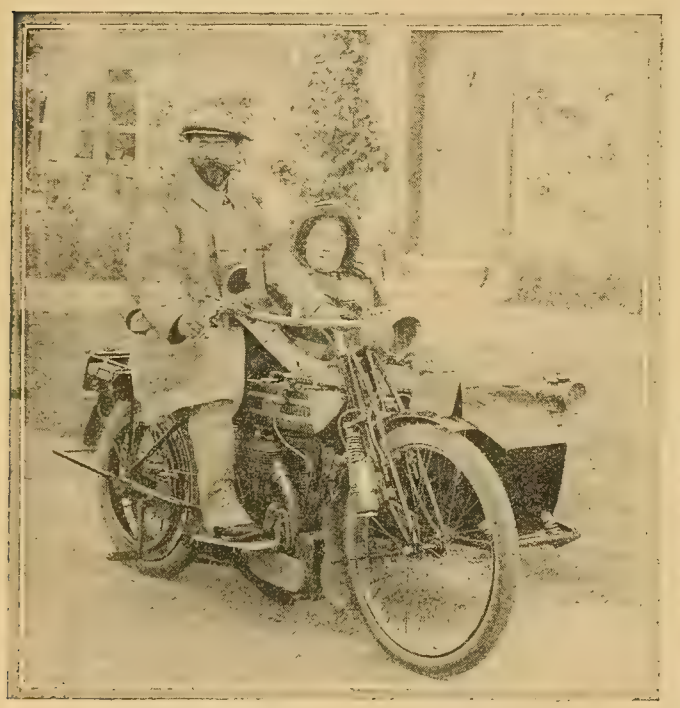
Petrol consumed for 2,004 miles was twenty-four gallons or 83½ m.p.g., and the gear chains ran over 9,500 miles before renewal. The gear has never refused to work, and the foot starter is most reliable. Of course, adjustments must be made, but again next year I hope to start off abroad for a month or six weeks carrying all baggage and spares, and shall do so without the least anxiety.

I have no interest in Messrs. Phelon and Moore, Ltd.

H. PORRITT.

An Enthusiastic Sidecarist's Advice.

Sir,—As an old reader of your valued paper, I have seen various letters and photographs published from other readers detailing their experiences with motor cycle and sidecar for pleasure purposes. I have lately bought a machine, and can now realise the pleasures of motoring. I have done 2,000 miles in three months, spending my holidays



H. Baker (Ivy-Precision sidecar). See accompanying letter.

in Wales, then I undertook a tour of eight hundred miles without the slightest trouble. In my opinion, there is nothing to come up to a motor cycle and sidecar.

There must be many, like myself, who fear to ride solo, and who would be motorists, but cannot make up their minds, and to them I say get a motor cycle and sidecar. Their pleasures will begin.

H. BAKER.

Benzole.

Sir,—I am sending you a few facts about benzole for the benefit of those of your readers who are interested in its use.

"Benzole" or "benzene" is a name applied to a hydrocarbon obtained (with many other compounds) from the destructive distillation of coal and certain oils, but chiefly coal. When pure it boils at 176° F. and freezes at 32° F to a colourless solid. The liquid is without colour, and has a specific gravity of .884 (water being 1.0). It must not be confused with "benzine," or "benzoline," which is a hydrocarbon of different constitution, and is a product of the distillation of petroleum and akin to petrol.

It is at once evident from the above that pure benzole is not suitable for an ordinary carburetter except in hot weather. Commercial benzene is sold at 90% and 50% strength, but these figures are misleading; they refer to certain standard distillation tests. 90% benzole would contain about 78% pure benzole, the remainder being chiefly toluol and some xylol hydrocarbons of much higher boiling point (230° F. upwards), but possessing the property of remaining liquid under 80° of frost. Consequently, 90% benzole will keep liquid at very low temperatures, and 50% lower still, but the high boiling point of this grade makes it harder to start up on.

Good 90% benzole should have a specific gravity of .880-.883, and should be clear and colourless. There is no simple test which will give definite results, but the following will give a fair indication of quality. Take a 4 oz. stoppered bottle and measure into it one fluid ounce of sample and one fluid ounce of pure sulphuric acid, securely stopper the bottle and shake vigorously for one minute, and allow to stand for one minute. The heavy acid will separate out, leaving a clear, or slightly cloudy, colourless layer of benzole, the acid being a pale yellow or slightly darker colour. The benzole should not diminish in volume by more than about one-fifth of its original volume. The acid should not show brown or a darker colour within five minutes. Perhaps it would be interesting to compare results obtained in practice with theory in the comparison between petrol and good benzole.

Petrol is a distillation product of petroleum, and may be taken to be composed of approximately 84% carbon and 16% hydrogen, specific gravity, say, .720; while benzole contains 92.3% carbon and 7.7% hydrogen. When we buy a gallon of petrol we get 7.2 lbs. of spirit; when we buy benzole we get 8.8 lbs. of spirit—a clear gain of 1.6 lb. on every gallon, or about 18% more fuel. Also, the higher proportion of carbon to hydrogen in benzole shows us why we must give more air than with petrol—the excess of carbon would otherwise drop out of combustion in the form of soot or black smoke.

Benzole is a powerful solvent—much more so than petrol—and if enamelling is not protected by a hard lacquer, upon which benzole has no action, the enamel will soon be dissolved.

CHEMIST.

Hub and Counter-shaft Gears.

Sir,—I have been using during the present season a 4½ h.p. Calthorpe sidecar combination. This is fitted with their own counter-shaft gear, which drives with a chain to gear box, and then by belt to back wheel. This has not given me the slightest trouble during the whole season, and the chain and belt still appear as new. There are several similar machines around here, the owners of which all speak in loud praise of this drive. Some of these machines have been ridden between 4,000 and 5,000 miles, and the original chains and belts with which these are fitted still appear to be in first-class condition, neither do the riders complain of having any trouble at all with these gears.

E. BROWN, Hon. Sec. Burnley A.C.

Sir,—May I be allowed a little space to give my favourable opinion of a three-speed hub. I own a Triumph with Sturmey-Archer three-speed gear, which up to the present has done over 7,500 miles, solo and sidecar. The gears have given every satisfaction. They change well, are noiseless, and rarely require any adjustment. A little clutch slip was at one time noticeable, due to over thick oil. As regards wear on belts and tyres, I average 5,000 miles with a ⅞in. Dunlop. I am using one at present which has 5,500 to its credit. My back tyre, a Kempshall, has nearly run 4,500, replacing a lighter cover which did over 3,000. I have no interest in any of the makers concerned beyond that of a satisfied user.

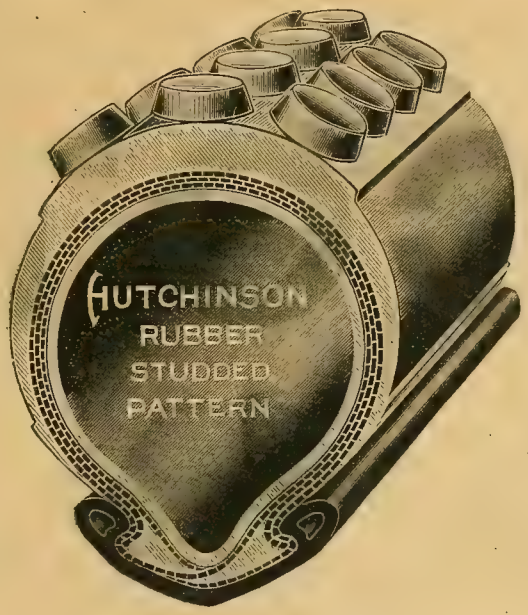
O. F. D. AIRTH, M.B., B.S.

Sir,—A season's riding of a 3½ h.p. single-cylinder with three-speed gear has not made me a hub gear enthusiast. My distrust of the three-speed hub arises not so much from my own misfortunes as from the experience of several of my friends and from the number I have seen *hors de combat* in garages and by the roadside.

I have only been hung up once; the teeth of the gear wheels had worn to such an extent that they refused to

HUTCHINSON

New Rubber Studded.



IN view of the tremendous success which our Rubber Studded patterns have achieved since their introduction on the market, we have decided to retain same for the coming season, with, however, several slight alterations and improvements.

In the new patterns the rubber studs have been placed somewhat closer together, as from experience we find that this arrangement gives considerably higher efficiency both as regards non-skidding and wearing qualities by reason of the fact that a larger number of studs are continually in contact with the road surface than is the case when studs are placed wide apart. As regards quality, the usual high standard of excellence characteristic of Hutchinson Tyres has been maintained, both in material and workmanship, and we have every confidence in recommending our new "Passenger," "Tourist Trophy," and "Brooklands" Rubber Studded grades as the last word in modern tyre construction.

Reduced Prices, now in force.

SPECIAL PRIZE FOR BEST SOLO PERFORMANCE.

— THE SCOTT ENGINEERING CO., LTD.,
SALTAIRE — SHIPLEY — YORKS.

In answering this advertisement it is desirable to mention "The Motor Cycle."

drive. Up to this time I had ridden 2,300 miles (1,000 with sidecar) and the gear had needed no adjustment.

It was found when fitting new gear wheels that the clutch plates were worn through; this seemed to point to the necessity of fitting larger bearing surfaces. The tip given by some of your correspondents how to make the gear last, *i.e.*, not to use the clutch much, rather amuses me. Why not build the device to do its duty under working conditions? Has the idea of fitting the clutch in the hub and the gear on a counter-shaft, or *vice versa*, been tried and with any success? This would seem to take some weight off the back wheel, simplify the construction of the gear, and minimise the danger of skidding. I agree with "Engineer" that the gear makers do not take much trouble to explain their wares. I should have taken my hub gear down long ago and studied its "innards" if I did not look upon it as a complicated device and need my machine daily.

I am looking forward to the development of the chain cum belt three-speed counter-shaft gear.

Re belts. Many of your correspondents complain of the poor service given by rubber belts. I ran over 3,000 miles last season with a ⅞in. Dunlop, and have done well over 3,000 this year with a belt of the same make and size, using a sidecar a good half of the distance; my only belt adjustment this season has been to cut an inch off in order to lower the gear. U 6652.

Sir,—Perhaps the following complete comparison and test, which, to my mind, is conclusive, may interest your readers. One November, my brother bought a 3½ h.p. machine with chain drive two-speed counter-shaft gear. Six months later I bought a "3½" two-speed belt drive hub gear, paying £2 more, both being in the neighbourhood of £60. Both machines have now completed 5,500 miles over almost identically the same roads (all long rides have been done in company, and we have only two roads to choose from for a distance of ten miles, one of which only is used, leading nearest station and market town). My machine is the faster, his has the lesser petrol consumption. Barring new fork links for each, due, I think, to our roads, neither of us has spent 5s. on repairs to front wheel, frame, or engine. I ought to mention that I live in the Lake District, with Hard Knott Pass, The Seat, Kiln Brow, Cold Fell, Crossdale, and other Six Days Trials hills within a radius of fifteen miles. Both bicycles are in splendid condition, in fact recently we climbed The Seat, Eskdale, from both sides with the greatest of ease *in the dark*, which some riders will appreciate. Both bicycles have had an identical testing with identical results, except with regard to the rear unit, viz., transmission gear and complete back wheel, a tabulated report on which is found below:

Counter-shaft Gear.	Hub Gear.
Transmission.—Chains, untouched.	*Transmission.* — Belts: 1 Continental (worn out), 1 Lyso (worn out), 1 Dunlop (done 1,100 miles).
Tyres.—1 anti-skid Kempshall (worn out), 1 heavy Kempshall (good condition).	*Tyres.*—1 Dunlop (worn out), 1 heavy Kempshall (worn out), 1 extra heavy Bates (good condition).
Gear Replacements.—Balls and small parts, value 6s. 3d.	*Gear Replacements.*—1 hub shell complete, 1 phosphor bronze clutch, 2 back axles, wheel rebuilt twice, 1 primary sun wheel, balls and small parts (value 27s.), add to which carriage of machine in breakdowns, for repairs, telegrams, etc., 37s.
Total running cost (approx. to 5s.), £5 6s. 3d.	Total running cost (approx. to 5s.), £20 9s.

L.A.

We must say that "L.A." has had a most unfortunate and unusual experience. We now possess our sixth machine with hub gear, and only two have given trouble. —Ed.]

The Modern Reliability Trial.

Sir,—Your timely remarks last week should induce club secretaries to consider more seriously what should be the object of a reliability trial. Personally, I gained the impression over a year ago that the freak hill trial was rapidly dying a natural death, but during the last few months it seems to have acquired renewed vitality, and the most recent examples have surely reached the limit of absurdity, since they one and all tend to show the public what 90% of good machines cannot do, instead of what the majority can do under reasonable touring conditions. I refer, of course, to trade supported events, and not to trials run for purely sporting purposes.

The committee of the Streatham and District Motor Cycle Club have for nine months past been carefully considering the tests to be imposed in their open trial which will be held on November 1st next, and they long ago came to the conclusion that tests of acceleration, speed, and ability to stop and restart on a steep gradient would be more sensible and of greater value, both to the public and the manufacturers, than the results obtained by including freak hills in the non-stop sections of a trial. Our trial, which is supported by the manufacturers, should, therefore, place in the hands of the public just before the Olympia Show a considerable amount of valuable data.

The reliability course, although not including freak hills or hairpin corners, is at the same time reasonably severe, while the machines which can pass the remaining tests and can also attain the standard speeds set for the lap of Brooklands will be hallmarked as being in every way first-class touring mounts. We have also, for the first time, included a class for 300 c.c. machines, which should enable the performances of the smaller solo mounts to be judged more correctly by comparison with those in the 350 c.c. class.

FRANK L. BASSETT,
Hon. Secretary Streatham and District M.C.C.

Off for a Morning Dip.

Sir,—I beg to enclose photograph of two friends and myself, members of the Broomfield Park Swimming Club, on our way to Highgate Pond for a morning dip. You will notice the machine is a 6 h.p. Royal Enfield, and it may be of interest to readers to know that, although I have ridden 3,500 miles on the tyres provided with motor when new (Dunlops), the driving tyre appears to be good for another 2,000 miles. I have had one puncture in each tyre, and that was when holiday-making in a flinty part of Suffolk.

C. B. PETERS.

A 6 h.p. Enfield sidecar owned by C. B. Peters. (See letter.)

An Undesirable Practice.

Sir,—Being a constant reader of your journal, may I express an opinion on carrier riding? I maintain that if the passenger be a male and uses pedals or footrests it is quite a safe way of riding, but I do not think that it is wise for "flappers" to try on account of their dress, and they cannot put their feet on the pedals. My brother and I have covered a good many miles in this way, myself riding on the carrier, and I do not think my brother suffers from the "headstrong rashness of youth."

The carriers on most motor cycles are very strongly made, as the makers know that they will be used for this purpose. Your correspondent has most probably never ridden like this, and so he ought to try it before protesting against it.

W. A. COE.

A Problem.

Sir,—We have read with interest Mr. Bailey's letter in your last issue, and there are one or two points with which we cannot entirely agree. In the first place, he says the engine which he examined was timed "theoretically" right, and we presume that he means this was the makers' timing. What we cannot understand is how the makers, who have undoubtedly subjected their engine to exhaustive bench, track, and road tests, could have overlooked the slight adjustment which, as Mr. Bailey says, would result in an increase in speed of twenty miles per hour and a corresponding increase of hill-climbing powers. What we would like would be a more definite description of the changes in timing Mr. Bailey effected. In conclusion we may state that we believe with "Ixion" that, in the majority of cases like "Twin Jap's" the data provided are insufficient to enable a diagnosis to be made off-hand.

WM. BRIGGS.
D. MACDOUGALL.
G. C. WALKER.

The A.C.U. Cycle Car Trial.

Sir,—The A.C.U. has arranged an interesting trial, and one which apparently should be well within the powers of the modern cycle car. Personally, I regret that a puncture can end the chances of a promising machine, for in by-roads even the best of tyres may succumb. Against such ill-luck the only remedy is to enter more than one car. A noticeable provision is that unless twenty-five cars are entered there will be no trial. This is perfectly fair. In the Spring Trial there were sixteen cycle car entries, representing, however, only six makers. This is not a hopeful augury. But exception was then taken to some of the rules, and perhaps this may have caused some to hold aloof. There are now 150 cycle cars on the market, and as several of each of the more popular types will be entered it will need hardly more than 10% of this number to complete the entry. Twenty-four firms are exhibiting cycle cars at Olympia. It is not unfair to say that any of these which have shirked the trial (unless they have already submitted to the ordeal of a competition test) will be self-condemned. Certainly the list of entries should be published, even if the trial is not run. Of course, any reasonable excuse for absence should be noted, though in this case perhaps *qui s'excuse s'accuse*. I wish the A.C.U. could have adopted *The Motor Cycle's* suggestion to include a spin at Brooklands. I notice that the Streatham Club, in their very sporting trial on November 1st, have done so.

H. GEORGE MORGAN.

Prices of Motor Cycles.

Sir,—Replying to Mr. Gordon C. Francis, in your issue of October 9th, I, as an old rider, and consequently a buyer of motor bicycles, am naturally anxious to purchase my mount as cheaply as possible. At the same time I am not quite so inclined to eulogise Messrs. Humber, Ltd., for reducing motor bicycles by £5.

Old expert riders and racing men are fully alive to what has happened to the push bicycle through the reduction of prices, and, as experts, they can see that many eminent firms, in reducing their prices, have designed the machines solely with an eye to cheapening manufacture, and that such machines cannot be compared with the carefully constructed machines made by some of our old firms some ten or fifteen years ago.

In fact, some of the machines which are now turned out run very "dead," and "running between the strokes" (to use an oarsman's phrase) seems, in many makes, to have entirely disappeared.

As an enthusiastic motor cyclist I would prefer to see manufacturers trying to improve details, adding refinements, and studying efficiency, rather than adopting a policy of reducing prices by a few pounds, for not only is it impossible to make improvements if prices are cut, but firms will find it necessary to design their machines with an eye to reducing the cost of production—that is, of course, if any return is to be made to their shareholders.

UTILITAS.

How to Test Benzole.

Sir,—I cannot allow the criticisms of my contribution to pass unchallenged. To begin with "Technical Chemist." It is not absolutely necessary to use a water-cooled condenser for a liquid which boils about 100° C. If the liquid is distilled in drops the air will cool sufficiently well, without the additional expense of a water condenser. If any tendency be shown on the part of the benzole to escape a piece of filter paper or blotting paper moistened with water and wrapped round it will keep it sufficiently cool. I have done and have seen this done numberless times. He goes on to say that "many novices will, in all probability, use a gas ring, or something equally unsuitable, and begin to distil at such a rate that practically no condensation would take place, and the vapours would ignite." True enough; but in my article I did not mention a "gas ring or something equally unsuitable," but a "bunsen burner or a spirit lamp" to heat it, "so that it comes over in drops and not in a continuous stream." If, after that, anyone does the test by putting the retort in a furnace and complains of explosions and burns, I wash my hands of the affair. It may interest "Technical Chemist" to know that in a certain works boys of fourteen, fresh to the business, are put on to this test in a very short time, and get results as accurate as are required; it, therefore, does not require an expert manipulator; the test is too simple.

"Chemist" takes exception to my statement that there is no quick and accurate method for the estimation of sulphur in benzole, and then says that the method I give is the only way to determine the total sulphur. His account of the method of estimating thiophene is quite correct, but he is not correct in saying that carbon bisulphide "can be quickly and easily estimated with accuracy with the aid of a good balance"! It happened that, only a few months ago, several business friends and myself had occasion to want a method of estimating carbon bisulphide quickly, and we collected all the known literature, and investigated all methods given, together with some new ones of our own. The conclusion we came to was that the only satisfactory method was the stock method of forming the xanthate with alcoholic potash. We could not get concordant results with any other method. I mention this to show that my statement is not made idly. The phenylhydrazine test is purely a *qualitative* one and not a quantitative. If "Chemist" is going to judge by the precipitate formed and floating in a liquid, how much carbon he had to begin with, he does well to hide his name. Nearly all benzoles contain carbon bisulphide, but very few people would estimate the impurity any other way than by the xanthate test. Finally, there are other sulphide compounds in benzene than carbon bisulphide and thiophene.

I beg leave to adhere to my statement that "there is no quick, easy, and accurate way of testing for sulphur."

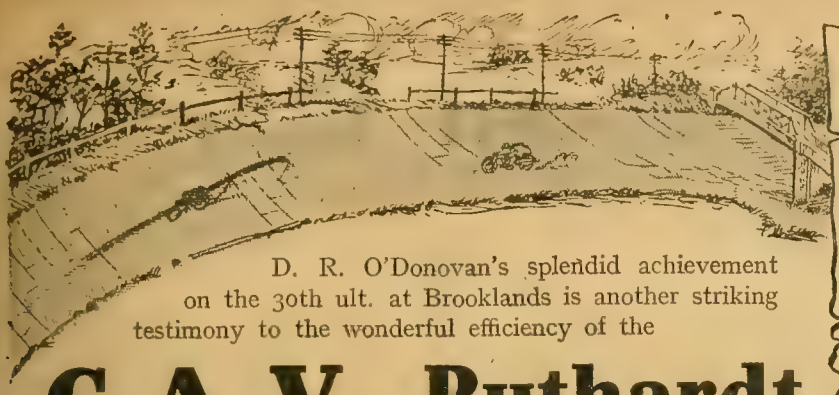
F. E. THOMAS.

SUMMARY OF CORRESPONDENCE.

LEVEL CROSSINGS.—"A Railway Signalman" writes, with reference to the complaints of Mr. G. B. Williams, that the gates have no right to be closed against the public while the signals are at danger, and that Mr. Williams's proper course would have been to report the signalman in question to the superintendent. [We should advise all readers who experience similar treatment to adopt this plan.—ED.]

NOTICE TO CORRESPONDENTS.

As we regularly receive many more letters than we are able to publish, we urge our readers to be concise and to the point. Also our correspondents are requested to note that we do not acknowledge by post letters intended for publication unless a stamped addressed envelope is enclosed. If, therefore, any letter does not appear in our pages, the writer must conclude either that it is unsuitable or that we have not space to print it.—ED.



D. R. O'Donovan's splendid achievement on the 30th ult. at Brooklands is another striking testimony to the wonderful efficiency of the

C.A.V.-Ruthardt Magneto.

Racing men, tourists, and club men know that there is not a more reliable means of ignition than the Ruthardt Magneto under all conditions of riding and in all weathers. It gives a lively spark, and is proof against dirt, damp, and water. This is the magneto you should use. It is the first self-contained type, and will not fail to give you satisfaction. **Post us a Card for Catalogue.**

DOUGLAS BROS., Kingswood, BRISTOL.

LONDON: 39, Newman Street, W. **PARIS: 190, Boulevard Pereire.**

In answering this advertisement it is desirable to mention "The Motor Cycle."

Coventry Club's Annual Hill-climb.

Seven Events run off in Two Hours. Rain Causes Discomfort.

Douglas M. Brown (3½ h.p. Rover) starting in Class 4.

JUST as spectators began to arrive at the Coventry and Warwickshire Motor Club's hill climb it was all over, for, thanks to an early start and excellent organisation, there was no waiting between the classes, and exactly two hours sufficed to finish the competition. And it was fortunate that a start was arranged at mid-day, for, about one o'clock, the rain which had threatened on and off all the morning developed into a settled downpour, and by two o'clock the road surface was decidedly slippery. Had a later start been fixed upon the event would have suffered the same fate as the Brooklands championships.

The weighing and inspection of the competing machines were effected under cover in the spacious yard of the Red Lion Hotel, Banbury, whither all competitors were asked to congregate. Here a notice was posted giving directions to the hill, which proved to be Swerford Heath, on a by-road abutting on to the main Banbury-Chipping Norton Road. It was a well-kept secret, and the hill was generally agreed to be a highly suitable one for a competition, measuring half a mile in length, and the sweep to the left being so gradual that it could be taken at full speed. The surface in the middle portion was rather lumpy, but its composition was so soft and crumbly that, but for a few wobbles, no one was hindered. It is curious that the small section who seemed rather afraid of the surface came off best in the results.

An Unfortunate Clash of Dates.

The entry numbered nearly 150, including many well-known riders, but the combined B.M.C.R.C. and A.C.U. event at Brooklands undoubtedly affected the entries considerably, and to say that the Coventry Club Committee are not pleased at the A.C.U.'s action in refusing a permit for the original date the Coventry Club selected at the last Olympia Show, viz., September 6th, is only putting the matter mildly. It was the A.C.U. who allotted October 11th to the Coventry Club, and so caused the unfortunate clash, which should clear the Coventry Club of any blame in the matter. We suggest that the matter should be enquired into further, for the Coventry hill-climb has become one of the principal events of the year, and Saturday's event was the eighth consecutive event of the kind, and the first time (and last it is hoped) that it has been held so late in the year.

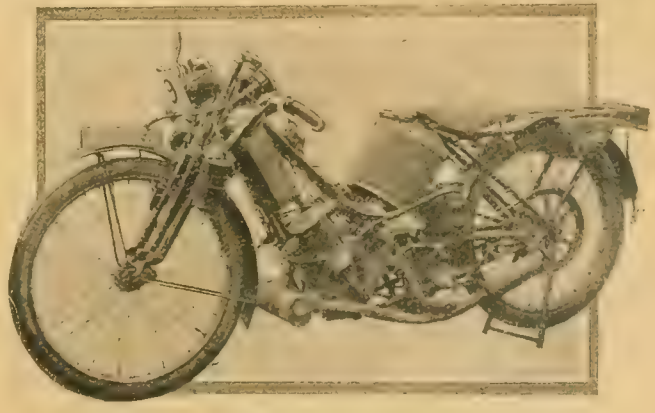
Class I. for lightweights up to 350 c.c. was expert barred, which told its tale on the entries for only three names appeared—a Connaught, Premier, and Hobart. Cocks's two-stroke was rather slow in getting away. The little Premier was very fast, and was first on time and formula, which place, however, it had to give way to Dudley's Hobart, as it had no pedalling gear, and 1¾in. tyres instead of 2in. tyres according to catalogue. The results of this class are appended:

CLASS I.

Time.	Secs.	*Formula.*	Fig. of merit.
*J. Viner (2½ Premier)	50	*J. Viner (2½ Premier)	228
J. Dudley (2½ Hobart)	52⅘	J. Dudley (2½ Hobart)	241
A. Cocks (2½ Connaught)	61⅘	A. Cocks (2½ Connaught)	372

* Disqualified.

In Class II. for standard touring machines up to 500 c.c. (expert barred) the judges were faced with an array of T.T. roadster machines and a full T.T. mount. However, the winner of the fastest time prize turned up in H. Green on a Triumph, who made a fine climb, whilst the formula award went to G. G. Barnard's 3½ h.p. Singer. Simpson's Rudge accelerated in fine style. Gorton (Rover) seemed to change gear too soon, whilst Davies (Rover), on a touring three-speeder, showed up conspicuously. Gordon Francis used the



One of the T.T. Scotts at the Coventry hill-climb. Observe the method of fixing the handlebars to the base of the steering head.

Coventry Club's Annual Hill-climb.

low gear of his Lea-Francis to good advantage at the start, and his pace was not perceptibly slower than the 499 c.c. riders. He took 43⅕s. The official times and results are:

CLASS II.

Time.		*Formula.*	
	Secs.		Fig. of merit.
H. Green (3½ Triumph)	37⅖	G. Barnard (3½ Singer)	192
D. M. Brown (3½ Rover)	39⅖	G. Francis (Lea-Francis)	196
G. Barnard (3½ Singer)	39⅗	H. Green (Triumph)	219
E. Lovegrove (3½ Ixion)	40	W. L. Davies (Rover)	225
W. J. Davies (3½ Rover)	40⅖	D. M. Brown (Rover)	226
V. Harrison (3½ Triumph)	40⅘	J. Woodhouse (Quadrant)	226

The stopping and starting test for standard touring variably geared machines was a most interesting event, though Francis was an absentee, due, it was learned subsequently, to a broken valve on the loop road to the starting line. He had no spare. This year the riders stood five

J. H. Pountney (3½ h.p. Rover) making a good restart in the stopping and starting class which he won.

seconds between the lines. Burney (Blackburn) restarted very neatly, but Pountney (Rover) was much faster (Rover three-speed machines always show up well in these tests, partly due to a sensibly designed toe and heel clutch pedal. Gorton (Rover) was too flurried to give a good account of himself. Dudley's 2½ Hobart dashed between the lines, and seemed a certain formula winner, but on receiving the signal to restart he let in his clutch pedal too suddenly, and the front wheel twice rose in the air like a bucking broncho buster, and finally tried to climb a pole supporting a rope to keep the spectators back. Lucas (Triumph) stopped and started very well, but Davies (Rover) overshot the second line and stopped his engine. He caused a laugh by pretending to misunderstand the official's instructions to continue up the hill, by returning to the starting point and successfully persuading the starter that he was to be allowed another attempt. His ruse worked well, and if he had not made his first mistake he would have been a prize winner.

CLASS III.

Time.		*Formula.*	
	Secs.		Fig. of merit.
J. Pountney (3½ Rover)	56	J. Pountney (3½ Rover)	396
R. Lucas (3½ Triumph)	59⅘	R. Lucas (3½ Triumph)	500
B. S. Gorton (3½ Rover)	68⅘	B. S. Gorton (3½ Rover)	630
C. S. Burney (3½ Blackburn)	72⅘	C. S. Burney (3½ Blackburn)	658

Speeds went up in the T.T. Class, which was splendidly supported, De la Hay (Sunbeam) leading off the ball at a tremendous pace for a 2¾ h.p. in the absence of Haswell, who was at Brooklands watching the rain come down. Gilbert Hall followed on a 3½ h.p. Scale-Jap, and the rider struck us as among the very fastest, never cutting out and bounding up the hill at express speed. By the way, Hall brought his machine from Derbyshire mounted on a special sidecar framework built to accommodate it attached to a 7 h.p. Indian. Triumphs were very popular in this event, Crawley, Green, and Cheshire, all stable companions, anxious to outdo one another. Young Crawley succeeded, and, incidentally, set up the fastest time of the day in a superb ascent averaging 50.56 m.p.h. His mount scaled 170 lbs. Clark's Ivy-Precision was not in its best fettle. Dudley's racing engine went wrong, so he used his touring mount. D. M. Brown (Rover) travelled at a fine bat. Busby, the heavyweight, on a lightweight Sunbeam, has certainly done better, but his weight enabled him to score on formula. Woodhouse, this time on a Quadrant, came up well, likewise Horsman and Dixon on their Singers. All eyes were now turned to the two racing Scotts, H. O. Wood (the T.T. winner) and A. A. Scott (the designer) up. The last named broke a chain on the starting line and made his climb after effecting a repair; Wood was not so speedy as it was expected he would be, though his riding position seemed ideal. The handle-bars were attached in an unusual position at the bottom of the steering head. Whitworth's Douglas was fast, yet hampered by misfiring.

CLASS IV.

Time.		*Formula.*	
	Secs.		Fig. of merit.
S. Crawley (3½ Triumph)	35⅗	T. C. de la Hay (2¾ Sunbeam)	161
Gilbert Hall (3½ Scale-Jap)	35⅘	V. Busby (2¾ Sunbeam)	171
C. Newsome (3½ Rover)	36⅖	H. G. Hill (2¾ Calcott)	183
H. Green (3½ Triumph)	37⅖	Gilbert Hall (3½ Scale-Jap)	197
T. C. de la Hay (2¾ Sunbeam)	37⅗	S. Crawley (3½ Triumph)	209
V. Harrison (2¾ Sunbeam)	38⅘	F. S. Whitworth (2¾ Douglas)	211
V. Horsman (3½ Singer)	39⅘	D. M. Brown (3½ Rover)	213
D. M. Brown (3½ Rover)	40	A. J. Dixon (3½ Singer)	216
P. Symonds (3½ Rudge)	40	H. Green (3½ Triumph)	219

First "general" rider on time and formula: Gilbert Hall.

The Effects of the Rain.

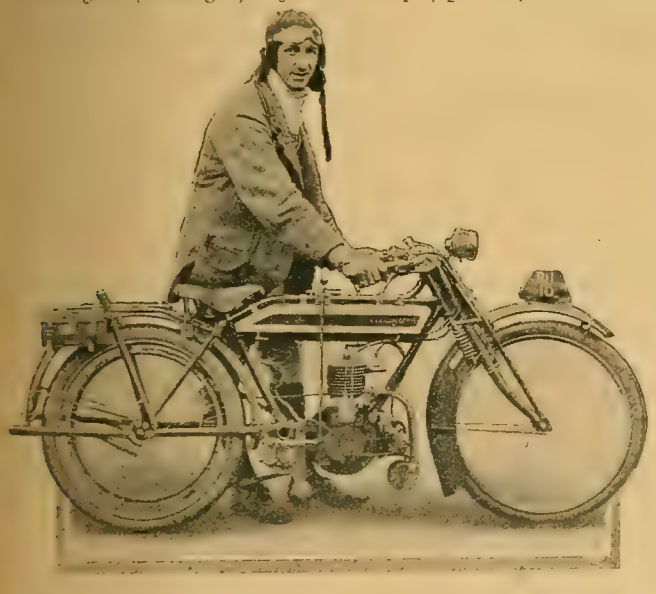
The belt-driven sidecars in the passenger class were considerably handicapped by the wet, and Griffith (8 h.p. Zenith) and S. Briggs (8 h.p. Campion-Jap), who occupied first and scond places, would have been seconds faster but for belt slipping. H. F. S. Morgan had entered his 8 h.p. Grand Prix runabout, and, unfortunately, cannoned a bank

Coventry Club's Annual Hill-climb.—

at high speed on his way to the hill, buckling a wheel and otherwise damaging the vehicle. A private owner with a similar machine happened to be among the spectators and offered his vehicle, which Morgan accepted, and though a good ascent was made, the speed was not fast enough to win. Misfortune overtook the other Morgan entered, for McMinnies, who had for some reason entered his single-seater in the passenger class, petered out on the steepest portion for reasons he could not tell us. He had a similar experience at Weston the Saturday previous. West's 8 h.p. Bat came over the brow of the hill very well, but was slow in getting up speed. The veteran Tom Silver's chain-driven Quadrant seemed to be the fastest 3½ h.p. mount, and scored a well deserved success on formula. Brown (6 h.p. Rex) was single-geared, but he sped up the hill at a fine pace. Lucas had a tiny sidecar on his Triumph pointed front and rear, and his passenger was so tight a fit, that it was suggested that a shoe horn would be necessary to extricate him.

CLASS V.

Time.	Secs.	*Formula.*	Fig. of merit.
G. Griffith (8 Zenith)	48⅖	T. Silver (3½ Quadrant)	285
S. Briggs (8 Campion-Jap)	49⅗	V. Horsman (3½ Singer)	287
G. H. Brown (6 Rex)	52⅕	C. Newsome (3½ Rover)	306
T. V. West (8 Bat-Jap)	54⅘	H. Morgan (8 Morgan)	332
T. Silver (3½ Quadrant)	56⅗	S. Briggs (8 Campion-Jap)	342
H. Morgan (8 Morgan)	57⅖	L. Newey (3½ Ariel) ...	380



The latest model 2½ h.p. two-speed two-stroke Connaught ridden by A. G. Cocks.

Owing to the wet state of the roads, by the time Class VI. was run off high speeds were impossible, and the plucky riders had some difficulty in seeing their way owing to the blinding rain. Most of those in the T.T. class were also in this event. Greatwich on a 5 h.p. Wright-Blumfield, who has now several successes to his credit, made a wonderful climb, charging through the grease and rain in fearless style. He is a "general," and beat all the experts. He was able to beat Griffith on the big Zenith, though only by ⅘s. Busby improved considerably, beating de la Hay this time. Clark's water-cooled Green was tuned up to perfection. Brown's twin Rex, which was the forerunner of the 1914 model with enclosed valves, was swift and silent, and Crawley this time toured up, his engine racing every time he opened the throttle. J. J. Cookson (8 Matchless) was not able to do himself justice in the wet. The Scotts did well again, though slow at picking up, but C. T. Newsome (Rover) was obviously among the fastest. Waring's appearance on a mudguardless W.D., likewise Lamb on a stripped Premier, can best be imagined. Result:

CLASS VI.

Time.	Secs.	*Formula.*	Fig. of merit.
H. J. L. Greatwich (5 Wright-Blumfield)	38	V. Busby (2¾ Sunbeam)	186
*G. Griffith (8 Zenith)	38⅘	T. C. de la Hay (2¾ Sunbeam)	187
J. Cookson (8 Matchless)	39	H. G. Hill (2¾ Calcott)	197
C. Newsome (3½ Rover)	39	F. S. Whitworth (2¾ Douglas)	198
E. Cheshire (3½ Triumph)	39⅕	*K. H. Clarke (2¾ Green-Precision)	225
F. Lamb (3½ Premier)	39⅖	J. Woodhouse (3½ Quadrant)	259

* First expert. * First general.

The Team Awards.

The team prize was carried off by the trio representing the organising club, the riders and their performances being

	Fig. of merit.
G. I. Francis (Lea-Francis)	196
C. T. Newsome (Rover)	204
J. Dudley (Hobart)	241
	641

The Triumph team was second and the Scott third.

A car class wound up a highly successful programme, Morris-Oxford light cars being first and second on the handicap.

The competitors appreciated the promptitude with which the event was run off.

The time results were announced by 4.30 p.m. on Saturday and the complete results next day.

Mr. J. F. Spencer was the trials hon. sec. for this event, and Messrs. Roebuck and Milligan calculated the results on *The Motor Cycle* formula.

LARGE ENGINES versus SMALL.

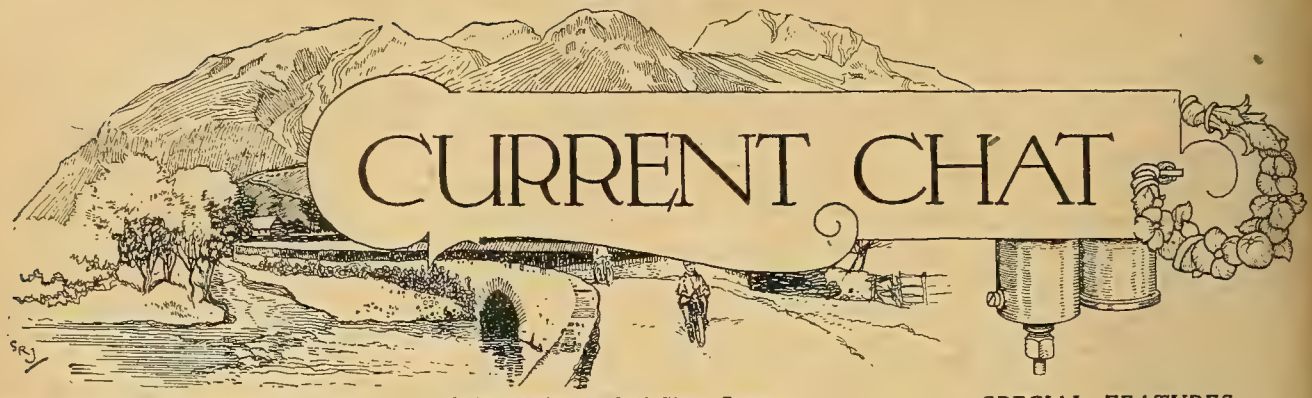
THESE last few months have seen a succession of races where the 350 c.c. twins have come very near to equalling, or even beating, the 500 c.c. singles.

First of all the T.T., where the terrific speed of Mason's N.U.T. and some of the Douglas contingent was the topic of the day. Next the Grand Prix, where, for some time, it looked as if Fenton's Clément might beat the 500 c.c. class. Again, the recent Six Hours Race at Brooklands, where a wholesale smashing of records took place. Here again it was Mason's N.U.T., and granted that both machine and rider are exceptional, yet this can be said with equal truth of at least 25% of the entries. Not only on the track has this been apparent, but many single-cylinder enthusiasts will have to own to taking the dust of, say, a T.T. Douglas this season. Lastly, as recently as last Saturday, de la Hay's 2¾ Sunbeam was only two seconds slower than Crawley (Triumph), who made fastest time of the day, beating all the big twins.

Of course the secret of this is "revs.," the small twins running at, say, 4,000 r.p.m., giving off nearly the same power as the large "one-lunger" at 3,000 r.p.m. In fact it is the old discussion, "high-revving" small engine or "slow-revving" large engine. As the high speed engine is lighter, frame design, etc., is lighter, and we have a lighter and more economical mount, and, in these days of high-priced petrol, mileage per gallon is an important factor.

Unfortunately for himself the average motor cyclist scans the accounts of races from the sporting point of view and then throws his paper aside. The engineer and designer would like to know much more, but the information is hard to arrive at. For example, what would some of us not give to know the gear ratios, weight of machine and man, maximum speed, petrol consumption, and condition of bearings, valves, etc., of Mason's N.U.T., and, say, Haswell's Triumph, after the Six Hours Race. Such private secrets as piston clearances, strength of valve springs, etc., we do not ask, although, should they be given, so much the better. Surely this is not too much to ask, and the choice of one's next year's mount would be an infinitely easier task.

NORSEMAN.



TIME TO LIGHT LAMPS.

Oct.	16th	... ...	6.4 p.m.
,,	18th	... ...	6.0 ,,
,,	20th	... ...	5.56 ,,
,,	22nd	... ...	5.52 ,,

A Motor Cyclist's Promotion.

We congratulate Rear-Admiral Sir R. K. Arbuthnot, Bart., on hoisting his flag with the Second Battle Squadron.

A Gradient of 1 in 2.44.

Continuing his search for steep hills to climb, W. H. Carson last week made a successful ascent of Vale Street, Bristol, on his Excelsior big single and sidecar. The total load was 6 cwt. 2 qrs. 12 lbs.

Caution required in Ross.

The Urban District Council of Ross, realising that the town is a dangerous one, instead of seeking to impose an enforced speed limit, have decided to write to the various motoring associations asking them to request their members, through the Press, to drive slowly through Ross, owing to the many dangerous corners in the town. The proposer, Mr. Hall, wisely thought that such steps would have greater effect than speed limit notices.

Police and Number Plates.

Motor cyclists in the Derby district will be well advised to see that their rear number plates are kept clean, as recently the police have shown some activity in proceeding against riders with partially obscured plates, and also for allowing the clothing of a passenger on the carrier to hide the rear number.

The B.M.C.R.C. and A.C.U. Championship Meeting at Brooklands.

The programme for the B.M.C.R.C. meeting postponed till next Saturday owing to incessant rain is an extremely busy one. Before lunch there will be the Third 1913 Time Trials, followed by the One Hour Cycle Car Race and the One Hour Sidecar Race. In the afternoon there will be held the Junior One Hour A.C.U. Championship Race for machines up to 350 c.c. for the Auto Challenge Cup and A.C.U. gold medal. Event V. will be the A.C.U. Championship Race for machines up to 1,000 c.c. for *The Motor Car Journal* Challenge Cup, and the Senior One Hour Championship Race for machines up to 500 c.c. for *The Motor Cycle* Challenge Cup. These three Challenge Cups were presented to the R.A.C. before the founding of the A.C.U. in 1900.

"The Motor Cycle" Show Issues.

Three special issues of this journal will be published in connection with the Olympia Show. The first on Thursday, November 13th, will deal with passenger machines of all types. The issue of the 20th November will be a guide to the Show, and will contain the complete Buyers' Guide of 1914 models—an appreciated feature of *The Motor Cycle* since 1906. The issue following will contain a complete Show report by our own staff after a stand to stand inspection of the exhibits.

FUTURE EVENTS.

Nov. 1.—Streatham and District M.C.C. Open One Day Trial.
,, 7-15.—Motor Car Show at Olympia.
,, 24-29.—MOTOR CYCLE & CYCLE CAR SHOW AT OLYMPIA

Motor Cycle Imports in 1913.

For the nine months ending 30th September, 1913, the imports of motor cycles into the United Kingdom totalled 1,396, of a total value of £47,553. This is a very considerable increase on the corresponding period of 1912, when the number of imported machines was 1,086, valued at £35,099. It is pleasing to note that our export trade has vastly increased this year as compared with last year, the number of complete motor cycles sent abroad up to 30th September being 12,724, against 8,789 in 1912, the respective values being £548,552, against £352,668.

Sleeve Valve Motor Cycle Engines.

The makers of the Argyll single sleeve valve engines, which have been so conspicuously successful on road and track, are now, we understand, experimenting with an air-cooled motor cycle engine on the same principle, and we hear that, although still in the experimental stage, the results obtained have been so encouraging as to warrant a hope that this interesting engine will at no very distant date be on the market and available for use by motor cyclists interested in this type of engine. We hope to be able to give further particulars in due course.

SPECIAL FEATURES:

WHAT THE SHOW WILL REVEAL.

AN ORIGINAL TWO-STROKE CYCLE CAR.

ON MANŒUVRES.

Next Year's Improvements.

An article in this issue outlines in brief the improvements to be expected in 1914 pattern motor cycles. The information being based upon advance details of new models which have reached us names have had to be omitted.

A Motor Cyclist Aviator.

We hear from Mr. Ivan Hart-Davies, whose runs between John-o'-Groat's and Land's End have made him famous as a motor cyclist, that he has just taken his aviator's certificate at the Hendon Flying School. Shall we now hear of an End-to-end record on a aeroplane?

A Humber 6 h.p. Machine.

Another 6 h.p. twin-cylinder sidecar machine which will make its appearance at the Show is the new Humber. This new mount will have chain transmission, and probably a three-speed gear.

Result of a Criticism.

The mile irons on the Fosseway, which we criticised some time ago in dealing with this fine new stretch of road between Leicester and its junction with the main Nottingham-Grantham Road, have now been taken up and set so as to be readable.

A Stolen Machine.

8 h.p. Zenith and sidecar. Sidecar upholstered in red, D.A. gas cylinder on sidecar frame, new Continental tyre on back. Engine No. 16,283. The owner, Mr. E. B. Loach, 21, St. John's Park, Upper Holloway, is offering a handsome reward for the recovery of this machine.

Paris Motor Show

The South-Eastern and Chatham Railway announce the issue, on Fridays the 17th and 24th, and Saturdays the 18th and 25th October, of fifteen-day excursion tickets from London to Paris in connection with the International Automobile Exhibition which will be held in Paris from October 17th to the 25th inclusive. The price of these tickets will be: First-class, 58s.; second-class, 37s. 6d.; third-class, 30s.; by the 10 a.m. service *viâ* Boulogne and the 9 p.m. service *viâ* Calais, from Charing Cross. The 12.30 midnight service is available for the return journey.

British Victory in Italy.

A notable Zenith success is reported from Italy. J. E. Scales, who is the owner of the 8 h.p. Zenith on which G. F. Hunter set up the flying kilometre record at over 70 m.p.h., has won a race of 320 kilometres, the course including two ascents of the Col di Sestrières, which has an altitude of 6,200 feet.

Motor Cycles at the Paris Salon.

It would appear that French motor cycle manufacturers have made very little alteration to their standard mounts for 1914, judging from advance details which have reached us of motor cycle exhibits at the Paris Salon. A number of firms are adopting English fittings throughout, and hub three-speed gears are now being standardised.

The Show opens to-morrow (Friday), and will remain open until Oct. 27th.

British Victories in Spain.

The hill-climb held at Monte Iguldo, San Sebastian, proved a walk over for English machines, more especially for the Douglas, which figured prominently in every class. The results are as follows:

CLASS I. (350 c.c.).

	m.	s.
Arana (Douglas)	3	7
Sorriguieta (Nut-Jap) ...	3	14
Arellano (Douglas) ...	3	15
Badia (Douglas)	3	25

CLASS II. (500 c.c.).

Arana (Douglas)	3	10
Badia (Bat)	3	11
Arellano (Douglas) ...	3	12
Sorriguieta (Nut-Jap) ...	3	13

CLASS III. (1,000 c.c.).

E. Lauda (Indian) ...	2	56
Arana (Douglas)	3	4
Lauda (Indian)	3	10

Open Trial in November.

An interesting and novel trial will be held by the Streatham and District M.C.C., starting at 8 a.m. from the Clayton Arms, Godstone, on Saturday, November 1st. At the start an acceleration test will be held, which will be followed by a non-stop reliability test. There will be five classes for motor bicycles, ranging from 300 to 1,000 c.c.; three sidecar classes ranging from 500 to 1,000 c.c.; and two classes for cycle cars, three-wheel and four-wheel. The average speed of a competitor during the fifty yards of the acceleration test will be the basis of calculation for deciding the figure of merit. The competitor whose average speed is highest in each class will be taken as having set the standard of performance in that class. The competitor whose average speed is within 5 m.p.h. of the best average speed in his class will be held to have qualified in the acceleration test. Seventy miles will be covered before lunch, and thirty miles after lunch, which will be served at Brooklands. There will be a speed test, consisting of one lap round the track. Competitors will enter by the Byfleet gate, and must immediately turn right and commence their speed lap. Various set speeds have been settled upon for the various classes. After the speed test there will be a stop for lunch of one and a half hours. In the course of the afternoon there will be a re-starting test.

A Midland Road Improvement.

Returning from the Coventry hill climb we were pleased to note that at Ladbroke the dangerous right-angle corner had been removed and the road widened, and on the gatepost facing the Banbury Road a red reflex light has been fitted.

The Cycle and Motor Trades' Benevolent Fund Banquet.

The eighth annual banquet of the Cycle and Motor Trades' Benevolent Fund was held at the Connaught Rooms, Great Queen Street, Kingsway, on Thursday, October 9th. Mr. S. F. Edge took the chair, and a most *recherché* dinner was provided. A speech was made by the chairman, and Mr. A. J. Wilson replied. Mr. Charles Jarrott proposed the health of "The Chairman." There was a record attendance, and the sum collected by subscription during the dinner totalled an amount of £3,009 10s. An excellent musical programme proved a great success, many leading performers in the musical world singing and reciting. The dinner was a huge success, and was attended by most of the leading lights of the motor cycle world.

Saturday's Downpour at Brooklands.

The weather unfortunately marred what promised to be a very successful day's racing at Brooklands last Saturday.

We found a few riders taking shelter in the Paddock. Le Vack (3½ h.p. Motosacoche and sidecar) was bewailing the fact that he only had half a mudguard for three wheels!

We noted a machine with a twin J.A.P. engine and a wonderful freak sidecar, or rather, half a one. It consisted of a chassis and a seat to sit in, or rather lie on, with a piece of wood in front to accommodate the passenger's feet. In style it was similar to the "Earwig" model fitted to E. B. Ware's Zenith. We also recognised Baragwanath's big Matchless. The rider of an Eagle machine had broken his piston in practice and was amusing himself by sitting in a puddle removing the cylinder.

Later we saw S. Tessier on a 4 h.p. water-cooled overhead-valved Bat-J.A.P. and sidecar. The machine, fitted with a neat radiator, looked very attractive.

Many competitors had travelled a long distance to take part, Healy, for instance, having brought his Rudge from Dublin. The event is to be held next Saturday.

The Trial for Cycle Cars.

Entries for the A.C.U. trial for cycle cars close on Saturday next. The event will not be held unless twenty-five entries are received, and at the time of going to press it seemed doubtful whether the required number would be reached.

Gear Ratios in Speed Trials.

A regulation has been added that, in the flexibility speed trials, which will take place in Brookman's Park on the 25th inst. (see page 1291, October 2nd), the gear ratios in Classes I. and II., Divisions A, B, and C, must not be lower than 6 to 1.

The Triumph Balance Sheet.

The report of the directors of the Triumph Cycle Co. is most satisfactory. The profits on the season's trading after deductions for repairs and other items amount to £68,099 16s. 1d. A dividend of 6½% is to be paid on preference shares, and 20% (plus a bonus of 2s. per share, which equals another 10%) free of income tax upon ordinary shares.

Sequel to Rowdy Behaviour.

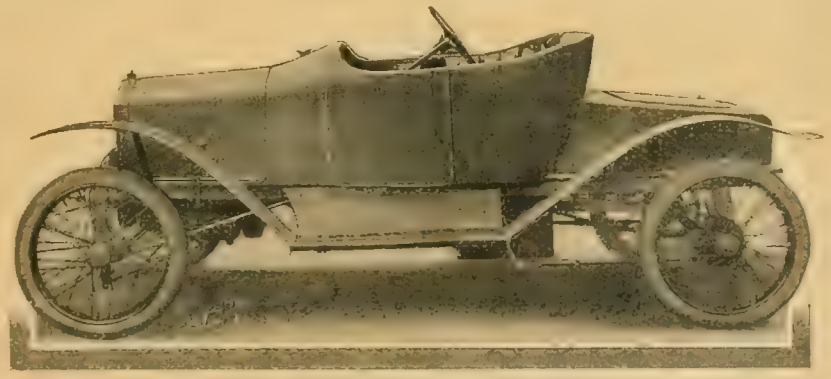
In connection with the rowdy behaviour on the occasion of the Anglo-Dutch Trial, reported at Oxford and Coventry, three prominent riders have been suspended by the A.C.U., one for six months, and two for three months, dating from October 7th, the date of the General Committee meeting.

The Enfield Balance Sheet.

The Enfield Cycle Co. have had a most successful year, the gross profits amounting to £34,684 8s. 9d. Part of this goes to necessary repairs of building, plant, etc., and large sums transferred to the reserve fund, and carried forward to the credit of next year's account. A dividend of 14% is to be paid on preference shares and 10% on ordinary shares.

The Effect of Benzole on Tanks.

There are some indefinite rumours going about that the continued use of benzole has a deleterious effect upon the tank of car or motor cycle. We have used benzole now for several months, and have noticed no such effect. We should be glad, therefore, to have first hand information on this subject from any reader who has actually experienced anything of the sort.



£78 OR £100?

The complete Ajax four-wheeler, a full description of which appeared on page 1322 of "The Motor Cycle" last week. The engine is four-cylinder, and friction drive is used. It has been stated that this French cycle car will sell for £78, though we were informed that the price would be £100.

French Motor Cycles for 1914.

THE firm of Terrot et Cie., Dijon, have made several alterations to their models for 1914. Among them are a new change-speed gear on the twin-cylinder 4½ h.p. and foot brakes to all patterns.

Peugeot Frères are inclined to be very reticent concerning their future plans, but in all probability they will adopt the Armstrong hub gear for next year. A new change-speed gear, of Peugeot's own design, is also talked of. The agent in France for Kempshalls, Mr. J. Sheen, is marketing a motor cycle for 1904 with three speeds and clutch. This is a lightweight 1½ h.p. and fitted with a Franklin engine; the weight is stated to be under 50 lbs. and the price £24.

The new model Alcyons are a 3½ h.p. and 5 h.p. twin with two speeds and chain transmission, the gear box forming part of the crank case casting. The makers of the Debaune motor cycle, which is fitted with the Della Ferrera engine, have a new model, with 650 c.c. engine, for sidecar work.

The Clément, which is one of the French models conforming most to British ideas in design, will not alter in appearance appreciably. The steering head and lugs for the tubes radiating therefrom are made in one piece, which gives great rigidity, particularly for sidecar work. The front and rear hubs are provided with hollow spindles, so that a pin passed through the hollow part secures the wheels in the forks and allows them to be quickly dropped out when required, a very useful and desirable feature.

The Motosacoche, so well known to British readers, will, so far as the French models are concerned, be practically the same as the English ones, but the 3 h.p. (54×75 mm.) and the 6 h.p. (64×77 mm.) will be fitted with kick starting devices.

The Jouve Cycle Car.

The Jouve cycle car is of French origin, and will be exhibited at the Salon, which opens to-morrow, Friday, the 17th inst. It is fitted with a V twin J.A.P. air-cooled engine (85×85 mm. = 964 c.c.), Claudel carburetter, and Bosch magneto. The transmission is by enclosed chain to a three-speed and reverse gear box, thence by another enclosed chain to a cross-shaft, and finally from this cross-shaft to the rear wheels by two enclosed V belts. The enclosing of the transmission is an excellent feature. The steering pillar is raked considerably, and the steering box is provided with a worm and wheel steering gear. The frame is tubular, and carries Lanchester type front springs. The rear wheels are not sprung, but the two-seated side by side torpedo-shaped body is suspended at the rear on C springs, which are shackled to the seats like a sidecar. The hand brake lever applies contracting bands to the rear hubs, and a foot brake is also provided. This chassis closely follows English cycle car practice.

650×65 mm. tyres are fitted to wire wheels, and the selling price is £140.

New Smith Speedometer.

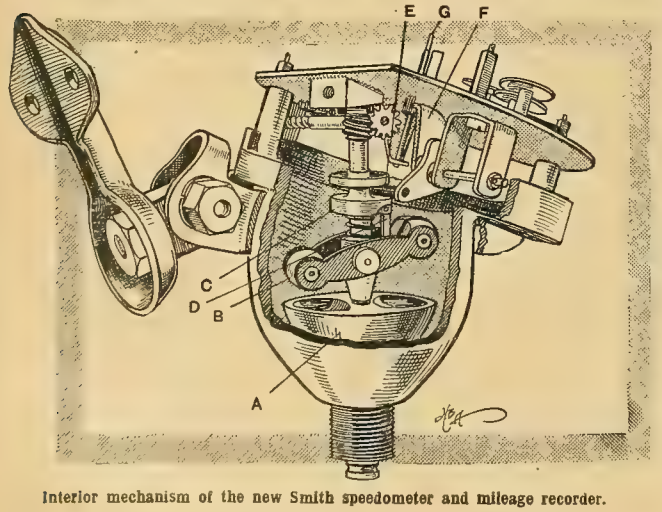
THE speedometer we are about to refer to is the production of Messrs. S. Smith and Sons, the well-known watchmakers in the Strand, who have lately opened extensive showrooms and works at 185, Great Portland Street, W. Every part of these instruments is manufactured with the greatest care at the company's factory, which is situated above the showrooms, and we were particularly impressed by the excellent finish of the article and the up to date methods of manufacture. In general, the Smith speedometer follows the lines of others which work on the centrifugal principle. In detail, however, especially as regards the governor, the design has been altered. The sectional drawing which accompanies this short article clearly shows the working. The governor is provided with a cup-shaped flywheel A, which has a sort of gyroscopic action and ensures steady running. Fixed to its spindle, and revolving with it, is the governor proper, B, which consists of two steel cross members provided with brass weights at each end.

Normally, when at rest, it assumes a more vertical position than that shown. As the speed of the shaft increases its position tends to become more horizontal, and in course of doing so it moves the double collar C which is connected to the governor proper by the short shaft D. The spindle E, which runs between the faces of the double collar, is likewise carried up the shaft, and, being attached to the toothed quadrant F, and meshing with a pinion fixed to the spindle G, conveys motion to the indicator hand which is attached thereto.

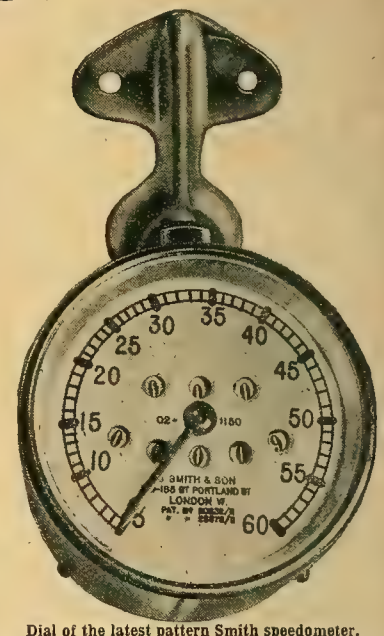
Mileage and Trip Recorder.

The mileage recorder and trip mechanism are driven by the worm at the top of the shaft. The governor shaft is ground after hardening with the greatest accuracy, and the double collar is a perfect fit on the shaft. The latter runs in ball bearings top and bottom, and the working parts are lubricated from a small grease cup at the top of the instrument. The clearness of the dial and the arrangement of the mileage recorder figures are shown in the accompanying photograph.

The clip fitted to the speedometer illustrated herewith is not the motor cycle type, but is designed for cycle cars. It is ingenious and has practically a universal movement, which greatly facilitates fitment. It must not be thought that Messrs. Smith and Sons only confine their attention to speedometers. Being watchmakers they sell excellent motor cycle watches, and glancing through their new catalogue, which is now in course of preparation, we noticed a new sidecar lamp, a new generator, and a very practical tool roll among the more lately introduced accessories.



Interior mechanism of the new Smith speedometer and mileage recorder.



Dial of the latest pattern Smith speedometer.

THE "CUT-OUT" REGULATIONS.

From reports received it appears that the L.G.B. Order rendering it compulsory for efficient silencers to be fitted, is being strongly enforced, a large number of motor cyclists having received summonses. It is, therefore, advisable that motor cyclists should satisfy themselves that the methods employed for the prevention of noise are suitable and sufficient.

PETROL CONSUMPTION.

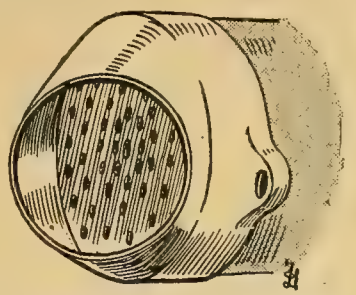
TWO METHODS OF CHECKING RESULTS.

A FORTNIGHT ago we published the results of the petrol consumption test held by the Sutton Coldfield and Mid-Warwickshire Automobile Club, and it will be remembered that the mileage per gallon accredited to the winners was so extraordinary that it was somewhat difficult to believe. The motor bicycle class, for instance, was won by T. Pollock, on a 3½ h.p. twin James, who averaged 334 m.p.g., Dixon, who was second on a similar machine, doing 320 m.p.g. The mileages of the winners of the sidecar and cycle car class, Howard Smith (10 h.p. Singer) and P. W. Hill (5-6 h.p. A.C.), were given as 87 and 101 m.p.g. respectively. As old motorists we could hardly believe some of the figures, and considered that if such really economical results were possible, the performances were deserving of further publicity.

Noticing our comments, Messrs. Howard Smith and P. W. Hill offered to repeat the performance under our observation, and we willingly accepted this sporting offer. As Mr. Smith was the first to write us, we communicated with him, and incidentally mentioned that we should prefer the second test carried out in a rather different way, viz., by using a separate petrol tank holding, say, a quart of spirit. It may be remembered that the Sutton Coldfield Club's method of measuring the petrol used was for the competitor to come to the starting point with his tank full, cover the course of twenty-four miles, the officials subsequently replenishing the tank and checking the amount of petrol required to fill it.

Now, in our opinion, this method is open to many inaccuracies, for such small points as tyre inflation and sag of the springs would affect the level of the petrol and also the result. Besides that, there is the possibility of air locks in the petrol tank. We do not see that any good purpose would be served by our observing another test carried out on the lines the organising club adopted, because our figures would likewise be open to inaccuracy, and it would further appear that we doubted the ability of the officials of the Sutton Coldfield Club to check correctly the results by the method adopted, which is by no means the case. Mr. Smith, on the other hand, is not agreeable to using a separate tank as we suggest, and which we consider the only reliable method of testing the consumption, and consequently the test will not be proceeded with.

We regret that the matter must end there, unless our conditions are agreed to, which is unfortunate, as the discussion has aroused considerable interest, and a number of letters have reached us expressing the different writers' pleasure at our having taken the matter up.



Silencer end seen on a successful Triumph at the Coventry Club's hill-climb. The curved outer plate screens the exit holes.

The Limit Reached.

The result attained by the Singer (87 m.p.g.) is equivalent to a ton milegae of 58.725. Now Mr. Poppe in his article on K fixes the absolute limit of consumption at 59 ton miles per gallon with a petrol consumption of .65 pint per horse-power hour. Taking the gear of the Singer as 4 to 1, K for this car works out at 205—a rather high value, which should enable a gradient of 1 in 9 to be climbed on top speed—and the ton miles for this value of K amount to 24, making the actual mileage 35.5. All these figures are for a good macadam road. Thus, according to Mr. Poppe, the absolute limit for the 10 h.p. Singer in miles per gallon is 87.4.

THE ANTI-GLARE VISOR CAP.

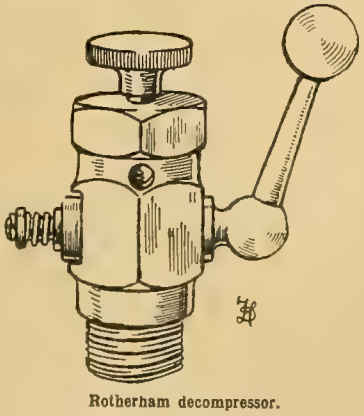
What cyclist or motor cyclist has not at some time or other received a fright on passing a car with glaring head lights?

We illustrate herewith a special cap for motor cyclists, the invention of Mr. Henry Sturmey, the object of which is to enable riders to face the glare of motor car head lights without being dazzled. The cloth cover is clipped back at night, and when a car is encountered the peak is pulled down, so that the eyes are shaded by it from the bright light. Some difficulty was met with in the selection of a suitable colour, that finally decided upon being a certain shade of orange which effectually subdues dazzling rays and yet does not obscure one's vision of the road ahead. The cap will be marketed under the name of the "Anti-glare Visor Cap," and sold by Messrs. Bramco, Ltd., 1, Ellys Road, Coventry.

The Bramco Anti-glare Visor cap.

ROTHERHAM DECOMPRESSOR.

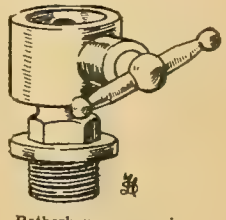
This decompressor, which has a valve which allows a portion of the gases to get away under compression, so reducing the pressure in the engine, is of the flat type, and when forced against the upper seating by the compression, the gas escapes through holes in the side of the decompressor body. The handle which operates it has a fibre ball on the end, which enables it to be handled when hot.



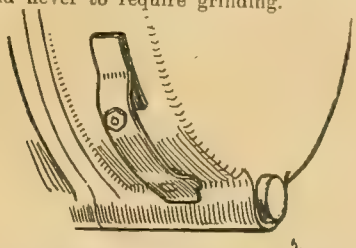
Rotherham decompressor.

NEW COMPRESSION TAP.

The gunmetal compression tap we illustrate has been purposely designed by Messrs. Rotherham to suit motor cycles where there is little head room between the tank and the cylinder. It is also constructed with a screw-down ball tap instead of the usual type, some of the latter having given trouble through the handles breaking off, due to the constant contraction and expansion affecting the metal. The screw is also more certain in action because it cannot stick, and the joint, which is formed by a ball and seating, cannot leak and is said never to require grinding.



Rotherham compression tap.



New spring oil drain plug noticed on a trade Triumph entered for the Coventry hill-climb.

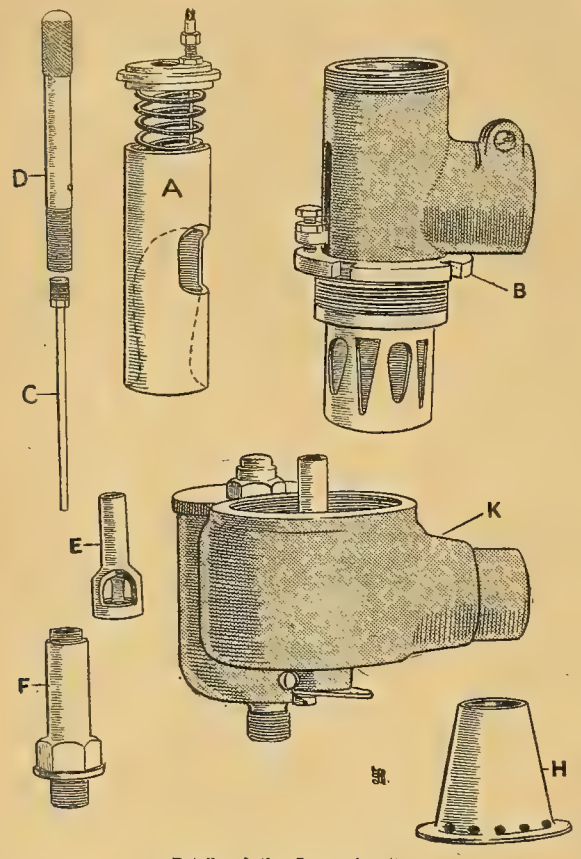
The Cox Streamline Carburetter.

A Single Lever Instrument of Ingenious Design.

ONE of the simplest automatic carburetters we have yet seen was recently shown us by Mr. A. Cox, whose name is well known to those motorists who have followed car competitions.

The principle of the carburetter is to obtain an automatic balance between the throttle opening, air opening, and jet orifice. This effect is produced in the following manner:

The body of the carburetter is a plain vertical pipe having a mixture outlet at right angles to the bore of

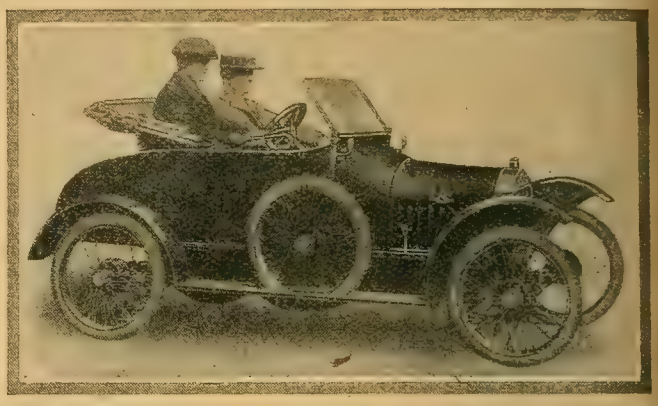


Details of the Cox carburetter.

A. Throttle barrel.
B. Carburetter body.
C. Jet needle.
D. Needle carrier.
E. Needle guide.
F. Jet.
H. Air choke tube.
K. Float chamber and hot air intake.

the pipe. In this body slides a throttle barrel of peculiar shape A. It will be noticed by reference to the sketch that the air passage (as shown by dotted lines) is arranged to give a streamline effect, hence the name of the carburetter. The throttle barrel is normally held down by the action of a coil spring, but may be raised by means of a Bowden cable, thus uncovering the throttle port and at the same time opening the air ports seen at the bottom of the body B.

Now the throttle barrel carries with it the jet needle C, which by means of the screwed needle carrier D can be raised or lowered in relation to A by simply turning the milled head from the outside. The effect of this is to vary the pick up of the engine, for the jet needle is only taper for a short distance, there being



The 1914 model 8 h.p. Enfield Autolette which, as will be seen, has a new and improved type of body. The chassis has been improved in detail only, but the Autocar Enfield Co. will introduce an additional four-cylinder model for 1914

two long parallel sections, one at each end, which control the size of the orifice. Thus it will be seen that the action of opening the throttle and air also increases the amount of petrol which is allowed to flow and automatically corrects the mixture. A special guide E is screwed on to the top of the jet F and keeps the needle central, while the jet orifice is faced with nickel to prevent undue enlargement. A small amount of air for slow running reaches the jet through the cone H, and the quantity may be regulated by the small lever at the base of the hot air jacket K. The small adjustment visible, projecting from the slot in fig. B acts as a stop to prevent the throttle being entirely closed, and so regulates slow running.

The carburetter we inspected was designed for passenger machines, and we are told that it has proved very satisfactory, and we are looking forward to a trial at an early date, as so simple a carburetter as the Cox Streamline should have a big future. The device is to be handled by the Electric Ignition Co., of Sampson Road North, Birmingham.

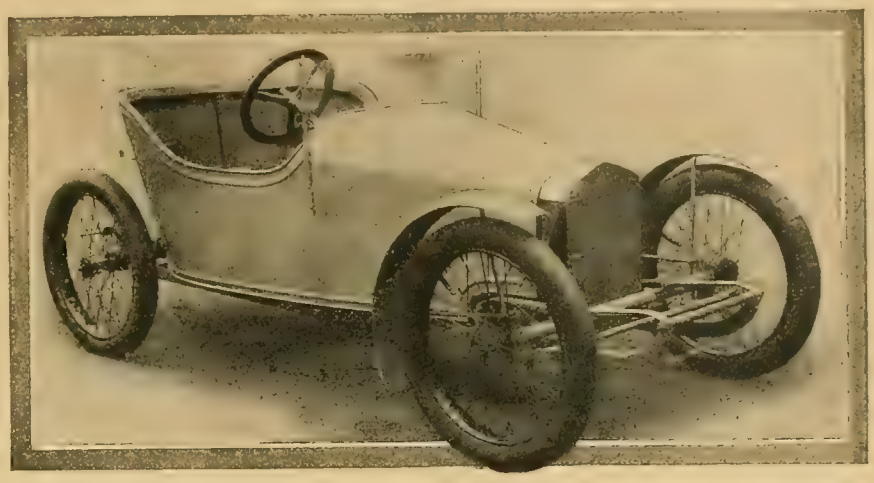
The latest model 10 h.p. four-cylinder A.C. four-wheeler at the summit of Swerford Heath Hill in the Coventry club's hill-climb.

An Original Two-stroke Cycle Car.

Features: Two-cylinder, Two-stroke Engine; Three Speeds and Reverse; Foot-starter; One-piece Body.

WE have just inspected one of quite the most interesting cycle cars that it has been our lot to come across up to the present. It is manufactured by Messrs. Ralph Jackson and Edwards, Altrincham. The designer is an eminently suitable person to undertake such work, for he was responsible for the Eagle runabout, which obtained such a vogue some seven or eight years ago, and which in its day supplied a link between the car proper and the motor cycle, and thus was one of the precursors to the modern cycle car.

Any vehicle coming from Mr. Jackson's designs is likely to strike an unconventional note, and this is the case with the Jackson cycle car, but in calling it unconventional we do not in the least imply that it is in any way freakish. Quite the contrary, in fact, for practically every detail incorporated is well tried, and the novel fitments are all on the lines of ingenious improvement.



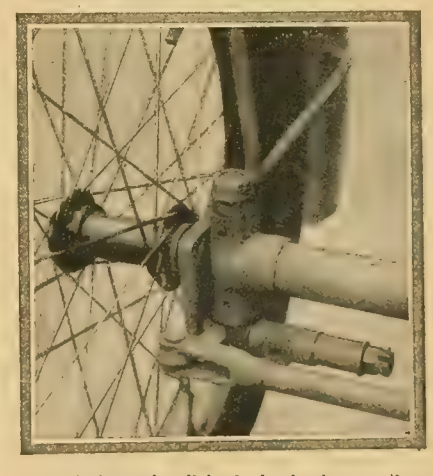
The complete 8 h.p. underslung Jackson, showing one-piece body, large wheels and tyres and neat radiator.

The Engine and Foot-starter.

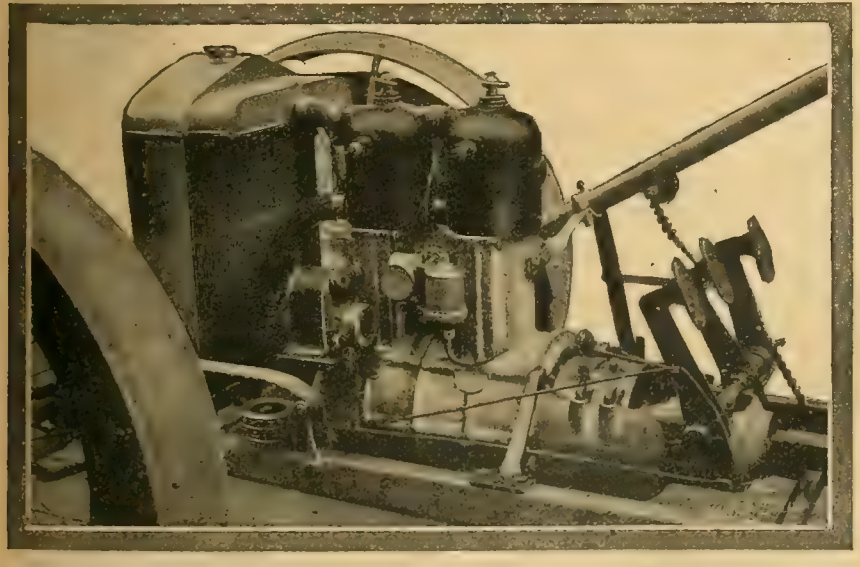
To start with the motor is a two-cylinder two-stroke placed vertically in front. The cooling of the motor is by thermo-syphon circulation of the water in conjunction with a very neat design of radiator made up by plain straight copper tubes without gills. One of the cleverest things about the motor is the casting of the base chamber to come up and meet the cylinders, the aluminium base having the transfer ports cast integral. The gas is supplied by a Senspray carburetter, delivering the mixture into the base chamber extension to the cylinders. Ignition is by Bosch magneto, chain-driven from the front end of the crankshaft. —Lubrication is by force pump, delivering oil to all bearings under a pressure of about 30 lbs. This is a great advance on general cheap car design. Another great improvement is the entire removal of a starting handle, the motor being started from the driver's seat by means of simply pressing down the left pedal, which has stamped on its face the word "Start." This is effected by the pedal being connected rigidly to a yoke, so that when the pedal is depressed the top half of the yoke moves forward and the bottom half rearwards. At the two ends of the yoke are cables connected to a chain running on two horizontal rollers, and thence carried round the forward end of the crankshaft. It is obvious that pressure on the pedal causes the chain sprocket to revolve, carrying the crankshaft with it, and as the yoke is long, considerable leverage is obtained, and the shaft is easily rotated at sufficient speed to start the engine.

Transmission and Springing.

The gear is a three-speed and reverse arranged on the epicyclic principle, the gear bands and drums being encased in an extension of the base chamber casting, close up to the engine, thus ensuring perfect alignment. There are no side levers of any description on the chassis, the control throughout being by pedals. From the gear box the drive is by a long shaft to the worm driven back axle, the worm being underneath its wheel, but there is no angularity on the propeller-shaft which would entail wear on the universal joint, for the whole chassis is under-slung, front and rear. This naturally gives great stability, and at the same time allows the side members of the frame to be kept narrow and straight throughout. One of the most striking points about the rear axle is the absence of brakes on the wheels themselves, but two internal expanding brakes are fitted inside the differential box. The effect of this design is to give great neatness to the rear end of the chassis, but the obvious disadvantage is the possibility of small metal particles worn from the brake shoes



Patent hanging link shock absorber on the Jackson two-stroke cycle car. The hub link swings radially on the long bearing.



Jackson two-stroke engine showing starting device which is worked by the driver's left pedal.

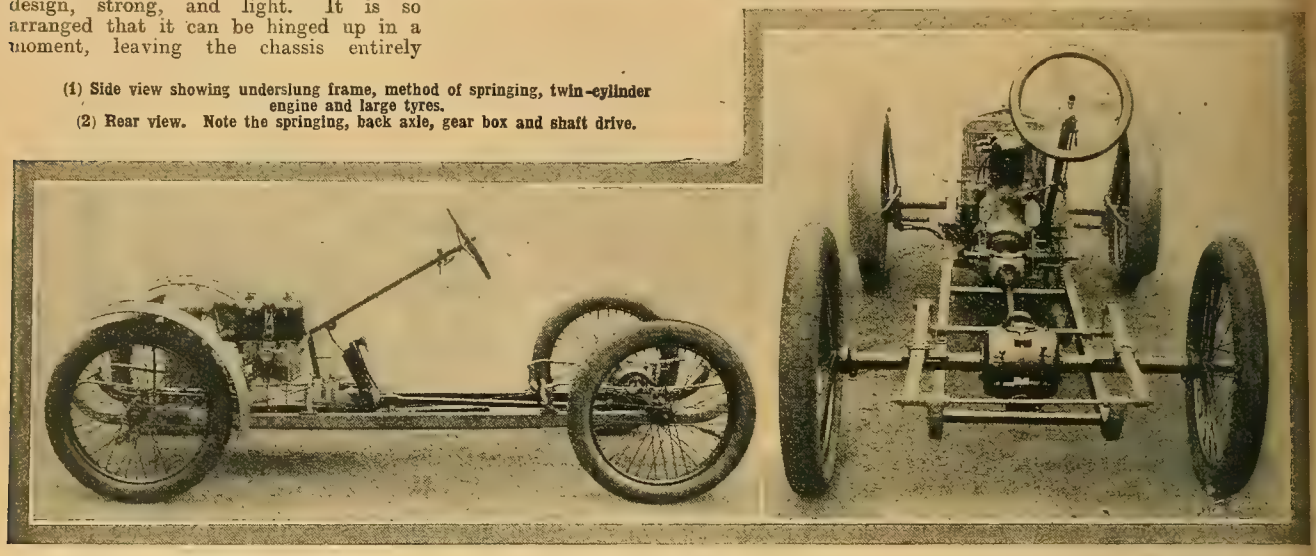
An Original Two-stroke Cycle Car.—

Another excellent effect obtained is that of rendering all four wheels detachable and interchangeable.

The coachwork is a remarkable piece of work, even in these days of clever panel beating, for it is all in one piece with the scuttle dash, and is both graceful in design, strong, and light. It is so arranged that it can be hinged up in a moment, leaving the chassis entirely exposed for cleaning or adjustment. This type of body ensures an absence of all irritating little rattles, so difficult to avoid on most light coachwork.

The Jackson will be made with two different engine sizes, though the chassis will be standardised. Although of staunch construction, the chassis weight, we are assured, is considerably under 6 cwt.

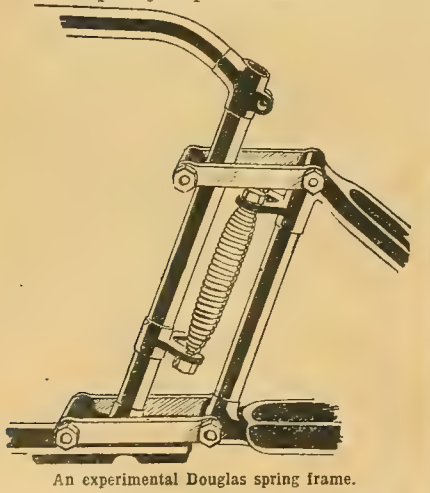
One final point should be noticed. The little car is provided with tyres of 90 mm. section, the designer realising, evidently, that the speed obtainable with this class of machine makes a generous tyre size advisable, and in the long run economical.



(1) Side view showing underslung frame, method of springing, twin-cylinder engine and large tyres.
(2) Rear view. Note the springing, back axle, gear box and shaft drive.

AN EXPERIMENTAL SPRING FRAME.

The subject of spring frames and their desirability on motor cycles has many times been discussed in these pages, consequently it was a great pleasure, when on a recent visit to the Douglas works, to notice a 2¾ h.p. mount fitted with a spring frame. Mr. Douglas impressed on us the fact that it was a purely experimental model and



An experimental Douglas spring frame.

that nothing will be marketed without thorough test. As will be seen from the accompanying sketch, the springing is on similar lines to those of the Douglas front fork, that is to say, the rear part of the frame has shackles top and bottom, and its movement is controlled by double coil springs in tension, which support the rider and the rear part of the main frame, and allow the back wheel to rise and fall over inequalities in the road.

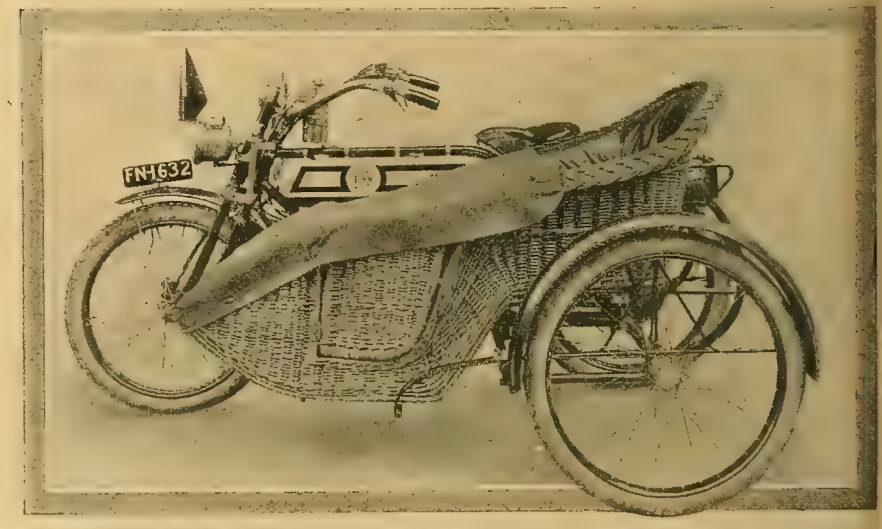
F.N. SIDECAR FOR 1914.

A complete F.N. sidecar outfit is to be marketed in 1914. A standard design of sidecar has been settled upon of the wicker variety, and it will retail at £10 10s. There are a number of special features about it, including double parallel tubes to the frame, particularly easy "C" springs, and a specially strong mudguard security. The method of security can be seen in the photograph, the stays all terminating at one point, and, in fact, forming an inverted "V."

The four-cylinder two-speed F.N. is largely used for sidecar work, and this fact has naturally induced the makers to market the complete vehicle.

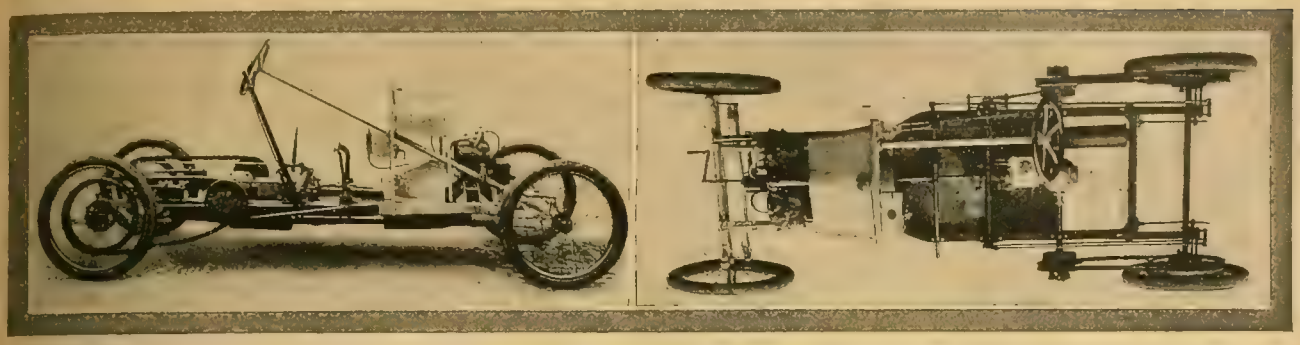
G.W.K. 1914 MODELS.

The G.W.K. firm is one of the few cycle car manufacturers who have been successful with the design of their vehicle from the very first, and consequently it is not strange to have to record that the 1914 models have been but slightly altered. The engine head is now domed instead of flat so as to provide an extra water space, a centrifugal instead of a geared pump is to be fitted, wider timing chains are now supplied, and the back axle and bevel are of B.N.D. steel. As, during the year, the G.W.K. had a magnificent record of successes to its credit, it is absolutely in the front rank of cycle cars.



A new departure for the F.N. Co. is the 5-6 h.p. complete sidecar outfit illustrated above. Observe the strong mudguard stays to the sidecar wheel.

Another New Cycle Car.

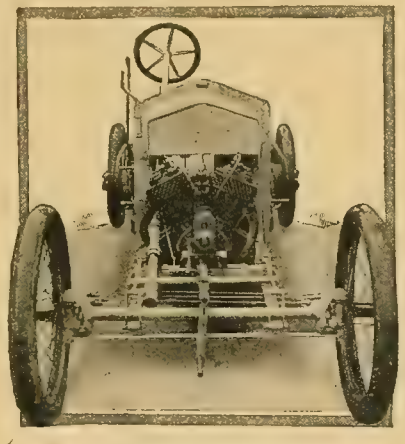


THE 8 h.p. WATER-COOLED DEPTFORD.

Side view of chassis. Plan view showing gearbox and transmission-shaft.

THE Deptford Motor Co., 2, Evelyn Street, Rotherhithe, S.E., have introduced a new cycle car, which is really the outcome of the Duo, as Mr. de Peyrecave, having severed his connection with the latter company, has now devoted his attention to the production of a new vehicle, which is to be known as the "Deptford." The model which we inspected the other day was not quite in its final state. The first chassis is fitted with a Precision engine, while the new type will be driven by an 8-10 h.p. Blumfield, 88 × 90, twin-cylinder, either air or water-cooled. The magneto will be gear-driven and forced lubrication will be fitted. At the present time the carburetter is the Claudel-Hobson, but the final type of carburetter has not yet been decided upon.

The chassis is of channel steel, inswept at the front and strengthened by cross members. The engine is set transversely in front of this, and the drive is through a large 13in. leather to metal cone clutch, and between it and the gear box the power is transmitted by means of a shaft provided with a leather universal joint at each end. The gear box contains two speeds and reverse. There is only one moving pinion, which slides on a feathered shaft, and engages the top speed by meshing with an internally toothed ring, while movement in the other direction slides it into engagement with the second speed wheel on the lay-shaft. The reverse pinion is carried underneath. Both gearshafts have ball bearings, and the power is transmitted to the cross-shaft by means of a bevel gearing. This shaft is supported where necessary on ball bearings. On each end of the shaft are pulleys, the two flanges of which are pressed up against one another by means of an internally enclosed spring. The old Duo system of pivoting the back axle so as to take up any slack in the belt is retained, and the effect of tightening the belt beyond the normal is to force the latter down the pulley, and, consequently, give a lower gear ratio. If the lever be moved to its fullest extent it operates the cam of the internal expanding brakes, thus bringing them into action. In the final model the brake drums will be very wide, and two brakes, both internally expanding, will be carried side by side.



Front view of the Deptford chassis.

As in the earlier type Duo, wire steering is fitted and the chassis is slung on quarter-elliptical springs fore and aft.

It is interesting to note that vanes are fitted to the periphery of the female member of the clutch. The latter is enclosed, and creates a forced draught so that the cooling should be effective. Undershields are fitted both beneath the engine and gear box as far as the bevel.

The gear ratios on top speed given by the adjustable pulley can be varied between 4 and 6½ to 1, and on the low speed between 10 and 14 to 1.

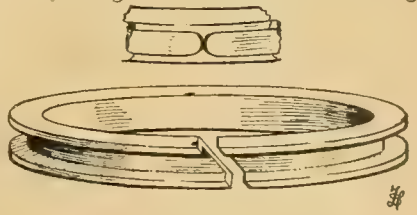
THE CYLCLEAN CLEANING PROCESS.

Although many motor cyclists prefer to take down their own engines and remove the carbon deposit themselves, there are numerous others who would gladly pay a few shillings to be saved the trouble, and it is for these that the Cylclean process is especially welcomed. In the case of a much used machine it is better to remove the cylinder, but this process can be recommended to anybody who has a new engine, in which case the internal mechanism is bound to be in good order. Recently, after a tremendous grinding in the Six Days Trials, we had one of our machines cleaned out by this process, which is, of course, an enormous saving of time. As soon as the oxygen was applied, together with the gas jet, the carbon burnt up with extraordinary rapidity, starting with a brilliant flame and ending with a shower of sparks; but the most interesting part of the process was when the oxygen was applied to the exhaust pipe, which, in this instance, was a long one possessing a curve and a flattened end, which rendered it practically impossible to clean out even with the aid of a brush. On the application of the oxygen the immense amount of oil and soot which had collected burnt so fiercely that it began by smoking like a factory chimney, followed by a burst of flame, and ending with a shower of sparks. After a few minutes' application of the oxygen every particle was burnt out, and it was absolutely clean. The cause for the engine being in this condition was due to the excessive amount of oil given to it, firstly because it was brand new, and secondly because the exigencies of the country required an abnormally low gear to be obtained through the adjustable pulley. The operation above referred to was most satisfactorily carried out by Messrs. Sully and Co., Old Town, Clapham, S.W., one of the pioneers of the Cylclean process.

The cost of cleaning a single-cylinder engine by the Cylclean process is 3s. 6d., a 2¾ h.p. twin 4s. 6d., and twins of 5-6 h.p. to 7-8 h.p. 5s.

A DOUBLE PISTON RING.

A sample of a patent piston ring has been sent us by Mr. A. E. Mengue, of Victoria Works, Englefield Green, Surrey. The device consists of a main ring on the usual lines, but recessed to take a second smaller ring within it. The smaller ring



The Mengue double piston ring.

is kept from rotating by a stop formed in the groove within which it lies, thus the diagonal slot is always covered. It is claimed that this gives better compression and tends to keep the cylinder clean. The ring has already been well proved on the Continent.

Freak Ascents of Normal Mountains.

THE adventurous motor cyclist may wake up one morning, find his engine in remarkably good tune, pack his machine before breakfast on his one thousand horse-power aeroplane, and before lunch find himself at the foot of Mont Blanc. An hour or two later will see him landing at the summit, the cynosure of the envious foot toilers. Yes, he may do this in the wonderful twenty-first century to come, but I do not think he will carry out such an expedition any time much nearer than 2000 A.D.

But he has gone quite a way towards training for such a project. Already Ben Nevis, Helvellyn, Snowdon, and Skiddaw have had to yield the peace of their rugged sides to the all pervading on-rush of the petrol engine. Where a man, mule, sheep, or goat can go, there it would seem can a motor cycle if geared low and driven by a skilful resolute driver. But, seriously, is it not about time to call a halt in this mountain scaling enterprise? One hears a great deal of the inclusion of freak hills in competitions, but when all the mountains in the kingdom are overcome, what is a miserable little rise of one in three for a few hundred yards at a time and then downhill again, perhaps, to cool the exhausted engine.

This super-climbing can be overdone. One can almost imagine nature calling out for protection against these "freak" riders. "We are quite normal mountains," Helvellyn might whisper to Skiddaw, "why then must we be tackled in this extraordinary manner?" "Yes," answers Skiddaw, "but our little brother Gastack Beck can still cause them a lot of trouble!"

There still remains a few little test hills to be conquered. The fitting of a helicopter device should make Nelson's Column quite rideable. An easier, but none the less meritorious climb, would be the several hundred steps of the Monument. There are several other likely "test hills" that could be mentioned.

FROM COAST TO COAST OF AMERICA BY MOTOR CYCLE AND SIDECAR.

The above photographs were taken during the first Trans-continental trip undertaken by Mr. and Mrs. Leroy Snodgrass on a four-cylinder Henderson, and give some idea of some of the many and varied difficulties encountered.

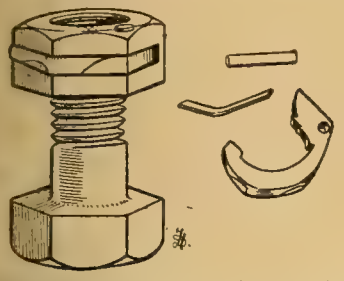
But the cold fact remains that many very ordinary motor cyclists, despite the heroic acts of the mountaineers, will continue to fail on ordinary hills, albeit mounted on apparently similar mounts, which gives one to think that the man, more than the machine, is the agent on these freak climbs.

SPARKS.

AMONG THE ACCESSORIES.

A Lock Nut Device.

We recently examined, and illustrate herewith, a device for locking nuts on pins and bolts which is automatic in action and not only locks the nut securely on the thread in such a way that it cannot turn back without a catch being released by the spanner, but the device enables the nut to be unscrewed and



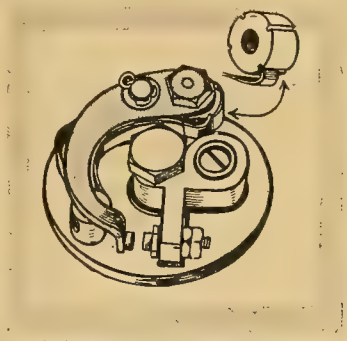
screwed up again any number of times without impairing the safety of this lock. It does not require any special tool, pin or unlocking device, and can be unlocked by the application of a jaw or box spanner from any direction. This lock nut is made by the Rex Lock Nut Co., of 40, Winchester House, Victoria Square, Birmingham. The nut is slotted at the side and carries therein a pawl, which engages with the thread on the pin On screwing up the nut the pawl over-runs until the nut comes to rest. If the nut has any tendency to unscrew the pawl engages and prevents the nut moving. To release the nut the pawl is disengaged by the application of the spanner, when the nut can be easily turned off. It is being made in all motor cycle sizes from ¼in. upwards.

The Splitdorf Magneto.

A new magneto which has made its appearance in this counrty is the Splitdorf, made by the Splitdorf Electrical Company, Newark, N.J., whose London offices are 6, City Road, E.C. The magneto may be known by name to some of our readers who have followed the motor cycle movement in the States. It is particularly well-made and is absolutely waterproof.

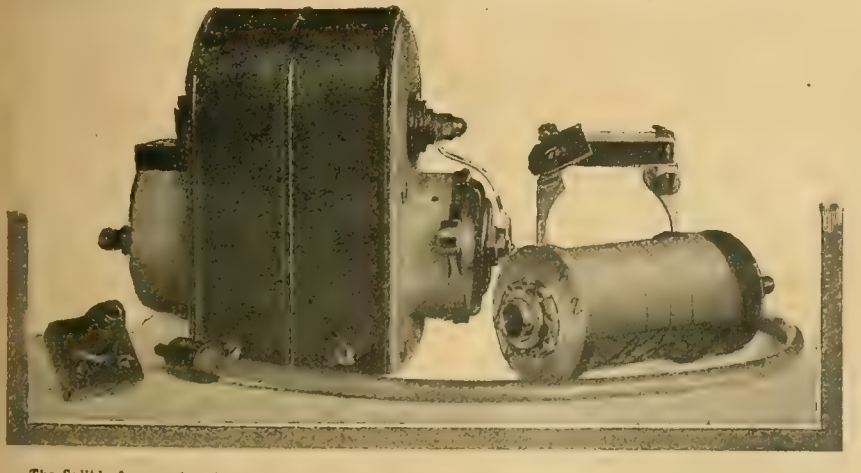
The whole follows lines usually adopted in motor cycle magneto construction, and the finish of the interior portions is distinctly good. Both ends of the armature are supported on cage ball bearings, while the condenser is carried over the armature, as will be seen from the accompanying illustration.

As regards the contact breaker; owing to centrifugal action the platinum points come into contact in a positive manner at high speed, thus permitting the use of a weaker spring and lessening the wear on the cam, while the fibre roller is adjustable for wear, the fibre being divided into sections, so that in the event of one portion being worn it may be turned round so that an unworn part comes into action. These sections are held in position by means of springs. The contact breaker is so arranged that in the fully retarded position the current is short cir-



Contact breaker of the Splitdorf magneto showing adjustable rollers.

cuited and the magneto put out of action, thus earthing the primary current from the condenser. This is brought about by means of the pin inside the contact breaker cover, which comes in contact with the spring conducting the current from the condenser. The main bearings of the magneto are provided with oil cups, which retain sufficient oil for one thousand miles. Particular care has been taken to render the high tension terminal watertight. On the whole, we are distinctly pleased with the manner in which this magneto is designed and built.



The Splitdorf magneto showing the complete magneto machine, the pole pieces with the condenser situated above, the armature, and the waterproof high tension terminal.

Spencer-Moulton Tyres.

The new Spencer-Moulton tyres, manufactured by Messrs. George Spencer Moulton and Co., Ltd., 77, Cannon Street, E.C., are excellent examples of the tyre manufacturer's work. The three-ribbed cover which we illustrate herewith is a favourite pattern. It has a long flap inside to protect the tube. There are three layers of canvas and the tread is of ample thickness. Owing to the ventilation of the tread afforded by the circumferential grooves it keeps extremely cool.

The Spencer-Moulton three-ribbed tyre.

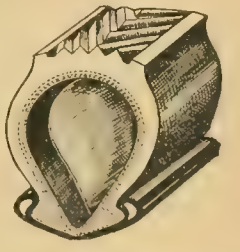
Quite a novelty is the introduction of the combination rubber and steel-studded cover, a section of which we illustrate. The tread is composed of alternate rubber lozenges and steel studs, so arranged that both rubber and steel are in contact with the road at the same time, thus ensuring a grip of the road whatever may be the condition of the surface, holding equally well on country roads and on stone setts.

Spencer-Moulton rubber and steel studded tyre.

Messrs. Spencer-Moulton have many testimonials in their books as to the excellent running of these tyres on motor cycles, and are now pursuing a vigorous policy towards making them popular among riders.

New Bates Non-skid.

Messrs. W. and A. Bates, Ltd., St. Mary's Mills, Leicester, have just introduced a new motor cycle tyre. The tread, it will be noticed, is of the herring-bone pattern, and is provided with ridges at the side, which, we are told, are excellent preventives against sideslip, rendering the tyre most suitable for winter riding. This cover will be made in the special heavy type only, 26 × 2¼, at £2 7s. 6d. per cover.



RACING AT PORTMARNOCK.

The racing season at Portmarnock was brought to a conclusion on Saturday last when the fifty miles open handicap, which had been postponed from two previous meetings, was run off, together with a six miles scratch race. The scratch race resulted in a win for F. J. Walker (Rudge), who beat C. B. Franklin (Indian) somewhat easily. There would have been a very good race in the fifty miles handicap between F. J. Walker and W. Curtis, who were both on the five minute mark, but Walker's machine was sluggish in starting and he lost a good two miles in the first five minutes. Although he ran a neck and neck race with Curtis for nearly thirty miles, he was never able to recover lost ground and ultimately was beaten by nearly five minutes.

We append the results:

SIX MILES SCRATCH RACE (500 c.c. machines).

		Time.
1.	F. J. Walker (3½ Rudge)	7m. 18⅕s
2.	C. B. Franklin (3½ Indian)	7m. 42s
3.	W. Curtis (3½ Indian)	7m. 51s.

FIFTY MILES OPEN HANDICAP (500 c.c. machines).

		Start.		Time.
1.	W. Curtis (3½ Indian)	5m.	...	1h. 6m. 0⅘s.
2.	F. J. Walker (3½ Rudge)	5m.	...	1h. 10m. 50s.

Only the above two finished.

CLUB NEWS.

"THE MOTOR CYCLE" DIARY.

Oct. 18th.—Birmingham M.C.C. Annual Autumn Trials begin.
,, Cycle Car Club Fast and Slow Hill-climb at Tilburstow Hill, near Godstone.
,, Liverpool A.C.C. Hill-climb.
,, Walthamstow M.C. Run to Harlow.

Islington and District M.C.C.

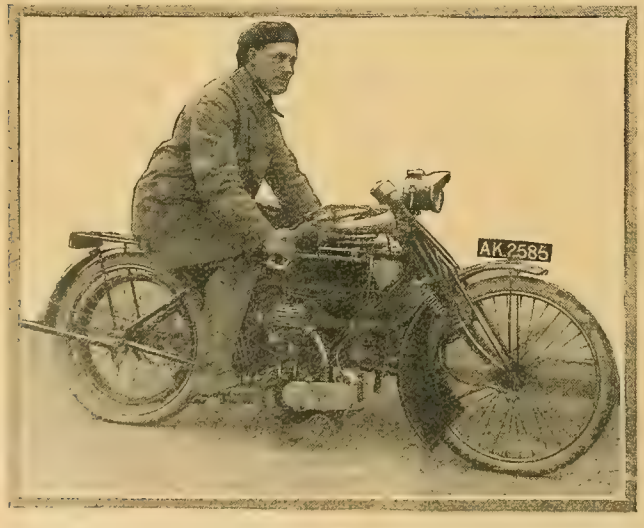
The recent reliability trial to Clacton and back resulted as follows: 1, A. G. Peppercorn (3½ Bradbury); 2, A. E. Hicks (3½ Ariel sc.); 3, H. Peppercorn (2¾ Chater-De Dion); 4, W. Briggs (7-8 Chater-Lea sc.); 5, A. Jennings (3½ Win-Precision sc.); 6, H. Ward (4¼ Grandex-Precision sc.).

Walthamstow M.C.

The W. S. Low Cup Competition was held over a course in Essex of seventy-five miles, which had to be covered twice. Competitors had to ride at 20 m.p.h. non-stop, and the nearest to schedule at checks was the winner of cup and gold medal. Some very steep hills and acute bends were encountered, and with plenty of rain falling the competitors had a very strenuous time. The results were as follows:

	Rider and machine.	Time error. m. s.
1.	G. Bax (3¾ Scott)	0 20⅕
2.	F. W. Applebee (3½ B.S.A.) ...	0 34⅖
3.	A. G. Peppercorn (3½ Bradbury)	1 54⅖

J. W. Percival, the holder (6 Chater-Lea sc.), made best time (1⅖s. error), but was disqualified for stopping on Low Hill.



F. Dodson, of Shipley, Yorks., with the 3½ h.p. Elswick and sidecar, on which he has been singularly successful in past competitions, his latest success being the fastest time in solo class, and winner of the Roland Winn trophy at the Bradford M.C.C. recent speed trials.

Malvern and District M.C.C.

The Kidderminster, Dudley, Cheltenham, and Malvern clubs are taking part in the speed trial at Blackmore Park on the 18th inst. at 2 p.m. There will be seven classes, on time and formula. The distance is roughly threequarters of a mile, with a flying start, and plenty of room to pull up, the whole distance being perfectly straight and almost dead level. The surface is in good condition, and electrical timing will be used.

Bradford M.C.C.

A hill-climb was held on the 11th inst. on Beaulah Hill, near Leeds. There were four classes to be decided—Class I., solo machines, any c.c., on handicap; Class II., any sidecar combination, on handicap; Class III., solo machines, scratch; and Class IV., sidecar combinations, scratch. Unfortunately, owing to the number of entries (over fifty) and the shortness of the afternoon, Classes III. and IV. had to be postponed until next Saturday. Results:

Class I., for the Triumph Challenge Cup.—1, J. W. M. Sproulle (3½ P. and M.); 2, S. Todd (3½ P. and M.); 3, G. Hawkin (3½ T.T. Rudge).

Class II.—1, C. Sydney (3½ Bradbury sc.); 2, Ellison Hawkes (5-6 Rudge sc.); 3, E. Stocks (5-6 Rudge sc.).

As the result of good handicapping there were some exceedingly good finishes.

H.A.R.C.

A hill-climb took place at Closney Hill, Tring. The event began in a pouring rain, the road therefore being very slippery. Results:

CLASS A.—350 c.c.

		m. s.
1.	J. T. Ganda (Douglas)	1 58

CLASS B.—500 c.c.

1.	P. Burgess (J.A.P.)	1 45

CLASS C.—1,000 c.c.

1.	S. Bhan (Zenith)	1 30

Mid. Bucks. M.C.C.

A members' speed trial took place in Aston Clinton Park, near Aylesbury (by kind permission of Lady Battersea), on the 9th inst. Results:

CLASS I.—Motor Cycles up to 350 c.c.

		Time.	Formula.
1.	H. S. Knowles (2½ Torpedo-Precision)	36⅗s. ...	1,312
2.	M. W. Allen (2¾ Douglas)	35⅕s. ...	1.387

CLASS II.—Motor Cycles over 350 c.c. and up to 600 c.c.

1.	C. H. Wright (3½ Rudge)	29⅗s. ...	1,156
2.	E. H. Littledale (3½ Ariel)	32⅘s. ...	1,187

CLASS III.—Passenger Machines.

1.	J. W. Tollady (3½ Singer sc.)	38⅕s. ...	1,356
2.	E. G. Eborn (3½ Eborn-Green-Precision)	44s. ...	1,648

The above three classes were decided by *The Motor Cycle* formula.

CLASS. IV.—Motor Cycles of Unlimited Capacity. For Douglas Challenge Cup and Zenith Gold Medal.

		Actual Time.	Handicap.	Net Time
1.	*J. W. Tollady (3½ Singer) ...	28⅖s. ...	1s. ...	27⅖s.
2.	C. H. Wright (3½ Rudge) ...	30⅕s. ...	2⅖s. ...	27⅘s.

* Winner of club gold medal.

"WHAT A NICE SIDE-CAR!

Copy of one of the many testimonials we receive :—

Rose Cottage,
Watchet, Somerset.
Oct. 4th, 1913.

Dear Sirs,

I wish to thank you for the prompt delivery of the Sidecar I received from you, and must say I am highly pleased with it in every way. It is a well made and highly finished car, and all who have ridden in it say how comfortable it is.

All my friends say "**WHAT A NICE SIDECAR,**" and I agree with them.

Wishing the "Hercules" Sidecars every success, I am, Gentlemen,

Yours sincerely,
W. M. GRAY.

"They both mean the same thing"

PERFECTION PROVED.

Proof of Pedley perfection is provided by the fact that nearly all the most important events of the last two years have been won by riders using Pedley Belts or Tyres.

Allow us to send you a list of the awards gained by Pedley. It will astonish you.

All the most successful competition riders —men who know which is the best from experience—pin their faith exclusively to Pedley.

Private users who have obtained greater mileage and greater satisfaction from Pedley Tyres and Belts, confirm the excellence of Pedley quality.

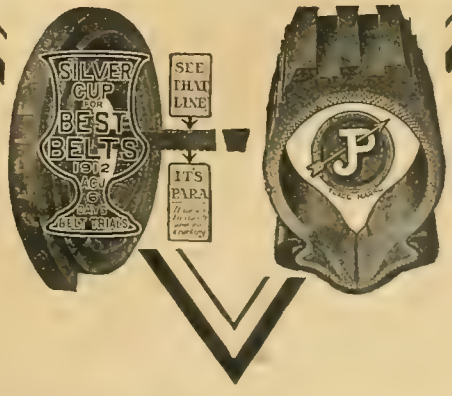
Allow us to send you copies of letters testifying to 5,000 miles and upwards, and still rendering splendid service.

PEDLEY PERFECTION IS DUE TO ONE VITAL FACTOR — QUALITY.

Pedley and Quality are inseparable terms.

PEDLEY PNEUMATIC GRIPS (Regd.) relieve all strains due to vibration, and give a magnificent gripping surface.
Reduced price .. .. 3/6 per pair.

J. PEDLEY & SON, Ltd., Gt. Charles St., Birmingham.
London: 30, Holywell Lane, E.C.



MATCHLESS

'MAKER OF MOTOR CYCLE HISTORY.'

The history of the MATCHLESS is the tale of the rise and spread of motor cycling.

Since its introduction it has gained—

15 A.C.U. CHAMPIONSHIPS,

9 SPECIAL AWARDS in the A.C.U. SIX DAYS TRIALS,

3 FIRSTS and 3 SECONDS in the TOURIST TROPHY RACES,

and been selected to represent Great Britain in

EVERY INTERNATIONAL CONTEST.

Send for Catalogue and address of nearest Agent where latest models can be inspected.

H. COLLIER & SONS, LTD., PLUMSTEAD, - LONDON.

FOR 1914
—all Twins.

For 1914 — many ingenious detail refinements, and the use of twin-cylinder engines exclusively, is the

programme. Increased efficiency —smart appearance—and very advanced designs, ensure a popular demand for the new models . . .

3½ h.p. Twin-cylinder, 498 c.c., two-speed gear and free engine, belt drive.

6-7 h.p. Twin-cylinder, 830 c.c., chain drive, three-speed countershaft gear, 26×3in. tyres.

7-9 h.p. Twin-cylinder, 996 c.c., chain drive, three-speed countershaft gear, 28×3in. tyres.

THE N.S.U. TWO-SPEED GEAR AND Free Engine Pulley can be fitted to practically every well-known make of motor cycle. Is lighter than any other gear on the market—and remarkably frictionless on the low speed.

£7 0 0 - - (with fixed pulley)
£8 0 0 (with adjustable pulley)
Including all Fittings.
IDEAL FOR SIDECAR WORK.

THE N.S.U. MOTOR COMPANY, LIMITED.

Offices and Showrooms—186, Great Portland Street, London, W. Goods and Repairs—83-85, Bolsover Street, London, W.

Club News.—

Wrexham and District M.C.

This club was formed last week, with headquarters at the Imperial Hotel, Wrexham. Hon. sec., Mr. J. R. Hardwick. It is proposed to affiliate to the A.C.U.

Harrogate and District M.C.C.

The weather was not very satisfactory when the above club held their members' hill-climb on the 4th inst., at Snowden Bank, between Otley and Blubberhouses. The hill, which has an average gradient of about 1 in 8 for nearly half a mile, was in splendid condition. Results:

CLASS I.—Lightweights.

Rider and machine.	Fig. of merit.
1. G. Hill (2¾ Sunbeam)	132
2. C. Falkenbridge (2¾ A.J.S.)	135

C. Falkenbridge fastest time, 26s.

CLASS II.—Single-cylinder Touring Machines.

1. W. E. Grange (3½ Bradbury)	147
2. C. A. Nettleton (3½ New-Hudson)	154

W. E. Grange fastest time, 22⅘s.

CLASS III.—Single-cylinder Sidecar Machines.

1. C. A. Nettleton (3½ New-Hudson)	138
2. R. Swift (3½ Bradbury)	147

R. Swift fastest time, 37⅕s.

CLASS IV.—Multi-cylinder Sidecar Machines.

1. W. Fawcett (5-6 A.J.S.)	145
2. W. N. Fawcett (6 Zenith)	152.5

P. Lister fastest time, 25s.

FINAL CLASS.—For the Pilcher Trophy, presented to the club by Messrs. Pilchers, Ltd. To be won three times in succession. The winner of each class only to compete, and the greatest improvement on time previously made to constitute the winner.

	Improvement.
1. C. A. Nettleton (3½ New-Hudson)	1⅘s.
2. G. Hill (2¾ Sunbeam)	1s.

C. A. Nettleton becomes the possessor of the Pilcher Trophy, having won it three years in succession.

Dumfries and District M.C.C.

The reliability run for the Irving Cup was held on the 2nd inst., and the results are as follow: 1, J. Smith (3½ B.S.A.), 200 marks; 2, I. Dinwiddie (5 Rex), 190; 3, T. K. Newbigging (6 Rex and sc.) and Jos. Wilson (7 Indian), 185. There were fourteen entries, but two did not turn up. T. Edgar completed the course without loss of marks, but mistook the route and was disqualified in consequence. The machine ridden by Ian Dinwiddie is six years old, with accumulator ignition.

North Staffordshire M.C.

The last event of the season, a hill-climb, was held at Winkhill, and the results appear below.

CLASS I.—Up to 600 c.c.

On formula.	*On time.*
1. J. Sproston (2¾ Sunbeam)	1. J. Sproston (2¾ Sunbeam)
2. H. W. Teeton (3¾ James)	2. C. Knight (3½ Triumph)
3. A. Miller (3½ Rudge)	

CLASS II.—Unlimited.

1. J. Sproston (2¾ Sunbeam)	1. C. Knight (3½ Triumph)
2. A. Miller (3½ Rudge)	2. J. Sproston (2¾ Sunbeam)
3. H. W. Teeton (3¾ James)	

Oxford M.C.C.

The members' hill-climb was held at the beginning of the month at a hill out of Letcombe Basset. The winners were as follows:

CLASS A (350 c.c.)—L. Eastwood (2¾ Douglas), silver medal, figure of merit 89.15.

CLASS B (500 c.c.)—S. A. Rowlandson (3½ Rudge), figure of merit 81.65; G. Blagrove (3½ Rudge), Triumph gold medal, 89.23; F. G. Alden (3½ Triumph), 93.19; F. H. Barton (3½ Triumph), novices' bronze medal, 107.26.

CLASS C (multi-cylinder, 350 c.c.)—A. James (6 Zenith), figure of merit 114.36; H. G. R. Slingo (5-6 Clyno), 127.59.

CLASS D (passenger).—H. R. Annis (3½ New Hudson sc.), Morris silver cup, figure of merit 90.42; H. G. R. Slingo (5-6 Clyno sc.), 99.79; R. Holloway (8 Bat sc.), 104.08.

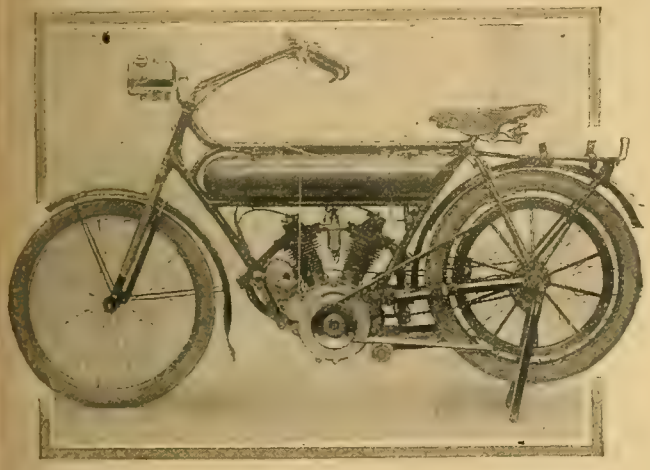
CLASS E (cars and cycle cars).—W. R. Morris (10 Morris-Oxford), figure of merit 75.13.

THE 499 c.c. TWIN MAGNAT-DEBON.

The accompanying illustration shows the latest example of the Magnat-Debon motor cycle.

The machine is a 4½ h.p. twin, the cylinders of which are set at forty-five degrees, the bore is 66 mm. and the stroke 73 mm., the c.c. being 499. The engine is a high speed one and designed to turn over at 3,000 r.p.m. Both valves are arranged on the top of the cylinder. The total weight is about 130 lbs. The machine is provided with a plate clutch in the rear hub and also with an automatic pulley.

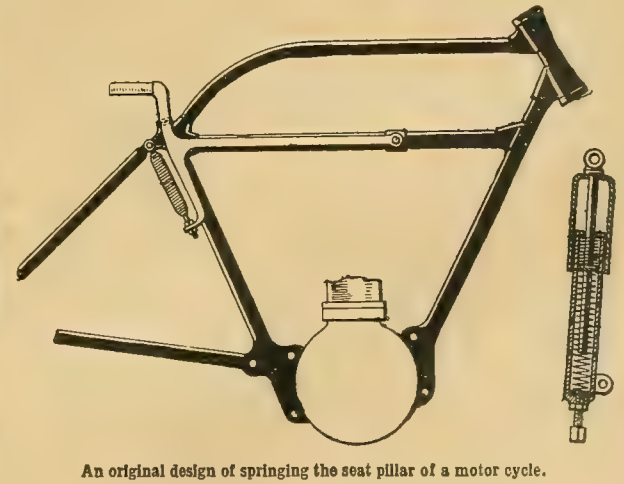
The diameter of the pulley increases according as the work absorbed is equivalent to that given out by the engine. The pulley varies in diameter from about 3½ inches to 5¼ inches.



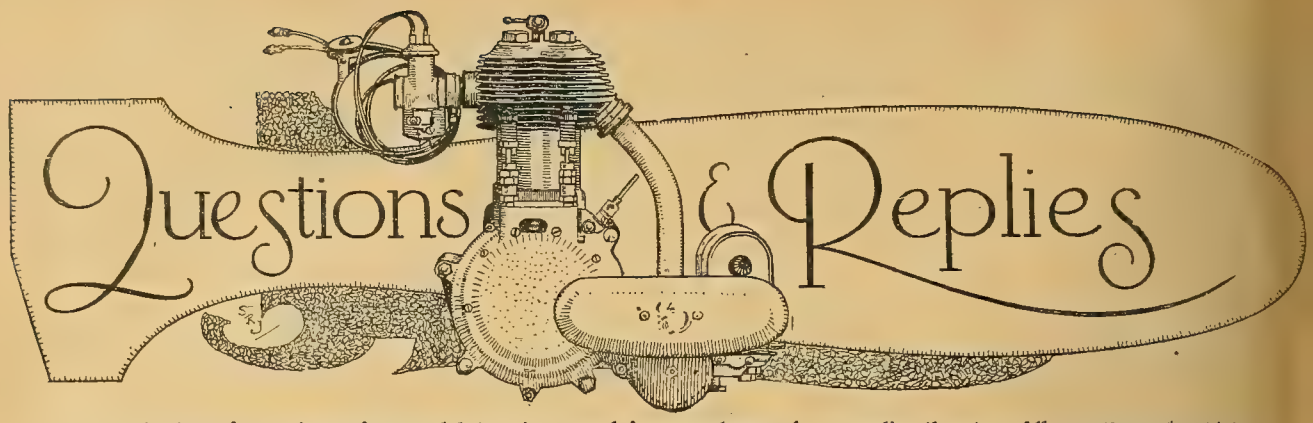
Belt side of the latest pattern 4½ h.p. Magnat Debon twin cylinder machine.

A SPRING SADDLE PILLAR.

An interesting design of spring saddle pillar is illustrated herewith. As will be seen from the sketch, the pillar is carried on long arms pivoted to the lower tank tube and suspended by tension springs from the back stays. An alternative design shows the rear end supported on compression springs. Either of these forms of suspension coupled with the usual saddle springs should give a most luxurious riding motion. The smaller illustration shows a method of enclosing the actuating springs, a recoil spring being fitted in this design. This should make the working parts weatherproof without materially increasing the weight. The fitting will shortly be marketed by Messrs. Beard-Brown and Co., Doddridge Street, Northampton.



An original design of springing the seat pillar of a motor cycle.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Walsall to Leeds.

I should be much obliged if you would kindly give me the best route from Walsall to Leeds *via* Cleckheaton.—E.V.C.

Your best route would be as follows: Walsall, Lichfield, Abbots Bromley, Uttoxeter, Ashbourne, Hartington, Buxton, Chapel-en-le-Frith, Glossop, near Holmfirth, Huddersfield, along the Leeds Road until half way to Leeds, where branch off for Cleckheaton, whence Leeds is easily reached.

A Question of Jet Sizes.

I shall be obliged if you will tell me—(1.) What are the usual sizes of jets in the Triumph carburetter? (2.) Please give the corresponding sizes on the imperial standard wire gauge or in decimal parts of an inch. (3.) The jet I am using is something between .032 and .028, but I have had to reduce the diameter of the choke tube. Should this give more economical running than using a bigger jet with the choke tube as fitted (1910)?—F.B.B.

The usual size of jet used in the Triumph carburetter is .032. The nearest corresponding size on the Imperial Standard wire gauge is No. 0, the exact size of which is .0324. The figure .032 is the equivalent in decimal parts of an inch. We should say that the combination of small jet and small choke tube will give you the greatest economy and coolest running.

A Tour in Scotland.

A friend and I are taking a tour to Scotland, making our headquarters Drumnadrochit (fifteen miles from Inverness). I should like to know the most direct route to Inverness from Nottingham, main roads only, and the distance? What would you recommend as an alternative route? As we wish to do the largest half of the journey on the first day, where would you recommend staying the night?—E.A.L.

Your best route would be as follows: Nottingham, Mansfield, Worksop, Tickhill, Doncaster, Ferrybridge, Aberford, Wetherby, Boroughbridge, Leeming Lane, Scotch Corner, Barnard Castle, Middleton-in-Teesdale, Longtown, Gretna Green, Lockerbie, Beattock, Abington Inn, Symington, Lanark, Carluke, Newmains, Cumbernauld Station, Denny, Stirling, Callander, Lochearnhead, Killin, Aberfeldy, Ballinluig, Pitlochry, Blair Atholl, Dalwhinnie, then by the direct route to Loch Laggan, Spean Bridge, and along the chain of lochs to Fort Augustus and Drumnadrochit. This is the prettiest road. The most direct route is to go straight up the Great North Road (which is signposted by the R.A.C.); after Scotch Corner make your way to Darlington and then go through Nevill's Cross, Newcastle, Alnwick, Berwick, Dunbar, Haddington, Edinburgh, by ferry to Burntisland, then through Kinross, Perth, Dunkeld, Blair Atholl, Dalwhinnie, Kingussie, Carrbridge, and Moy to Inverness. The distance is approximately 416 miles. If you go by route 1 you could stop the first night at Moffat, which is just off the main road by Beattock. You will find a good hotel here. If you go by the other route stop the night at Alnwick.

To Prevent Water Freezing.

I shall be glad of information respecting the following: (1.) Will an addition of glycerine prevent water in the radiator, etc. freezing; if so, about what proportion to the gallon? (2.) What is the advantage of an adjustable wind screen on a cycle car? Would it not be as well to have the screen fixed so as to have as little wind resistance as possible, say, at about 45° to 60°?—W.J.

(1.) The addition of glycerine to the cooling water can be added until the specific gravity of the mixture is 1.1. This means approximately 30% of glycerine. This will be proof against freezing down to zero, but below that the mixture will freeze. Probably you will find the best course to pursue is to use ordinary water, and to drain out the radiator and cylinder when there is danger of a frost. (2.) The only advantage of a wind screen such as you describe is that it can be made more comfortable, and constructed so that it keeps draughts off the driver. If you wish to decrease wind resistance to a minimum the best thing to do is to have no adjustable screen at all but a small fixed screen at an angle such as you suggest, which would, of course, largely combine the advantages of screen and little wind resistance.

A 1 in 3 piece of road on to Rodborough Common, near Stroud. The machine climbing the gradient is a B.S.A., ridden by Kenneth Holden. The sidecar is the one used at Brooklands.

Cheshire to Bucks.

I shall be obliged if you will mention: (1.) The best route from Runcorn to High Wycombe direct. (2.) Ditto, *viâ* Leicester. —N.G.S.C.

Your best routes would be as follows: (1.) Runcorn, Tarporley, Whitchurch, Hodnet, Wellington, Bridgnorth, Kidderminster, Alcester, Stratford-on-Avon, Banbury, Deddington, at Sturdy's Castle inn turn left and go through Bletchington, Islip, Wheatley, and on through Stokenchurch to High Wycombe. (2.) To go *viâ* Leicester go through Northwich, Congleton, Leek, Ashbourne, Derby, Leicester, Market Harborough Northampton, Wolverton, Winslow, Aylesbury, Princes Risborough, to High Wycombe.

How to deal with a Fire.

A few days ago my carburetter suddenly caught fire, and I am at a loss to know the cause, as the inlet valve was not sticking at all. Perhaps you can help me. The facts are as follows: The machine is a 1909 Triumph fitted with 1913 Triumph cam wheels, giving greater lift on the valves, B and B. adjustable carburetter, with jet on full—probably leaking slightly, as it wants a new needle; gauze cap on air inlet taken off. The carburetter took fire thirty or forty yards after starting, when engine was quite cold. Perhaps you can also tell me what you advise doing in such a case, after turning the petrol tap off -whether to get on and ride fast until the petrol is exhausted, or to smother the flame with cap and coat. I took the latter course, but did not lay the machine down on its side, which, I suppose, I should have done.—AB 69.

Unless the inlet valve stuck and there was a blow-back, we cannot account for the fire. The best plan in a case of this kind is to turn off the petrol and knock out the flames with your cap. Do not, whatever you do, lay the machine on its side. This might cause the petrol to leak out from the filler cap, which would naturally considerably aggravate the danger of a serious conflagration. If the flames get a real hold the only way to put them out is to smother the machine with sand or earth.

Continuous Running and Overheating.

A friend of mine, whilst the modern motor cycle engine was under discussion, stated that it could not be run for hours on end owing to overheating. I denied this, instancing the long periods the Messrs. Colliers and Martin and others have put in on tracks. I believe a ten or twelve hours record was put up and the times given in your paper about five years ago. We shall be glad if you will please give us your decision on this point.—C.H.

A well-tuned engine will run for an indefinite period without overheating. The longest record is that put up by H. A. Collier—700 miles—which he accomplished at Canning Town in twenty-four hours, on May 5th and 6th, 1909. As a matter of fact an engine is just as hot after fifteen minutes' running as at the end of twelve hours' running.

High Petrol Consumption.

I should be much obliged if you would give me advice on the following points. My machine is a 1911 T.T. Bat (overhead valves). It will not fire regularly at less than 40 m.p.h., and does 35 m.p.h. with the throttle lever in the fully closed position. When the lever is moved towards "open" about ½in., the engine practically ceases to fire, but when opened further it is perfectly all right. The carburetter is of a well-known make, which I have taken to pieces, and which seems all right, though the slide and barrel are worn, to which I attribute the gas leaking through, with the lever in the "closed" position. The carburetter is often wet as though with perspiration, and sometimes I hear a noise like the discharge of an air gun in the region of the carburetter. This only continues intermittently for a few yards and is then all right again. The petrol consumption is enormous, about twenty-five miles to the gallon. It has been like this since I bought it, but as it is very fast and really runs very well, I have not worried about it.—G.M.

The carburetter seems hopeless, and we feel sure you would do better with a change. If you want absolute controllability, you should buy one of the newer automatic type, which, however, might be not quite so efficient, but would be far more economical and would enable the machine to be throttled down much more. The condensation is due to the absence of any warming device, which is, of course, highly desirable, especially at this time of the year.

READER'S REPLY.

Loss of Power in New Hudson.

I think if "J.A.H." will look to his timing gear he will find the trouble. I recently had the same symptoms, and found that a small collar on the bell crank lever actuating the exhaust tappet was broken up, causing the valve to receive about half its usual lift. The owner had driven several hundred miles with his machine in this state, and there was nothing to indicate the trouble till the lift of the two valves was compared. —H. BRAITHWAITE.

EXPERIENCES WANTED.

"J.C." (Holborn). — Morgan. Reliability, springing, and upkeep.

"Limit Gauge" (Cheshire).—Suitable costume for lady riding a Scott.

"A.W." (Droylsden).—General experience of Wolf 2½ h.p. and Levis.

"H.S.H." (Kent).—Lighting obtained by a small dynamo or dry cells. Efficiency of light, and reliability of outfit.

"H.O.M.L." (London). — Mileage obtained from back tyre of 7 h.p. Indian with sidecar.

"S.P." (Stroud Green).—Humber 2 h.p., single-speed. General capability, wear of belt, etc.

"E.R." (Manchester). — Four-cylinder F.N. and various 5 h.p. twin and single-cylinder machines.

"F.W.N." (Bessbrook).—Auxiliary 1 h.p. motor. Reliability and cost of upkeep.

"A.H.W." (London). — Lomax non-skid band. General reliability and anti-skid properties. Is its use detrimental to the tyre?

"H.W.W." (Hassocks).—7-9 h.p. Peugeot engined motor cycle. Hill-climbing, consumption, speed, and reliability.

"J.S.D." (Altham). — Sturmey-Archer three-speed gear on 3½ h.p. sidecar combinations.

MIDLAND OPEN RELIABILITY TRIAL.

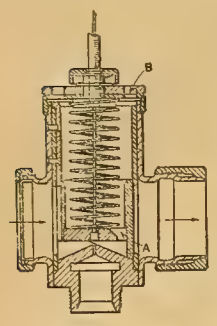
(1) J. Dudley (2½ h.p. Hobart) starting the ascent of Flagstaff Hill, near Abberley.

(2) Group of competitors lined up for the flexibility test.

(3) G. A. Gregson (Bat-Jap) on the bad corner of Farlow Bank. Gregson has performed very consistently in this year's competitions.

The Single-lever Amac Carburetter.

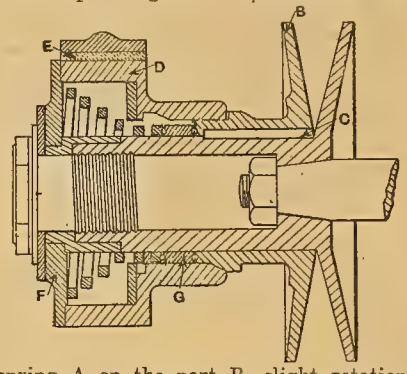
In this carburetter the jet outlets are arranged at the centre of a horizontal air passage, and above this moves vertically a sliding piston engaged by a spring and actuated by a Bowden wire. The air passes through the carburetter in the direction of the arrows, the pistons serving to control the admission of air to the jet nozzles and the passage of gas from the carburetter. In the piston is formed a leak device A, whereby air entering through the adjustable holes B can be caused to dilute the gas just before it leaves the throttle. This feature is the secret of the successful operation of the carburetter at low speeds.—F. H. de Veulle, No. 20,237, 1912.



A Philipson Pulley Improvement.

In the pulley illustrated the spring operates in a different manner from that of the original construction. The movable flange B is free to slide on a key C on the boss of the fixed flange, and has a quick thread connection with the governor member D, which in this case is provided with a brake band E. Between the outer plate F and the movable member B is the compression coil spring A above referred to, and the inner end of this spring exerts its pressure through a ball thrust ring G. In operation, when the member D is retarded by the brake band E, its screw

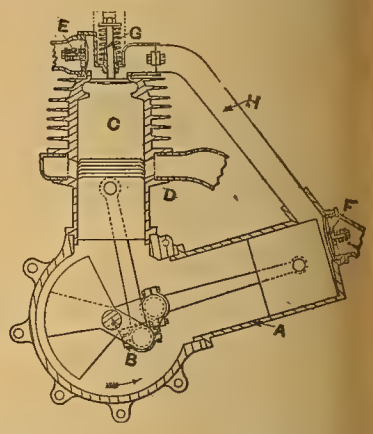
thread connection with the part B will move the latter outwards, compressing the spring A. It has been found that the return movement can be effected by the simple longitudinal pressure of the



spring A on the part B, slight rotation of the governor member D, of course, taking place at the same time. Thus a simplified construction is afforded.—W., T. W. H., and P. C. Philipson, No. 20,797, 1912.

A Two-stroke Scavenging Engine.

The difficulty with the ordinary type of two-stroke motor is to get rid of the burnt gases before the fresh charge is admitted to the cylinder. In this engine a separate pump cylinder A is employed for this purpose, and driven from the crankshaft B in correct relationship to the power cylinder C. The exhaust ports are shown at D. The engine is assumed to run in an anti-clockwise direction. On the suction stroke of the pump piston air is drawn into the pipe H through the valve E, and at the same time mixture from the



carburetter enters at F. On the compression stroke of the pump piston, and just as the piston in the power cylinder C has uncovered the exhaust ports D the valve G is timed to open, allowing the mixture compressed in the pump cylinder A and pipe H to pass into the working cylinder, expelling the remaining exhaust gases. By this time the power piston has again covered the exhaust ports on the return stroke, and a full charge of fresh gas is compressed for the next explosion.—J. L. Rhys, No. 22,000, 1912.

New Use for a Garage.

The garage of the Bentinck Motor Co., Trent Bridge, Nottingham, is at present being converted into a picture palace.

Irish Motor Directory.

We have received a copy of the latest edition of the Irish Motor Directory. This book has grown considerably in size and is sold at 2s. 6d. net. The bulk of the book is given over to a list of owners of cars and motor cycles registered in Ireland, together with the numbers.

West Country Guide Books.

The Homeland Association, Ltd., 15, Bedford Street, Strand, W.C., have sent us three handbooks, being the official guide books to—(1) Bath Abbey, (2) Fowey, and (3) Liskeard and Looe. These handbooks are published at 6d. net, and contain several views of the places in question.

Cycle Car Engines.

In our description of the Dorman engine in the issue of October 2nd we stated that these engines were being used by Messrs. G.W.K., Ltd. Messrs. W. H. Dorman and Co., Ltd., inform us that this is not quite correct, as the G.W.K. engine is a special production of the latter firm's design, and is not obtainable except on their cars. The G.W.K. and the Dorman engines are both of the twin-cylinder vertical water-cooled type, but otherwise are not similar.

The Self-sealing Rubber Co., Ltd.

The eighteenth annual report of the directors of the Self-sealing Rubber Co., Ltd., discloses a net profit for the year ending August 31st, 1913, of £3,185 8s. A dividend of 10% and a bonus of 5% is declared.

The "Earwig" Sidecar.

W. F. Guiver, of the Haven Motor Works, 739, Old Kent Road, S.E., informs us that he was the designer of the sidecar body called the "Earwig," used by E. B. Ware at the last B.M.C.R.C. meeting and the Brighton Races.

Parcelcars in London.

Messrs. Sydney Westall and Co., Ltd., 143-145, Great Portland Street, W., inform us that they have taken over the sole agency for London and the South of England for the Wall Parcelcar. They will carry a large stock of spares for these vehicles. In addition to selling Wall Parcelcars, they will also undertake their total maintenance either at their works at Chelsea or at their garage near Hyde Park Corner.

Bargains in Accessories.

In the annual autumn sale at Gamages Holborn, E.C., we note various bargains in the motor cycle line.

Catalogues Received.

The Dunlop Rubber Co., Ltd., Aston Cross, Birmingham, send us a copy of their latest price list of motor cycle tyres and accessories.

A Good Lamp Essential.

On the occasion of the recent non-engine-stop run from London to Edinburgh by Rex Mundy on an 8 h.p. water-cooled Williamson and sidecar, it was imperative that the driver should experience no lamp troubles, and also have a really bright and clear illumination of the road. Mundy used the F.R.S. head lamp, and experienced not the slightest difficulty with it, and was able to travel at a good speed.

The Watford Speedometer.

We have had one of these excellent speedometers in use for something over 5,000 miles. During this service it has never given a moment's trouble, nor has the bracket become loose on any single occasion. The hand is dead steady at all speeds, and when the speed is constant it might be to all appearance a black line drawn on the face of the instrument. We have several times tested it against the watch at various speeds, and have found it remarkably accurate.

Brandon House,
Little Holland,
Clacton-on-Sea.
6/10/13.

Messrs. The Rex Motor Mfg. Co., Ltd.,
Coventry.

Dear Sirs,

Having been initiated into the wonderful pleasures of Motor Cycling, I don't think I can do better than follow in my Brother's footsteps.

As you are doubtless aware, he has ridden Rex Motor Cycles since 1902 and travelled over 94,000 miles. On his various Rex machines he has won five Gold Medals in five London - Edinburgh - London competitions. Although I am quite a novice I find your Sidette the limit of reliability and comfort, it is simplicity itself to manage, and its appearance has been highly admired by everyone.

I have much pleasure in enclosing photo, showing myself driving with my Brother as passenger.

Wishing you every success in the coming season,

Yours faithfully,
GRACE WHITE.

Price £75.

OLYMPIA STAND 81

THE STAR CYCLE CO., Proprietors: The Star Engineering Co., Ltd., WOLVERHAMPTON.

London and District Agents: E. S. Thomas & Co., 154b, Great Titchfield Street, London, W.

STAR MOTOR CYCLE

Oil for Winter,

must be fairly light in body and free from any tendency to gum up on standing. Objectionable, wasteful petrol injection should not be necessary. The oil must be rich in refined neutral fatty matter to compensate for the light body and to give efficient lubrication under severe conditions.

WINTER

Huile De Luxe

is ideal for chilly, damp weather when ordinary oil gums up the engine or runs like water directly it warms up.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

To the prospective purchaser of a second-hand mount the

COLMORE GUARANTEE

is EXCEPTIONALLY INTERESTING. It runs:

"We guarantee every second-hand motor cycle we sell to be in good and usable running order at the time of the purchase, considering always its make and age, and that no apparent fault exists to our knowledge in connection therewith (errors in design always excepted)."

Now this is a clear and straightforward undertaking, and the Colmore depot, with 20 years of clean and fair trading record, stands behind every word.

HUMBER, 3½h.p., September, 1912, 2-speed, free engine, Dunlops, handle starting, splendid condition; £32/10. Wilkins, Simpson, and Co., 11, Hammersmith Rd., London. [2772

2¾h.p. Cranbrook Motor Cycle, Bosch mag., B. and B. carburetter, all accessories, only been out once; £50; private owner.—The Motor and Cycle Co., 60, Cranbrook Rd., Ilford. [2777

MOTOSACOCHE, 1912½, 2½h.p., free engine, mag., Druid spring forks, 120 m.p.g., upkeep low, overalls, lamp, horn, spares; £22/10 cash.—32, Melfort Rd., Thornton Heath. [2889

RUDGE, 1912, F.E., 1913 Senespray carburetter, new front tyre, 2½in. Pedley on back, lamp, horn, and spares; £34, no offers.—Vaughan Jones, 92, South Hill Park, Hampstead, N.W. [2687

1913 Rudge, 3½h.p., free engine, absolutely perfect, very fast and powerful; trial at one day's notice; tyres new condition; bargain, £40, or near offer.—P.E.S., Preyste House, Petworth. [X3341

TRIUMPH, 1911[illegible] F.E., condition excellent, P. and H., exhaust whistle; nearest £33; exchange 7h.p. Indian, 2-speed, cash adjustment.—H.C.B., Rose and Crown, Woodford Green. [2892

SCOTT, July, 1913, perfect condition, ideal winter mount, fast, reliable, spares, tools, accessories, touring and T.T. bars; cost £75, accept £57/10.—Perkin, 14, Bloomsbury Sq., London. [2693

TRIUMPH, 1909 (11/12), new Jan., 1910, Palmer cords, Cowey speedometer, overhauled Triumph Co., new cylinder, piston fitted, many spares; £26/10.—23, Station Parade, Leytonstone. [X3181

DOUGLAS, model G, single gear, new Oct., 1912, with P. and H. lamp, horn, Stewart speedometer, ridden under 1,000 miles; bargain, £30 for cash.—E. M. Grice, Bletchingley, Surrey. [2688

3½h.p. New Hudson, 1913, absolutely new, free engine, kick starter, B. and B. carburetter, Armstrong 3-speed gear; retail cash price £57/15, what offers?—Rice Bros., Guildford. [2833

PHELON and Moore, Ltd., 4, Percy St., W., have several good second-hand P. and M. machines for sale, which have been overhauled and are in perfect order.—Can be seen at above address. [0131

N.S.U. 3h. p. Twin, fitted with 2-speed variable gear, new 3 months ago, has only done 500 miles; price £38, cost £60, with accessories.—Esmond, Holborn Hall, Gray's Inn Rd. 'Phone: 6492 Holborn. [0362

6h.p. Semi-T.T. Bat, July, 1913, Armstrong 3-speed, kick starter, Kempshalls, done 300 miles, lamp, horn, tools, demonstration; £65; buying car.—Aeroplanes, Vardens Rd., Clapham Junction. [X3089

TRIUMPH, 1911 model, fitted with clutch, overhauled by makers, splendid order, with or without sidecar, £34; also 1912 T.T. model, £32.—Smith and Ford, 172, Upper Richmond Rd., East Sheen, S.W. [2752

T.T. Singer, 1913¼, 3½h.p., special model, guaranteed perfect, do over 50 m.p.h., Brampton variable, Cowey, numerous spares; giving up; £40.—Thoroton, 2, Avenue Gardens, St. Margaret's, Twickenham. [2728

P. and M., 1912, just overhauled, excellent condition, X'all bucket saddle, Cowey speedometer, Hanmer lamp and generator, nearly new back tyre; £45.—Rev. J. Danglish, R.N. Barracks, Shotley, Harwich. [X2953

DOUGLAS, late 1912, Model K, with 1913 clutch and pulley, condition as new, £40; also 1912, as above, less clutch, £36, with lamps, horn, etc.; seen by appointment.—Smith's Garage Coggeshall. [2875

TRIUMPH, 1908, re-enamelled by makers, plating as new, engine rebored, new bearings throughout July last, also magneto overhauled by Bosch, tyres, belt excellent; £24.—Butterfield, Wentworth House, East Finchley. [X3162

FOR Sale, 1913 Scott Motor Cycle, ridden less than 100 miles; good reasons for sale; fitted with Cowey speedometer, Lucas horn, lamp, and generator, absolute perfect order guaranteed.—Apply, The Motor House, Haslemere. [2671

NEW Hudson, 1912, 3½h.p., 3-speed, new Canoelet sidecar, perfect condition, £38; Enfield twin lightweight, absolute bargain, £18; reason for selling owner leaving country.—60a, Trinity Rd., Balham. 'Phone: 1528 Battersea. [2751

1913 Triumph, 3½h.p., clutch model, 2⅜ Clinchers (unpunctured), perfect condition, £47; also Browning patent folding sidecar, new August, £8/10; trial run arranged.—Cooke, 47, Mount View Rd., N. Tel.: 105 Hornsey. [2755

DOUGLAS, model R, 2-speed gear, free engine clutch, with kick starting pedal, footboards, and new model mudguards, just arrived from works; £52, cash, or lowest easy payments.—Wilkins, Simpson, and Co., 11, Hammersmith Rd., London. [2769

WE Have a Few Shop-soiled and other Machines which have been used for competition purposes, to be sold at bargain prices. Write for particulars, or call and inspect.—N.S.U. Motor Co., Ltd., 136, Gt. Portland St., London, W. [0361

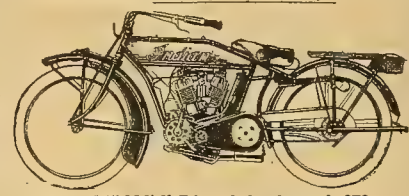
CASH Offer, immediate.—3½h.p. Kerry, speedy, reliable, perfect order, takes sidecar easily, fine solo mount, medium weight, proved particularly trustworthy in bad weather; value £35, accept £25; owner given up riding.—Rose, 45, London Rd., St. Albans. [X3203

All ready to ride away!

— All the leading makes of motor cycles in stock — new models arriving daily — including

INDIANS, JAMES, ROVERS, HUMBERS, CLYNOS, ENFIELDS, ZENITHS, A.J.S., BRADBURYS, TRIUMPHS, & NEW-HUDSONS

— the "Finest selection in the Kingdom" for you to choose from—all ready to ride away!



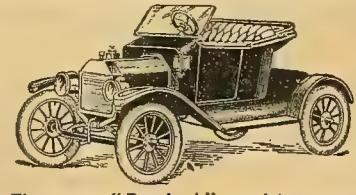
The "INDIAN" 7 h.p. twin, 2-speed, £70.

—Latest models of MONTGOMERY, CANOELET, GLORIA, MILLS-FULFORD, etc., Sidecars in stock.

£10 to **£60**

50 "Shop-Soiled" and "Second-Hand" motor cycles in stock from £10 to £60 each — all well-known makes — all thoroughly overhauled and guaranteed in perfect condition for riding. Full list on request.

— If you wish to invest in a small car, I can give you fullest information on any make, and will assist you in choosing the most suitable car for your special requirements. My stock includes:



The FORD "Runabout"	complete	**£135.**
PERRY	complete	**130 gns.**
HUMBERETTE	"	**£125**
FORD "Touring Car"	"	**£150**
SINGERS	"	**£185**
CALTHORPES	"	**£168**
ALLDAYS "Midget"	"	**£138**
G.W.K.'s	"	**£150**
STANDARD	"	**£185**

— all "ready for the road." Complete tuition *free* — trial runs arranged — satisfaction guaranteed.

— If you wish to exchange your present mount for a new Motor Cycle or Small Car, I will make you a generous allowance for it. Consult me on any purchase — it will pay you.

— Please CALL, WRITE, or 'PHONE me.

Single Gears.

LAST Saturday a trial for single-geared machines was held in the South of England, and the event can be regarded as an unmistakable sign of the increased efficiency and dependability of present-day engines. Three or four years ago a similar event over such a severe course as was selected might have ended in a *fiasco*, but such is the efficiency of the modern engine that nineteen not only stayed the course but accomplished non-stop runs.

It seems to us, however, that the event is likely to be misunderstood by some readers, more especially prospective riders, who may be led to imagine that if a single-geared machine can successfully cover such a course, why bother with change-speed gears which, after all, are added complication and costly items. For fear any such should be unsettled in their minds as to the type to select at Olympia, we pen these few words of advice. We have ourselves always had a sneaking liking for the single-geared semi T.T. type of mount, as it is so light, nippy, and sporting to ride, but such a mount has its drawbacks. Owners of such must always choose their touring ground unless frequent stops to alter gears are to be made, and there are other points which we desire to make quite clear to the uninitiated in the choice of a mount. For instance, success in climbing a steep hill with a fixed gear is largely dependent upon a clear course, a good dry road surface, a comparatively straight hill, and acquaintance with that hill. These conditions being favourable, a really good 3½ h.p. mount can make a steep gradient look very simple. But imagine for a moment that a horse and trap, a drove of sheep, or any other road obstruction be encountered, the single gear enthusiast is effectually checked. One may argue that a single-geared machine *can* climb a twisty hill, but our retort is that very often in order to keep up the momentum of the machine unnecessary risks are taken in negotiating corners which might prove serious if the road be not clear of other traffic. Again, on a foggy or misty day, when speed was out of the question, an owner of a single-geared mount would find himself in dire difficulties on hills. And, in addition to all this, the gear ratio used must of necessity be lower than the top gear of a multi-speed mount in order to bring hills within its range. The result is that three parts of its life the engine of a single-geared mount is turning over unnecessarily fast and using up more petrol and oil.

We could continue this discourse indefinitely, but to any thinking person or motor cyclist of experience, the variably geared motor cycle must score heavily. But trials of single-geared machines will do good if only in one respect, viz., it will encourage makers to develop still further the efficiency of their engines. It is well-known that different makes of engines of identical capacity vary very considerably in their power output, but by reason of a very low emergency gear enabling all hills to be ascended these faults are hidden in the ordinary reliability trial, but tests specially for single-geared mounts will bring them out.

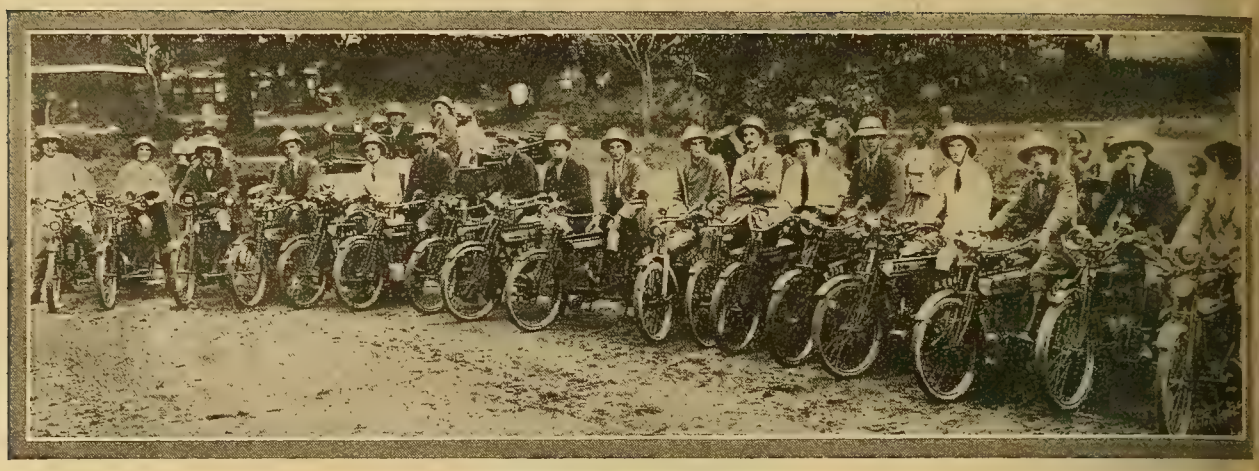
Used Carbide.

WITH reference to the practice of throwing away spent carbide at stopping places we have received the following sensible letter from a correspondent:

Sir,—Now that the time of the year has arrived that most motor cyclists carry lamps, will you draw the attention of your readers to the inconsideration of emptying carbide generators on village greens and other roadside stopping places? In damp weather the carbide thus left continues to generate for some hours, which is very unpleasant for those dwelling near; also, the heat it gives off sometimes kills the grass and gives the place an untidy appearance.

I feel sure this practice is due to thoughtlessness, and that most motor cyclists would take the trouble to throw their used carbide out of the way if the matter were brought before their notice. H. MORTIMER BATTEN.

Now we entirely agree with Mr. H. M. Batten, and, as we consider it important that motor cyclists should do as little as possible, with which the general public can find fault, we deem it advisable to give his letter the full publicity of our columns, and at the same time add a few lines to urge upon riders the desirability of following the advice given. Carbide is an excellent thing in its proper place, *i.e.*, in an air-tight tin or generator, but we all know how disagreeable is the smell of a dirty acetylene generator, and we have no right to inflict this smell upon others. As Mr. Batten says, the carbide goes on generating, for it must be very seldom that it is wholly used up in the lamp, and his condemnation of the practice is entirely justified; in addition, carelessness of this kind might conceivably be attended with some danger on account of the inflammable nature of the acetylene gas which is given off and its tendency to explode when mixed with a suitable proportion of air. Animals grazing by the roadside too might find the result interfere with their palate.



BRITISH MOTOR CYCLES OVERSEAS.
The average number of British motor cycles exported weekly is 328. They are sent to every corner of the globe. Our photograph shows members of the Rangoon Motor Cycle Club, the machines shown representing four Rudges, three Triumphs, three Humbers, two Rovers, and two B.S.A.s, one each Bat, Indian, and V.S.

The 3½ h.p. Twin Motosacoche on the Road.

DURING the summer we had on trial one of the latest type 3½ h.p. twin-cylinder Motosacoches, and considering the success this model has had this year, both in England and on the Continent, a short account of its behaviour will be of interest.

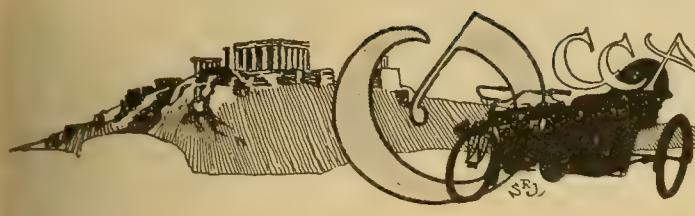
Our first ride on the machine, which was in the Isle of Man, will be long remembered. We had landed one afternoon from the *Ben-my-chree*, and at teatime it was blowing a howling gale from the south-west, and after registering at the Highway Board, we ambled down gently to Quarter Bridge, and then proceeded along the course of the T.T. races up the mountain road towards Ramsey. It was on this trip that we learnt that, owing to the adjustment of the carburetter, the machine started best on half air and ran with full air the whole time. We were literally blown up the mountain and made the ascent up to the Bungalow on one-third throttle, and coasting down into Ramsey made a short cut on to the Coast Road, reaching the latter at a point right at the foot of Slieu Lewaigue Hill —a really stiff and long climb, not freakish in the slightest degree, but as good a hill as one can find on the main road. A touch of the throttle and we sped up towards the summit. We were taking it beautifully, so well in fact that at the next corner the gas had to be cut down, then, as we rounded it easily, the gale caught us with its full force and the rain, which had now begun to fall, stung like hail; the throttle was slung open, and slowly, very slowly, the gallant engine, battling with its two opponents, the 1 in 10 gradient and the shrieking wind, picked up and brought us to the next corner. Then ensued another, this one sheltered from the wind, and then the next. Here we had a tremendous tussle, but the engine, though brand new, was pulling grandly. It did it simply by hard slogging, without a conk, and without a falter.

Details of the Machine.

Now as to the machine itself. The M.A.G. engine is really a beauty, exquisitely finished and well balanced, flexible and powerful, and is a real pleasure to drive. The carburetter, an Amac fitted with a No. 26 jet, was possibly not set to run in the most economic manner, but it was absolutely automatic and no alteration was desirable. Once warm, the engin would tick round like a car, and run at almost an speed one liked on top gear, which is entirely as i should be. From almost dead shut to full open, th throttle lever might be suddenly moved, and withou the sign of a miss the machine would accelerate wit wonderful rapidity. The engine was very quiet an practically devoid of tappet and valve noise. Th silencer was worthy of the name and clearly did nc exert appreciable back pressure, as no perceptibl amount of power was gained by opening the cut-ou The gears, which are of the expanding clutch variety changed easily and appeared to be fool-proof; th chain drive was quite devoid of harshness, as a efficient shock absorber is fitted. The foot brake ha sufficient power, but the front brake was not quite s effective, while the handle-bars were rather narrow

It is an excellent sidecar machine, and in suppor of this assertion we may draw our readers' attentio to the performances of Holroyd and Le Vack in th B.M.C.R.C. Six Hours Race, which they completec without experiencing the slightest mechanical trouble

A rider of a three-speed New Hudson at the Sphinx



OCCASIONAL COMMENTS

BY 'IXION'

Carrier Riding.

In spite of the chorus of disapproval aroused by the suggestion that carrier riding should be made illegal, as in some American States, I am not at all sure that I should not welcome an official embargo. Some of the angry remonstrants use utterly fallacious arguments when they liken it to aviation, and other pursuits which take a heavy toll of human lives. Aviation is inevitably perilous, motor cycling—apart from carrier riding—is very tolerably safe. Carrier riding is a kind of eccentric excrescence upon motor cycling, in the same way that riding on the extreme tip of a plane (as two flying mechanics did the other week) is an eccentric excrescence on aeroplaning. It is certainly stupid to forbid experiments in any novel mode of locomotion which may eventually blossom into a highly practical and useful form of traffic; it would be idiotic to prevent mono-railway experiments by legislation. But it is not idiotic to pass laws which prevent aviators flying down the Strand or carrying flappers on their rudders; and it is quite possible that it would be wise to make carrier riding illegal. There is very little to be said in its favour, for it is at least as uncomfortable as it is dangerous and it has sprung into use for two main reasons—it is cheap, and, therefore, is resorted to by persons who have no sidecars; and it is convenient, as when the sidecar is left at home and the holiday maker picks up a crimson-jerseyed flapper on the "prom." The strongest argument against it has not yet been cited in print. A man or a girl has certain ill-definded rights to risk his or her own person, if the personality be regarded as worthless or the motive for risking it sufficiently strong. But we have no right to risk the lives of others without their understanding or consent, and we have no right to risk causing great sorrow to total strangers. Carrier riding infringes both these principles. The maidens—Manx or imported—who grace the carriers of so many machines in a T.T. week have no conception of the danger they run, and probably some of the more stalwart pillion-passengers who may be seen touring England on carriers are ignorant of the fact that they run ten times the risk they would face in any car or sidecar. As regards the other point, several car drivers have killed people who were riding on carriers. I had a very narrow escape not long ago. I was driving a heavy car through the freshly watered street of a seaside town when a motor bicycle with a man on the carrier turned out of a by-lane just in front of me. It swerved as it righted itself after the bend, and I thought to myself, "This lad may be off in a minute." I took out my clutch and hung back to give him a twenty yards lead, and in less than a hundred yards his back wheel skidded, and both men were prone in the mud. If I had not shown more caution than they did I should have crippled or killed them both. This is one of many instances in my own experience, while a friend of mine crushed two youths very badly under similar circumstances. Why should we be exposed to these risks because a few infantile persons with more courage than sense esteem their lives so lightly? Whether or not carrier riding is legally prohibited, it should be clearly understood that *it is probably the most dangerous method of road locomotion in existence*, not excluding the towing of a push bicycle behind a motor bicycle.

Punctures Widening Under Patches.

Some months ago I initiated a small controversy by publishing allegations to the effect that modern tyre repair solutions were almost too good, some riders asserting that punctures often split and spread and widened under the patch, and that the patch became so completely amalgamated with the tube that it was difficult to dislodge. Mr. Surridge, of Holdtite fame, challenged these assertions so far as his solution and patches were concerned, and sent me a complete kit of his latest repair goods with which to test his claims. Unluckily—from his point of view, not mine—I have enjoyed a unique immunity from punctures all summer, and I still lack the evidence of a practical confirmation. But if we examine one of his patches, we find it is stamped with an arrow, and is intended to be affixed with the arrow across the line of the gash or puncture. If we further fix first an end and then a side of the patch in a vice, and take a good haul on it with a pair of rough-edged pliers, we find that the material of the patch is extensible in one direction, but not in another. It is so woven that it can stretch in one direction only. If the non-extensible grain of the patch is set across the line of the puncture, the patch cannot extend in that direction under any conceivable strain to which it may be subjected; and since the tube is, as aforesaid, part and parcel of the patch, neither can the tube extend in that direction; and, ergo, the puncture cannot very well extend either. I have a section of tube with two huge longitudinal slashes in it, to which a Holdtite patch is thus affixed, with its taut grain across the slashes; I cannot make these slashes widen by any mechanical means, short of ripping both patch and tube in half; and I do not see how the pneumatic and frictional strains of road wear will effect what a vice and pliers fail to do. I think Mr. Surridge has amply proved his point. A patch that was non-extensible in *both* directions would, of course, be a dismal failure under inflation; but this compromise seems to have no practical drawbacks whatsoever, and few patch makers have hit upon it. I must add a word of commendation of the substantial coin-opening tubes in which Mr. Surridge and one or two other vendors put up their solution nowadays. Friend, dost remember thy tool bag when the old collapsable tube got adrift amongst thy spanners and split?—Ugh!

A New Cycle Car Definition.

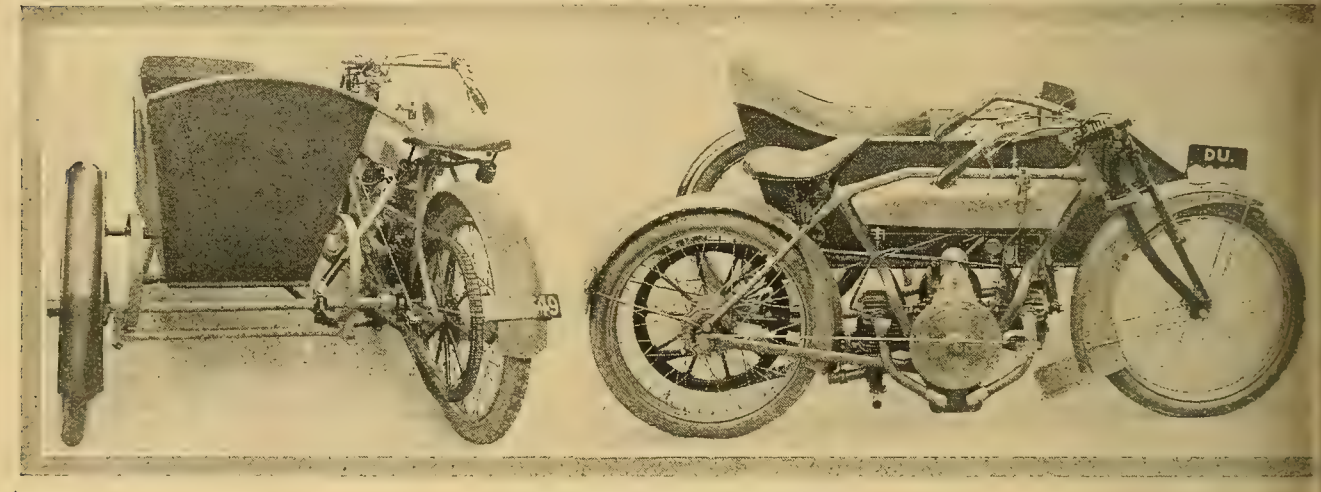
Our motor cycling politicians are loudly clamouring for a new cycle car definition. It is perfectly obvious that the world of miniature motors is at this moment

Occasional Comments.—

in a pretty state of chaos. At the one extreme we have the genuine "cycle car," by which term most sensible men, ignoring the A.C.U. definition, would imply a light passenger machine on motor cycle lines; at the other extreme we have the miniature Rolls-Royce, exemplified by such luxurious vehicles as the Singer. Both are formally termed "cycle cars" for exhibition and competition purposes. But we have by no means exhausted the oddities of the position. A Morgan runabout is a cycle car. An 8 h.p. motor bicycle, brazed up solid in one piece with a sidecar chassis, is not a cycle car. A Singer and a Morgan are classified as one type. The little 8 h.p. De Dion is not a cycle car, but the Singer, having an engine of 83 c.c. less capacity, is. The Singer would cease to be a cycle car if it weighed a very few lbs. more than it actually scales in its present form; indeed, I know at least one Singer which could not compete as a cycle car if the judges chanced to verify its submission to the definition at all precisely. Again, the little De Dion could be converted into a cycle car if an almost invisible length in millimetres were deducted from either of the engine measurements, and the chassis were stripped and lightened as many cycle car chassis have been stripped, lightened, or modified during the past year. This is chaos indeed, and it is easy to understand why some of our petrol-politicians are pressing for a fresh definition. In spite of the arguments and facts I have marshalled, I think it might be in the highest degree unwise to recast the definition at the present juncture. Any definition imposes limitations upon designers—remember how the horse-power scale of taxation has fettered motor car designers. The motor car was pretty well evolved before financial pressure stereotyped the "80 mm." and "90 mm." engines, and no harm was done; but the cycle car is in its infancy. There are, in fact, only a very, very few successful "cycle cars" in existence, for the main fruit of the movement up to date has been to develop the "miniature car," a type of vehicle which was not for one moment foreseen by the false prophets of the new motoring. We should treat an infantile vehicle as we treat a human infant, and afford the widest conceivable range of development. Definitions and limitations are, therefore, entirely out of place at the present moment, and the A.C.U. should play the wise parent, and stand aside to watch its child's development, content to extend a guiding hand only when obviously perverse tendencies become manifest. Such tendencies are not as yet invisible, if we except the hill-climbing weaknesses of some of the inferior pioneer machines, which have been corrected by the provision of sufficiently strenuous trials. After all, nobody knows yet whether a really light four-wheeler is a practicable proposition, and it may turn out that the 5 cwt. four-wheeler is a mere visionary's dream. The cycle car wants a free hand for at least another twelve months, perhaps for longer.

Another Toss.

For once I was a false prophet, for I have already had another tumble. I was taking a right angle bend in a popular watering place; the surface was freshly watered asphalt, and banked the wrong way, though I will not plead guilty to more than 15 m.p.h. on the occasion in question. The back wheel skidded as I swerved to dodge an aged female tripper. I accomplished a magnificent recovery, but before I could say what the mildest motor cyclist is prone to ejaculate under such circumstances, the front wheel skidded as well, and by some miracle I was thrown over the handle-bars, and found myself standing erect on my feet with the engine doing 4,000 r.p.m. flat on its side. Let me enumerate the damages: another 10s. of damage to my miserable 25s. lamp, an extra whorl in my hooter, two footrests dropping their ears a shade more than before, handle-bar slipped round in the stem, carburetter levers looking rather cock-eye, and the front number-plate registering a quarter to twelve. Applause from a huge crowd in honour of my landing upright on my feet softened my asperity towards the pre-occupied dame aforesaid; in fact, I think they imagined I was the knockabout sailor out of Humpsti-Bumpsti, doing a special turn in public as an advertisement. But please note the moral—my cheap lamp has already cost more in repairs than its original price. If lamps were set closer down on the mudguard, they would come off better in such mishaps. The lamp makers' repair books will point my moral.



A NEW SIDECAR OUTFIT UNDER TEST.

The first Montgomery horizontal engined motor cycle, the engine of which was described in our issue of Oct. 9th. The machine is now on test in the above form and is fitted with a new type of sidecar, the chassis of which is composed entirely of straight tubes, and is in consequence very strong and simple. The belt is high up and thereby screened from foreign matter. An Armstrong hub three-speed gear is fitted.

What it Costs to Run a Cycle Car.

THERE is a great deal of speculation as to what it costs to run a cycle car; indeed, few care to take the trouble to record every expense in connection with motoring. Perhaps it is as well they would not, for it is surprising how the many payments large and small mount up, and to a motor cyclist investing in his first passenger machine, the result might come as a rude shock. Personally, we have not found ourselves in the same boat; on the contrary, we can truthfully say that we have been agreeably surprised at the result we have obtained from the running of a Humberette. We have made occasional references to the performances of this vehicle in past issues, and promised our readers a statement of account at the end of our reckonings. The items of expenses are appended:

CAR AND EQUIPMENT.

	£	s.	d.	£	s.	d.
Humberette, less tyres	118	7	6			
Special tyres—						
3in. Skews	7	18	0			
2.5in. Midlands	6	3	0			
Extras—						
Rubber on boot	1	1	0			
Mat		7	6			
Watford speedometer and fitting	3	18	0			
Special boxes		10	0			
Two spare tubes	1	4	0			
Extra for Rotax head lights	2	15	0			
Dashboard clock		12	6			
				142	16	6

REPAIRS AND RENEWALS.

Two valve springs, one plug		5	0			
Sundry repairs		5	6			
Pair new Midland 700×80 mm. covers	4	5	0			
Watchquick 3s. and Dunlop outfits 2s. 3d.		5	3			
				5	0	9

RUNNING COSTS—3,350 MILES.

Benzole, 22 gallons at 1s. 6d. ...	1	13	0			
Petrol, 59 gallons at 1s. 9d.	5	3	3			
Oil and grease	1	9	3			
Garage, 2s. 6d. week	2	5	0			
Insurance, "Autocar" policy, including £1,000 life insurance	5	5	0			
Registration	1	0	0			
Tax and driving licence	3	8	0			
				20	3	6
Total				£168	0	9

Running expenses = 1.80d. per mile.

So that the uninitiated may not be misled, we may explain where many expenses could have been reduced, and how a more favourable result might possibly have been obtained.

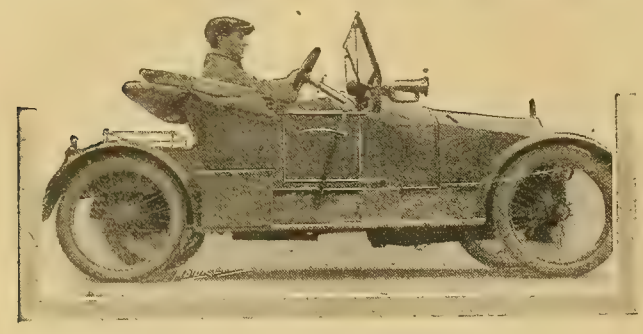
Do Extras affect the Selling Price?

"Extras"—that word to conjure with, which means a big item when equipping the vehicle, yet brings in little more when disposing of it—account for a marked increase in the total cost of running. Larger tyres are included under this head, but if only for the increased comfort (which is at once noticeable) and the comparative immunity from punctures, they are worth every penny of their extra cost. One seldom hears a motorist of any class grumble that the makers have "overtyred" his machine, but grumbles to the reverse effect are legion.

The writer feels lost without a speed indicator and mileage recorder on his motor cycle or cycle car; they render any run so much more interesting. In the present instance a mileage recorder could hardly have been saved, or a reliable guide to the cost of running would have been an impossibility. In passing, should other cycle car owners send us their running charts for

What it Costs to Run a Cycle Car.—

comparison and publication (as we hope they will), it would be better if it were mentioned clearly whether the mileage was "estimated" or recorded by an instrument. The "estimated" mileage is usually very far from the mark. We have used a Watford speedometer, driven by belt from the cardan-shaft, which method of



The Humberette referred to in accompanying article. The box on the running board accommodates a two gallon tin of petrol.

drive does not appear to be entirely satisfactory, as the belt has a habit of disappearing altogether after about 1,000 miles. On that account we carried a spare belt. As regards lighting equipment, two lamps on the dashboard answer their purpose quite well, but two good lamps attached to the sides of the frame throw a better light ahead, though the lamp glasses are apt to become splashed with mud on very wet roads.

A Small Repair Bill.

We have been singularly fortunate in the matter of repairs, for only once have we suffered a breakage, and that was due to a defect in the differential gear which the Humber Co. readily put right free of cost. Our only other troubles can be summed up in two broken valve springs—surely a splendid result for 3,350 miles! The Humber engine has opened our eyes as to the possibilities of air-cooling. At the Olympia Show last year, knowing as we did the vagaries of motor cycle engines and the hard work the 8 h.p. Humber engine was being called upon to perform, we feared valve breakages, and, as others may have shared our opinion, we are happy to be able to disabuse their minds of such an impression. At the moment we cannot recollect having run an air-cooled engine so far as the Humberette without having need to change one or more exhaust valves. The only objections to air-cooling we found were the large amount of engine oil used and the need for removing the carbon from the pistons rather frequently—the one accounting for the other. Overheating, despite the absence of any artificial means of cooling, was non-existent in our case, thanks to the low compression engine.

Benzole we did not use until after we had the cycle car some months or the charges under the head of consumption might have been reduced. Incidentally, we may mention that after trying various mixtures, we consider that a 50% mixture of petrol and benzole gave the best all round results, a mileage of 45 m.p.g. compared to 40 m.p.g. with petrol alone being obtained.

An average of twopence per mile is, to our mind, a very satisfactory result, seeing that two persons were always carried. One cannot fairly include depreciation, seeing that if the car had been run 6,0 miles very probably the same selling price would ha been obtained. It is curious that a purchaser is n usually so much interested to know the date the vehic was new or the distance run, as whether it a 1913 or current year's model. In our case d depreciation on the selling price increased the expen ture to nearly 5d. per mile, but, again, the taxes a for the whole year, and the insurance need not ha been so high for the summer only.

Finally we would suggest three minor improvemen to the Humberette. One would be to lower the das board to enable the driver to steer into a narrow gat way without leaning forward to see if the mudguar are fouling anything, another to arrange that t rear end of the tool locker should let down. At prese the luggage platform acts as the lid, and one has or to experience a couple of punctures and be oblig to unstrap all the bags, stand them on a wet road, a strap them up carefully again as we did on our ve last run, to realise that a better arrangement is possib An accessible petrol tap would also conduce economy. One cannot trouble to remove the bon every time to turn off the petrol, and it is not go enough to rely upon the carburetter needle valve af it has been in use a few weeks.

On the subject of sidecars *v.* cycle cars, the lat undoubtedly score in luggage carrying capacity a weatherproofness for driver and passenger (a l point), but they are not so fast as the average sidec especially on hills, are more expensive in first cost a running expenses, and most difficult to store. point of comfort the sidecar passenger is no better in a cycle car, but the driver is undoubtedly more co In reliability there is very little to choose.

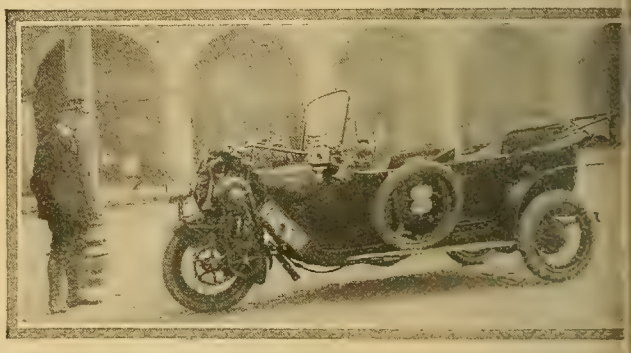
THE CYCLE CAR TAXI.

THE illustration herewith shows one of the n three-wheeled taxis at present to be seen in t streets of Berlin, Leipzig, and Munchen. T machines are all of the well-known Phänomobile ma 12 h.p. Two little fans driven by a leather belt fr the magneto shaft help to keep the engine cool.

The two-speed gear is of the epicyclic pattern a controlled from the tiller, where the carburetter a magneto fittings are also placed.

The rear wheels alone are braked, and the lit three-wheelers are remarkably steady on grease.

Naturally one would expect, with such a weight the front wheel, some little difficulty in steering, bu although a trifle heavy, it is not objectionable.

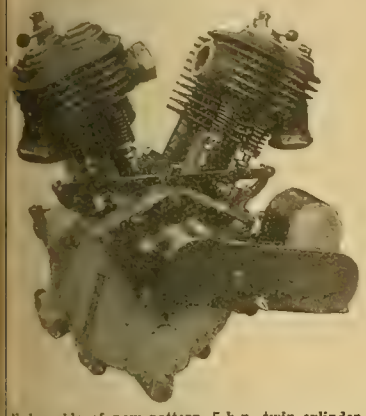


A four-cylinder Phanomobile taxi used in the streets of Berlin.

JAP ENGINES FOR 1914.

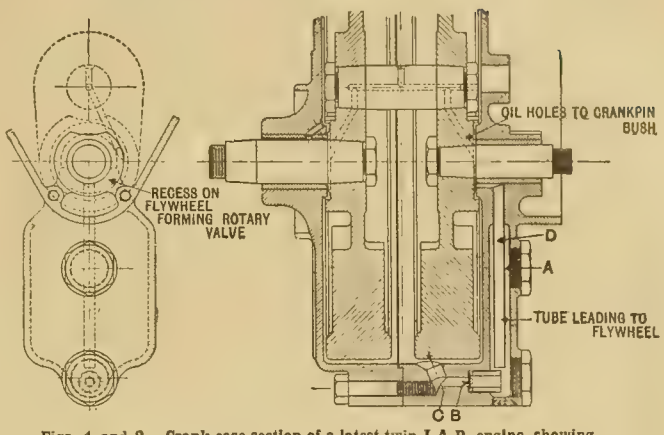
Pressure Feed Oiling. Simplified Timing Gear.

THE J.A.P. engine is the oldest and at the same time most popular motor cycle engine on the market. It was first turned out in 1903, and even in those early days was recognised as one of the leading motor cycle engines. The engines in which Messrs. J. A. Prestwich will specialise during 1914 will be all twin cylinders, a new 5 h.p. (illustrated herewith), 70 × 85 mm.; the 6 h.p., 76 × 85 mm.; the 8 h.p., 85 × 85 mm.; and the new 10 h.p. cycle car engine, 85 × 95 mm., which we also illustrate — another entirely new production. Now the chief innovations for the coming year are a simple and ingenious pressure-fed oiling system, a simplified timing mechanism, and a new type of exhaust lifter.



Valve side of new pattern 5 h.p. twin-cylinder air-cooled engine.

As regards the lubrication (the improvements in which system we were most gratified to see in view of our many articles on the subject), a separate chamber A is cast in the crank case, connected to the latter by the passage C through the non-return valve B. The descending piston forces the oil past the non-return valve into the chamber A up to a certain level which is about halfway up the chamber. Owing to the upper orifice of the brass pipe D being closed by the side of the flywheel, there is considerable pressure of air above the level of the oil. On the piston ascending a recess on the flywheel, forming a rotary valve (see fig. 1), uncovers the orifice of the delivery pipe, and the oil is delivered to the crank pin bearing. The lubricant is drawn up by the vacuum caused by the ascending piston and forced through the pipe by the pressure in the oil chamber.

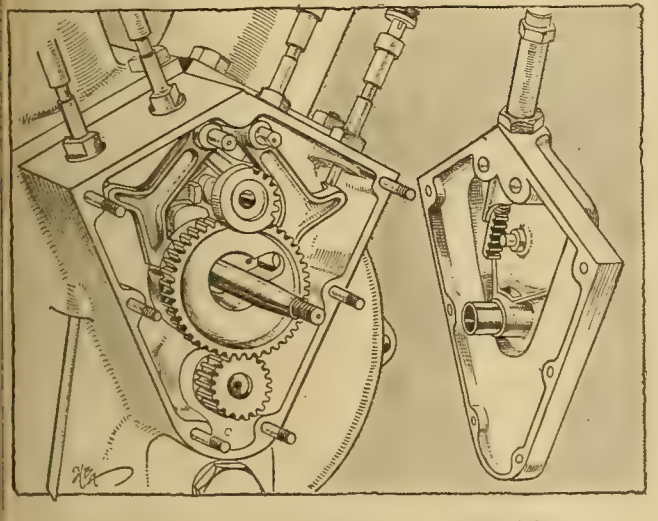


Figs. 1 and 2. Crank case section of a latest twin J.A.P. engine, showing the special oiling arrangements.

Timing Gear Details.

The simplification of the timing gear is clearly shown in the accompanying drawing. There are only two gear wheels, and of these that which revolves at half engine speed has two cams cut on the back, while a double set of rockers work the two valves in each cylinder. Not only is the design enormously simplified, but the valve is infinitely more quiet. The magneto is driven by means of a sprocket attached to the spindle on the half-speed timing wheel. The accompanying sketch also shows the new method of raising the exhaust valve, which is effected by a rack and pinion arrangement. At the back of the pinion are cams engaging with heels on the exhaust rockers. In the photographs which illustrate this article, the 5 h.p. is fitted with the old type exhaust lifter, while the cycle car engine has the latest pattern. The neat exterior of this engine is well worthy of note, while the very large flywheels are an excellent feature. During our visit, we were impressed by the delicate scientific instruments employed. Moreover, the care and accuracy employed in the manufacture of these engines observed while going round the factory caused us no surprise in view of the many successes recorded by J.A.P. engines.

The latest 7 h.p. twin for cycle cars, notable for its large flywheels.



The simplified timing gear mechanism on the J.A.P. twin-cylinder engines for 1914.

Trial of a Spring-frame Edmund-Villiers.

IT was with feelings of expectancy that we mounted an Edmund machine, fitted with a 2¾ h.p. Villiers engine and two-speed gear. This machine, noted for its spring frame, has revealed to still another of our staff the pleasure of riding a machine so fitted. It is made by Messrs. Chas. Edmund and Co., Crane Bank, Chester. Leaving London by the Finchley Road, we made our way along the tramlines towards Hatfield. We found here that the engine was misfiring, so pulling up at a garage at Hatfield we took down the carburetter, a Brown and Barlow, and also cleaned the sparking plug points. The garage proprietor showed extreme interest in the machine, stating that he gave up riding a motor cycle owing to the lack of comfort, and he deemed a spring frame to be of the utmost necessity.

From Hatfield the road was taken through St. Albans, Harpenden, Luton, and a stop made at Bedford for lunch.

Bedford was left behind, and we passed through St. Neots to Cambridge. Here we found a Triumph rider returning to Cambridge from the Army Manœuvres with various pieces of baggage trailing behind him, suffering from belt trouble.

Cambridge was reached in good time, and passing through Chesterton, Waterbeach, Stretham, Ely, Soham, Fordham, and Newmarket, we again returned to Cambridge. After a halt of short duration, we ran down the Trumpington Road, through Trumpington, and turned off to Royston. The road here was a mass of "pot-holes," yet we kept up a speed of 20 m.p.h. without the slightest discomfort. The road soon improved, and we reached Barley (situated three miles from Royston and on the main road from Cambridge and Newmarket to London) just before lighting up time.

Hill-climbing Abilities.

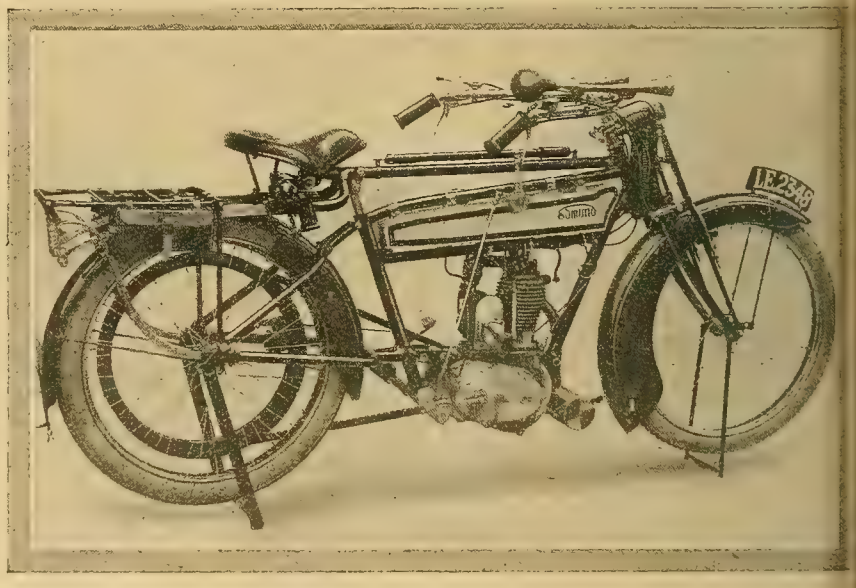
Before we started we were informed that the machine was geared low, as it had been used with a sidecar, and we expected something pretty good in the hill-climbing line. The machine was geared approximately at 5.8 and 10 to 1. Accordingly a search was made for hills, and we found we could climb all the main road hills in the immediate neighbourhood on top gear, and there are some good samples near Royston. The engine never knocked, but with the ignition slightly retarded kept plugging away without a falter.

The hill into Chishill was climbed on top gear, and hearing that there was a much steeper hill in the next village, Hayden Green, we made our way there. We found the hill, which was a rather long one with several bends, but of no great severity, and managed to climb it on top gear—an excellent demonstration of the power of the Villiers unit.

Hayden Green Ditch.

Looking round, however, we found a true hill that really required power. This hill possesses quite a useful gradient, several bad bends, and, though dry, a most appalling surface. We descended then and there for about a quarter of a mile, and then began our climb. The machine fairly jumped about all over the road, the spring frame doing excellent work. The surface was so bad that a very slow approach had to be made. Accordingly we engaged the low gear and made our ascent without having to touch the ground once with our feet, though at times the back wheel slipped on the loose surface. The hill is known as Hayden Green Ditch, and the Edmund made two clean ascents.

It was at 6.30 a.m. when we left Barley for London. The weather was very foggy and intensely cold, so that our "oilies" were soon quite wet. The return journey was quite uneventful, and the fog spoilt what would otherwise have been a very good average for a lightweight machine. We reached Piccadilly shortly before 8.45 a.m. Unfortunately, our hill-climbing efforts of the day before had resulted in the loss of

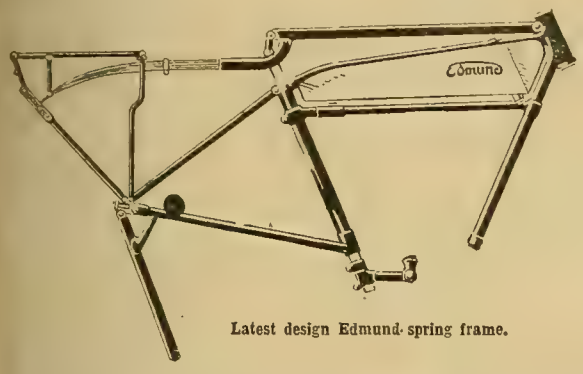


The latest pattern 2¾ h.p. two-speed Edmund-Villiers.

Trial of a Spring-frame Edmund-Villiers.—

two front mudguard bolts, a screw from the clutch control lever and one nut from the rear brake. We left Barley with about half a gallon of petrol in the tank, and there was a considerable amount remaining when we arrived in London, in spite of rather a free use of the low gear in the traffic on the Tottenham Road and in Bishopsgate. The engine never once throughout our run showed the slightest signs of overheating.

Though not fast as modern machines go, it was capable of keeping up a very good average. It was



Latest design Edmund spring frame.

excellent on hills. The engine is very free from vibration. The hand-controlled clutch is at once simple and sweet in action. The machine steers well, though, personally, we should prefer rather shorter handle-bars. Also, we should favour a different type of gear quadrant, as the gear lever is rather inclined to jump into the free engine position on bumpy roads. Again some device is needed to lessen the noise of the overhead inlet valve rocker, which spoils an otherwise quiet running engine. We would say a word for the extreme comfort of the Edmund spring frame and Brampton Biflex forks, and after riding a T.T. machine for a long period, to say the least of it, we found it very luxurious.

We are much indebted to Mr. Schuver, of 20, Clavering Avenue, Hammersmith, W., for his kindness in placing at our disposal one of the most pleasant medium weight machines it has fallen to the writer's lot to ride.

A Twin-cylinder Model.

Messrs. Chas. Edmund and Co. are also placing on the market a twin-cylinder model fitted with a M.A.G. engine of 3½ h.p., the cylinder dimensions of which are 64 mm. bore and 77 mm. stroke, giving a capacity of 496 c.c. This model is also fitted with the Brampton "Biflex" forks and an Enfield two-speed counter-shaft gear. The carburetter is an Amac and the magneto employed is a Bosch. Lubrication is effected by a Best and Lloyd semi-automatic drip-feed lubricator. In the construction of the spring frame special reinforced tubing has been introduced which combines lightness with great strength.

THE MOTOR CYCLE SHOW NUMBERS.

In connection with the OLYMPIA SHOW, three special issues of this journal will be published as follows:

Nov. 13th .. Passenger Machines of all Types.
" 20th .. Buyers' Guide of 1914 Models.
" 27th .. Complete Show Report.

An Experienced Lady Motor Cyclist.

MORE and more ladies are taking to the motor cycle both for pleasure and business purposes, but lady riders of long experience are not very numerous. Among them may be numbered Miss Mary Reid, of Fraserburgh, N.B., whose portrait with her lady's model three-speed 3½ h.p. Brough, we give. Miss Reid tells us that she first became interested in the motor cycle five years ago, and her first machine she describes as an "old warrior fitted with a 1½ h.p. motor with a high frame, but with no free engine, change speed gear, or spring forks." This machine, says Miss Reid, developed her faculties for doing her own repairs and keeping her machine in order.

After that she became, in turn, the owner of various machines ranging in power from 1½ h.p. to a 6 h.p. twin, but this year she decided to get a 3½ h.p. single-cylinder with a three-speed gear, and her choice fell on a Brough, with which she says she is thoroughly satisfied. It is built with open frame, and, indeed, Miss Reid is no advocate of ladies using a diamond frame motor cycle. In fact, she expresses surprise that so many ladies adopt this method of riding, which she considers ungraceful and likely to cause the uninitiated to rub their eyes, while, to further the cause of the motor cycle among ladies, she considers that one of the most important points is that the rider should look thoroughly graceful.

HUMBER SIDECAR MODELS.

A 4 h.p. Water-cooled Single-cylinder and a 6 h.p. Horizontal Twin.

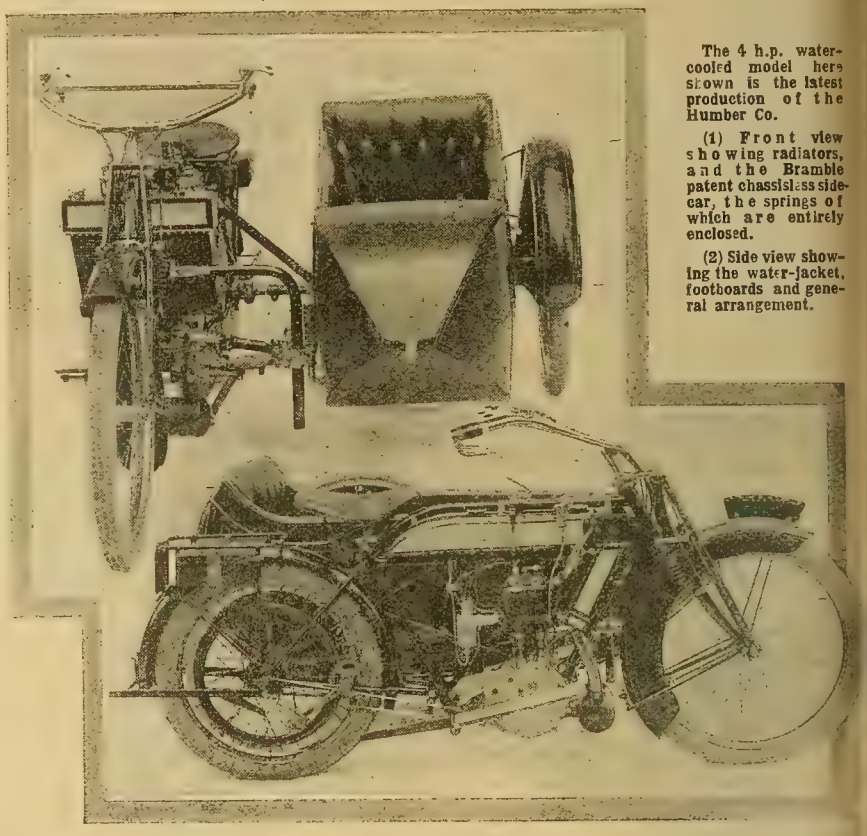
A NEW model water-cooled Humber has just made its appearance. It is one of the two machines which the company will market in 1914 especially for sidecar work. Though the frame and other details of the machine we are about to describe correspond with the 3½ h.p. air-cooled model, the engine being water-cooled, a much higher compression is possible without any ill-effect, though so far as extra power is concerned the alteration is most marked. The dimensions remain the same, viz., 84 × 90 mm., and the twin radiators, carried pannier fashion in the usual way, appear to be well proportioned, the capacity of the jacket, pipe, and radiator totalling three quarts. The cooling is by thermo-syphon system. The latest Humber motor cycles all have a larger petrol capacity, a good point which is sure to be appreciated by Colonial motor cyclists in particular. Even though the water-cooled engine has restricted the tank space in order to accommodate the water-cooling apparatus, the petrol tank has been widened, so that the capacity remains the same, viz., 1½ gallons. The standard back tyre is of 2½in. section to withstand the extra strain of the sidecar attachment.

On the Road.

We have been privileged a trial of the machine on the road, and noticed particularly the absence of fuss about the engine, which bowled along up hill and down dale at a steady 20 to 25 m.p.h. It is wonderfully controllable at low speeds, and above all it is silent, this remark applying to the valve gear also. Up Sunrising Hill after a non-stop run from Coventry is, we are assured, a comparatively easy test.

The second sidecar model which the Humber Co. will introduce we briefly announced last week. This machine will have a 6 h.p. twin-cylinder horizontal engine of novel design, and it is doubtful at present if it will be ready for the Show, though work is proceeding day and night on it. The gear box is of the three-speed sliding type, placed in the counter-shaft, and chain drive will be used throughout, combined with a slipping mechanism in the rear hub.

These two Humbers will be sold complete with sidecar attachments.

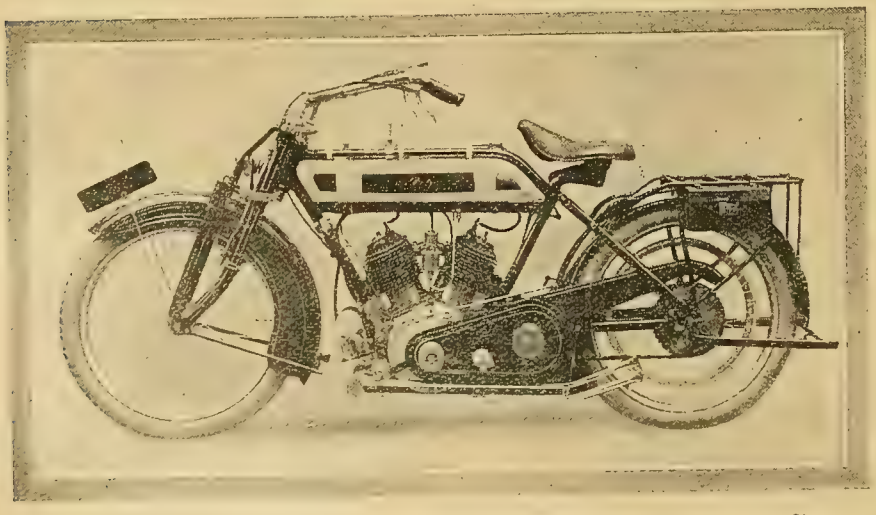


The 4 h.p. water-cooled model here shown is the latest production of the Humber Co.

(1) Front view showing radiators, and the Bramble patent chassisless sidecar, the springs of which are entirely enclosed.

(2) Side view showing the water-jacket, footboards and general arrangement.

Next Year's Twin Dot-Jap.

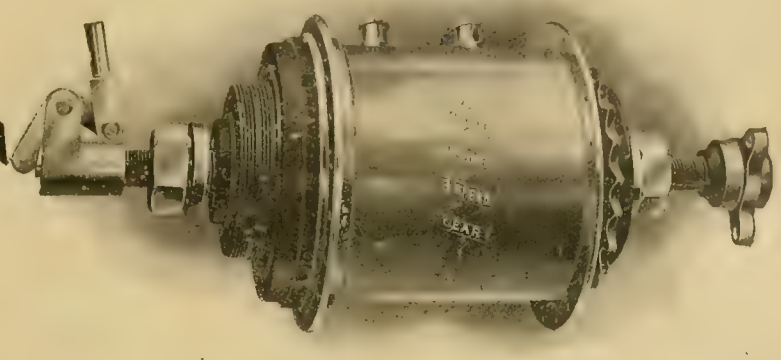


Side view of next year's 7 h.p. Dot with twin J.A.P. engine, countershaft gear, and chain drive. Observe the neat extension pipes from the expansion chamber to the rear.

The new Dot machines as may be imagined, with Mr. Harry Reed at the head of affairs, are ideally practical mounts, and undoubtedly the smartest and most substantial designs which have emerged from the Dot works. The specification is by no means an inflexible one, for Messrs. H. Reed and Co. offer clients the choice of a 6 or 8 h.p. engine, a gear box of the sliding dog clutch type, giving two, three, or even four speeds. A kick starter of neat design is attached to the end of the gear box on the right-hand side, the mechanism being completely enclosed in an aluminium case. The clutch, which has cork inserts, is said to be practically indestructible; a shock absorber is fitted on to the engine shaft.

The silencing arrangement is very praiseworthy. There is no cut-out, the gases first being trapped in an expansion chamber and then conveyed to the rear by a couple of pipes of smaller diameter. The petrol tank is of two gallons capacity, and three-inch tyres are fitted as standard.

The
Motor Cycle Gear for 1914
The Famous



STURMEY-ARCHER

3-Speed & Free Engine Gear

will be fitted by the following firms as a **standard specification** of their 1914 motor cycles—

TRIUMPH
HUMBER
BRADBURY
ROVER
ARIEL
SWIFT
EXCELSIOR
CALCOTT
CAMPION
HOBART BIRD
SUN
JAMES
L.M.C.
A.J.S.
IVY-PRECISION
ROYAL RUBY
VICTORIA

will be fitted by the following firms to their 1914 models, **to order**—

RUDGE-WHITWORTH
PREMIER
SINGER
ALLDAYS & ONIONS
HAZLEWOOD
BROWN
O.K.
RAGLAN
IXION
IMPERIAL
VELOCE
WULFRUNA
QUADRANT
MOTO-REVE

New booklet post free—

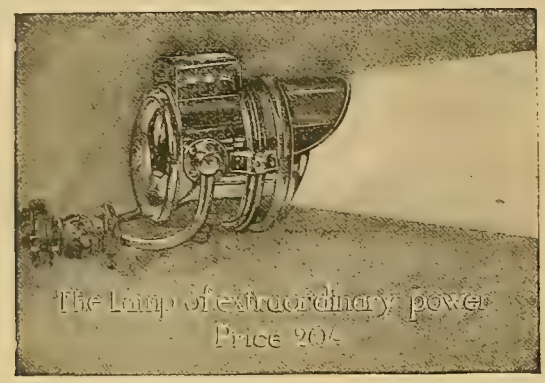
OLYMPIA, STAND 159 (Gallery).



The 'Pharos' Headlight

The 'Pharos' motor cycle headlight is a lamp of exceptional power, and its unique method of construction places it at once in the forefront of anything yet manufactured. The lamp is made of stout gauge metal, heavily nickel-plated. Every joint and attachment is strongly riveted. The reflector is of the lens type and is reinforced by a strong lens which takes the place of the front glass, thus giving a long and powerful beam. The DUNHILL adjustable bracket enables the lamp to be always regulated to the point of maximum advantage.

Price - - - - - 20/-

DUNHILL'S NEW M.C. OILSKINS

Undoubtedly the smartest and most serviceable oilskins on the market are the new Dunhill pattern here illustrated. These oilskins, which consist of a comfortable full jacket and trouser overalls with seat, are made in a new material of dark green colour, and are beautifully soft, flexible, and light in weight. Motor cyclists will find the new oilskins a valuable part of their equipment.

Price 33/6 complete

The 'Lukin' (Patent) Carburetter

(Dunhill's Sole Agents).

The 'LUKIN' has the throttle on the atmospheric side, and NOT on the engine side, thus ensuring a correct proportion of petrol and air before they are mixed. The vacuum in the mixing chamber increases as the throttle is closed, providing a medium for the instant volatilization of the petrol when it is most needed. The 'LUKIN' Carburetter has no tuned jets, but it is tuned for every speed by means of a shaped valve. There is but one moving part. Needles, dash pots, tuned springs, and other delicate mechanisms are entirely dispensed with. Suitable for every make of Motor Cycle. It is a petrol saver, of unique value, and will save its own price in a month. Write for particulars.

Price of Carburetter - - - 55/-

Petrol Consumption.

Sir,—With reference to the letter from Mr. P. W. Hill *re* petrol consumption, I am, as the owner of a 1913 A.C. Sociable, greatly interested to know what was the setting of the B. and B. adjustable jet, which I take it was used, as personally my petrol consumption averages 48 m.p.g.

C. S. SOMERS.

Camaraderie.

Sir,—I wish to mention an incident which occurred lately, and which you might insert in your paper, both as evidence of the courtesy of some of the motor cyclists, and also perhaps a testimony to the power of the Blackburne cycle.

A friend and I were stranded, some six miles outside of Wakefield, owing to sparking plug trouble with a 3½ h.p. cycle and sidecar. Mr. C. Q. Roberts, riding a 3½ h.p. Blackburne cycle and sidecar, very kindly came to our assistance, and being unable to repair the defect towed us, bag and baggage, right into Wakefield without any difficulty or stoppage whatever. The combined weight of my friend and myself is twenty-two stone.

H. OGILVIE.

The Modern Reliability Trial.

Sir,—Your leader on "The Modern Reliability Trial" is of considerable interest, but it does not, if you will pardon my saying so, go to the root of the matter.

A year or more ago, when courses were easier and gold medals cheaper, the opinion was freely expressed that reliability trials were too easy, that they provided no test for the competing machines, and that therefore they had better stop. This year, when courses are stiff and gold medals dear, we are told that the trials are not a good advertisement to the movement. Now what is the unfortunate club secretary to do? He is scored off either way.

Surely it is time to settle what a "reliability trial" really is. Either it is, as its name implies, a test, or it is simply a rather elaborate form of advertising. If the latter, then the sooner its name is changed to something more accurately descriptive the better. If the former, grumblers and strikers will perhaps make a note of the fact.

L. FRANCIS JONES.

[It should not be difficult to avoid going to either extreme. Take, for instance, the recent Midland trial of the Sutton Coldfield Club, which was severe but not freakish.—ED.]

Sir,—I have been very much interested in the articles and correspondence on the question of including or excluding freak hills in trials, and would suggest for the consideration of the A.C.U. that the question of fuel consumption be made to count in the results, and that freak hills be excluded or be optional, as the climbing of them is of no practical value to the ordinary motor cyclist.

We are all satisfied that there are machines on the market which will take one anywhere under certain conditions, but with the price of fuel on the increase it is time something was done to show that it is possible to average twenty miles an hour on give and take roads, including the stiffest climbs on the highways of Great Britain, with a low fuel consumption.

The inclusion of such a test would tend to more attention being given to carburation and the production of fuels other than petrol, both of which matters would be for the economical good of the motoring public.

My present fuel is half each benzole and No. 1 petrol with a two-lever carburetter used automatically, but I am on the look-out for an automatic carburetter which will give a good steady pull in traffic on top gear and tick over when the clutch is taken out.

My motoring experience covers ten years, and averages 7,000 miles a year, chiefly 6 h.p. sidecar, and I have never yet had to stop on a hill or discard a passenger. My roads included Lake District, Wales and Devon, Birdlip, Moretonhampstead, Two Bridges, etc. Self and passenger, 20 to 25 stones. My best averages were: 3½ h.p., with Millford standard sidecar, 85 to 92; 6 h.p., with Millford coach-built sidecar, 60 to 65; both in hilly country.

ECONOMIST.

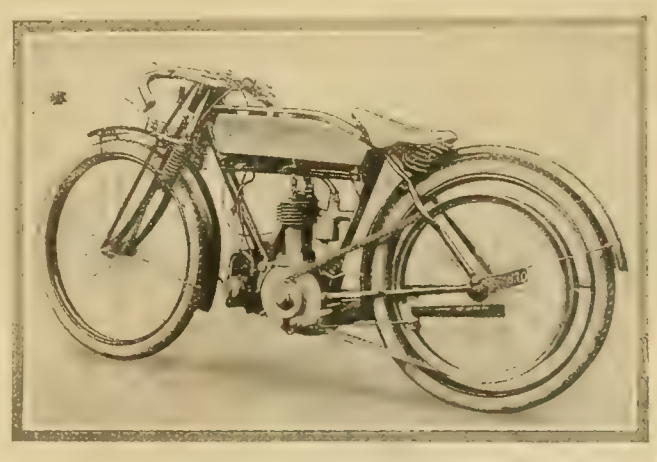
The Use of a By-pass.

Sir,—I notice in a recent issue that several competitors in the Birmingham trial were using the Badcock by-pass. This has prompted me to give my experience with this little device. At the outset let me say I have no interest or connection whatever with the firm, the following being solely for the benefit of your readers. For those who do not desire to go to the expense of one of the latest one-lever type, the by-pass is just the thing, converting, as it does, the two-lever into a purely automatic instrument.

I have found that starting is very easy indeed, consequent upon the very efficient mixture obtained. Once you have gained a proper regulation suitable to your engine a few steps alongside and you hear the gentle tick, tick, so delightful in slow running.

Together with the low cost it is the work of a few minutes to fit, and any of my motoring colleagues with the faintest idea of handling tools can make a job of it. No one will gainsay that the B. and B. carburetter is a really good one, but fitted with the Badcock by-pass it is simply excellent. By experiment you find the correct position for the air lever and it is left there permanently. I have also found a saving in fuel, the by-pass coming into action when the throttle is closed, the acceleration being good when again opened. This alone is a great point with many, but the delightful driving will appeal to all who desire to make a good carburetter into a very much better one.

J. T. DAVISON.



A MODERNISED LIGHTWEIGHT.

The improvements to the above machine which was originally a 1910 model 2½ h.p. A.J.S. were effected at home by the owner, Colin Shirlaw.

Leaking Water Jackets.

Sir,—With regard to "Roundlay's" complaint *re* the clogging up the gauzes on his Scott machine, my experience with benzole on a Scott has been entirely different, the gauzes keeping very much cleaner than when using petrol. I think "Roundlay" will find that the trouble is due to over-lubrication.

I may say I am troubled with a water leakage from the tops of the cylinders of my 1913 Scott. I wrote to the makers, and they recommended a preparation called "Waterite." I tried this, but the cylinder heads leak more than ever. I have also tried to stop the leaks with white lead and also shellac, but without success.

I shall be glad to hear from any of your readers, who have remedied the fault, how the leakage can be stopped.

TWO YEARS AHEAD.

A Strange Experience.

Sir,—I am very thankful for the article, "A Strange Experience," which you published in *The Motor Cycle* of September 18th.

I have a single-cylinder two-seated car which I have been driving for about two and a half years, the magneto of which runs at engine speed. It has always given trouble by knocking when accelerating and climbing, although at other times the engine runs almost as silently as a good four-cylinder engine.

At the beginning of this year I commenced using benzole instead of petrol, which entirely stopped the knocking. About four weeks ago the engine started making a peculiar bumping noise at times as if a nut or some obstacle was on top of the piston, which almost prevented the piston turning over the top centre. Everything which could be thought of was gone into and tried without any benefit. Seeing the article referred to in your paper I at once made a spark gap and fixed it, and the bumping was immediately cured. This appears to be a parallel case to that described in your article.

ROBT. E. SPROTT.

The Power of Sidecar Combinations.

Sir,—As a motor cyclist I need not say that I read practically every scrap of *The Motor Cycle* each week. I notice in the Oct. 9th issue an article on "The Power of Sidecar Combinations," and a very shrewd and well-written article it is. My only fault with it is that it may put off someone who would otherwise take up sidecaring with a 3½ h.p. and three-speed motor cycle, as such a lot of people are afraid of a 5 or 7 h.p. twin, both on account of expense of tyre upkeep and weight, etc. Your article says that for serious touring in the Lakes and Scotland a 6 to 8 h.p. twin is essential. I cannot speak of Scotland, as that is a treat in store, but my wife and I toured the Lakes this summer seriously, and had a glorious time, and, although we carried full luggage and lunch outfits and a rather big outfit of spares, she had not to get out of the sidecar once on account of roads or gradient. Our outfit was a 3½ h.p. Bradbury, Sturmey-Archer three-speed, Canoelet sidecar, 2½in. tyres, extra gallon of petrol, oil, etc., and, as I said before, a full and heavy outfit of spares and luggage.

We went from Southport over Shap, stayed the night at a lovely little place called Crosby Ravensworth, off the main road, and which is approached by a bad zigzag road with a severe gradient. This has, of course, to be climbed coming back. On the second day we did Hawes Water, Ullswater, over Kirkstone to Ambleside, and up past Thirlmere to Keswick, where we expected to stay the night. However, it was full of clerical gentlemen (we never saw so many in our lives before), and we went on to Derwentwater and found a delightful spot called Leathes Cottage, on the way down to the Bowder Stone.

On the third day we went round Bassenthwaite Lake, over Whinlatter Pass to Buttermere and Crummock Water, and had a look at the famous Honister Pass. Back again past Loweswater and to Ennerdale. We stayed the night at the Anglers' Inn, on the shores of Ennerdale Lake, a most charming place to stay at.

Fourth day, from Ennerdale to Seascale, through lovely Eskdale to the most glorious spot in all the Lakes—Wastwater. We got there early, so put up at the Wastwater Hotel, and climbed Great Gable by the Styhead Pass.

Fifth day, from Wastwater, over passes and mountains and by-roads galore to Cartmel Priory, a glorious spot not to be missed, and on to Grange, a rather disappointing place, where we stayed the night.

Sixth day, Grange to Kendal, and home to Southport (spirits at zero). The next week we went from Southport through Lancaster to Ingleton, Settle, Skipton, Grassington, Pateley Bridge (for Fountains Abbey), Ripon, Boroughbridge, to Harrogate. Nothing whatever was done to the machine except to put a little sperm oil into the three-speed gear hub each morning and mend one puncture. So, really, although with a twin perhaps more miles could have been done on top gear, I do not know that it would have been worth the added expense, as we got about quite as fast as we could want; in fact, one wants to stop really every few yards to look again at the ever-changing scenery; and a machine that would crawl without overheating on top gear at about five miles an hour would suit best. However, there it is: we did this holiday without shedding the passenger anywhere, and at such a cheap rate and so little trouble and worry that I, although a mere novice, would advise anyone not to despair of a good 3½ h.p., even with a coachbuilt sidecar. He can with the low gear climb any ordinary precipice in England, and, if not so fast, at any rate quite as safely and satisfactorily as a twin. Of course, I know the Bradbury is a good machine for this work, it has such a good slogging engine; and the steering—well, it is fine. The second gear at about 8 to 1 romps up most hills without any fuss and yet at a decent speed. F.Y.

[The Bradbury has a 554 c.c. engine and develops more than 3½ h.p.—ED.]

A Bull-pup Mechanic.

Sir,—The enclosed photograph shows "Jock" helping his master to clean a sparking plug. Whilst his brothers and sisters are busy chewing up old boots and worn-out covers, "Jock" sits patiently beside the machine, ready at all times to lend a helping hand (or rather mouth).

We all know how annoying it is to find the necessary spanner just out of reach, or on the other side of the machine, when most wanted. A word to the faithful pup, and off he trots to retrieve the necessary article. The only difficulty experienced is to keep him from swallowing it during transit!

A bull pup mechanic.

Occasionally one's pleasure is somewhat marred by opening "Jock's" mouth only to find that the cherished washer has disappeared into some remote portion of his interior. His partiality for the covering of the high-tension wire is also rather a bad fault, and has led to him receiving a mild corrective spanking at times. But, on the whole, he makes splendid company when tuning-up is necessary, and his presence has naturally the effect of modifying one's language after an unsuccessful attempt at grafting skin on to a projecting nut.

GERALD J. EASTBURN.

Leipzig, Germany.

THE BOOK OF THE MOTOR CAR

An indispensable work for every motor cyclist. First payment, 1/6 only.

The Book of the Motor Car is the first really comprehensive work on motor cars, motor cycles, and cycle cars, ever published. By the careful study of its chapters the rawest amateur can learn the principles upon which his car works, but at the same time it is so comprehensive and so striking in its detail that even the skilled expert will find it a book of enthralling interest and extreme utility, while the practical motorist will find it quite indispensable. It should be as much a part of the equipment of a garage as an oil-can or a lifting-jack. Reading its chapters even the most expert driver will find himself gaining a fuller understanding of points that he thought he understood already, and learning hints that will enable him to increase the efficiency of his mount in a surprising manner.

Driving and Repairs.

The Book of the Motor Car is full of invaluable information on all problems of driving and repairing a car, instructions being given for all possible difficulties in language that can be understood, even by the most unmechanical mind. The following are a few of the subjects dealt with :—

Cylinders, valves of all kinds, different types of engines, carburetters, ignition, silencers, gears and clutches, radiators, cooling systems, brakes, lubrication, lighting systems, wheels, tyres, fuels and how to use them (including all the new petrol substitutes), tools, and repair appliances, etc., etc.

Cycle Cars and Motor Cycles.

The work pays full attention to motor cycles and cycle cars, full details and instruction being given for all those points wherein they must be treated differently from the more powerful motor car. In these and all other respects the Book of the Motor Car is absolutely up to date, and in line with the very latest discoveries in motor engineering. It is profusely illustrated with full-page plates, drawings in plan section and elevation, diagrams, and photographs, as well as a series of sectional movable models in colour showing in detail the actual working parts of a car.

Mr. Charles Jarrott writes :

"I think the Book of the Motor Car invaluable. As a book of reference it will be of great value to me, and everyone who is keenly interested in their car should have a copy."

A FREE BOOKLET.

The publishers are willing to send an interesting illustrated booklet describing the work to all sending this form or a postcard.

To the Caxton Publishing Co., Ltd.,
281, Surrey Street, London, W.C.

Please send me, free of charge and without any obligation on my part, your illustrated booklet giving full particulars of the Book of the Motor Car and your offer to deliver the complete work for a first payment of 1/6 only.

THE STRENGTH OF THE L.M.C. for Sidecar work.

The following is a continuation of the series of appreciations which appeared in our last announcement (October 9th, 1913).

"My machine has never needed a tool used on it, and has never caused me a moment's delay, though it is pulling a ten stone passenger and extra heavy luggage."

"I have previously had two machines of good make, and could not manage them to my satisfaction, but the L.M.C. gives me no trouble, and I find a pleasure in motor cycling that I have not previously experienced."
E. E., Hants.

"The machine is still taking the sidecar as well as ever, and is wearing very well. In fact, there is as yet no noticeable wear on the main bearings."
W. D. N., Kirkcaldy.

4 h.p. L.M.C. Countershaft Gear.

"I have now been 1,500 miles and think I know what it is, does, and will do. In the first place it has given no trouble. I think I can sum up its good points as a sidecar machine. (1) It is very comfortable. (2) Quite fast enough. (3) Very sure on hills. (4) There is not the painful crawl with a roaring engine on the low gear on hills as with a less powerful or lower geared engine. (5) The gears are extremely nimble. (6) Many have commented on its silence. (7) Easy starting. I never use the kick-starter, as it starts so easily on low. (8) The decompressor is great."

LATEST SUCCESSES.

Midland Reliability Trial—October 4th.
4 h.p. L.M.C. (L. A. Bees) .. GOLD MEDAL.

Liverpool A.C.C. Trial—September 27th.
4 h.p. L.M.C. (L. A. Bees) .. SILVER MEDAL.

Mr. Bees just missed winning Gold Medal owing to the back wheel slipping on the greasy freak hill. In fact, only two lightweight machines successfully negotiated this climb.

LMC
The Motor Cycle of *PROVED* Greatest Reliability

Need we say more concerning the reliability and efficiency of the L.M.C. except to request you to write for our liberal terms.

Petrol Consumption Tests.

Sir,—As Messrs. P. W. Hill and Howard Smith have offered to repeat their performances it seems curious that the James riders (Messrs. Pollock and Dixon) have not followed suit. I do not doubt their *bona fides*, but I understand that they used different makes of carburetters, and that the filler caps were not sealed. In face of this, and the fact that twins are less economical than singles, does it not strike all as mysterious?

By the way, is it usual to class sidecars and tricars with a Singer car of twice their weight, viz., 15¾ cwts. (weight being a big factor in the formula for merit), as appears to have been done in this trial?

It is with regret I read that such a sportsman as Howard Smith does not agree to using a separate tank, which, I think, is quite fair.

You do not say whether you have asked P. W. Hill, and if he has agreed or otherwise. ALFRED B. COOK.

[We have not specially invited Mr. Hill to agree to our conditions.—ED.]

Benzole.

Sir,—Having read with much interest a letter signed "Petrol," I desire, with your kind permission, to place on record my own experience with the same make of machine.

It was while using my third gallon of benzole that, ascending a hill, my engine suddenly gave out, with a pleasant "rasp."

Expecting to find a broken ring or valve (have not had either previously) I removed the cylinder. Judge of my delight when I found the flywheels revolving independently, connecting rod loose, etc., the result of a broken connecting pin. I am of the opinion that the blame is on the fuel, and not the engine, and my reason for so thinking is that although apparently benzole does not knock as does petrol, the causes of the knocking are there, causing exceptional strains.

In the meantime benzole is "off" for. A.F.W.

[We can only say that we have used dozens of gallons of benzole in the same engine with no noticeable ill effects.—ED.]

An Undesirable Practice.

Sir,—Having seen three young women lying on the roadside insensible and badly injured this season, and the inquest on another from pillion riding, allow me to add a protest on behalf of the ignorant. G. T. LANGRIDGE.

Sir,—I have been much interested in the recent correspondence in your columns with regard to the dangers of carrier riding. It seems to me, however, to be purely a matter of conditions. If the machine is one of the ultra-modern type, with steel tube carrier, free engine, and change speed gear, and is carefully driven by one who is thoroughly accustomed to all the controls and fully understands his machine, I can see little or no danger, always supposing that there is no chance of side-slip through wet weather.

The fact that some of the chief insurance companies allow carrier riding without extra charge rather points to my contention.

It is when one sees a hopeless novice or tyro (usually of the type that turns his cap round the wrong way) careering along the road on a single-geared crock in the last stages of dissolution that one may expect accidents such as your correspondent "Maxime" describes.

I have done a good deal of carrier riding on my 2½ h.p. chain drive A.J.S., and the fact that I have never had a single road stop of any description bar four punctures in 5,000 miles seems to show that even well-built lightweights are not unsuitable for occasional jaunts if used with care.

With reference to "Ixion's" search for an ideal enclosed speedometer drive, might it not be a further point in favour of counter-shaft gears if it were possible to attach the drive to some portion of the gear box mechanism. B L 2318.

Hub and Counter-shaft Gears.

Sir,—In reference to the letter from "U 6652," I have had a Triumph and Sturmey-Archer gear for some months, and must confess to some trouble with clutch-slip, but this was due to unsuitable oil, and to my novitiate at the sport. I have now had six pairs of new plates mounted, and further, the Triumph people very kindly sent me a new clutch pedal, which causes the triangular cap on the back wheel spindle to move over a larger arc. I take it that the experience of one who has had trouble is of greater service than that of one who has not. The following tips are vital to efficiency:

(a) Use only sperm oil, injecting liberally with engine running, low gear, and clutch out.

(b) After long dirty ride, flush with paraffin and re-lubricate.

(c) Keep clutch engaged when machine is put to bed.

Neglect of *a* and *b* means scoring the plates, while neglect of *c* inevitably weakens the body springs. Now that I rigidly adhere to these matters I have no vestige of slip. My old plates were very badly scored, and my clutch probably slowly slipped at the smallest provocation. The use of thick oil is fatal, as then any chance grit refuses to emerge, even with drastic paraffin treatment.

I admit the running mount with sidecar whenever possible, and this will certainly retard depreciation, but, like "U 6652," I think the advice to use the clutch as little as possible is absurd; yet I am sure the dodge of purposely slipping the clutch to hold on to high gear under stress of gradient is asking for eventual trouble.

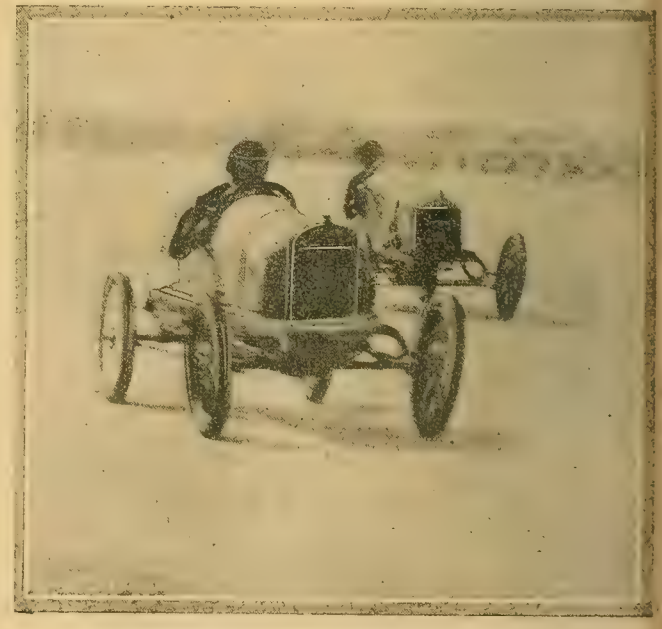
PHILIP H. WILLIAMS, F.C.A.

The Price of Motor Cycles

Sir,—Your correspondent, "Utilitas," does not, I think, fully apreciate my previous letter to you. He rather wanders from the point in suggesting that it follows that, with reduction of prices, quality must depreciate as well. This must not be taken for granted, and Messrs. Humber, Ltd., or, as far as that goes, any good firm, who are enterprising enough to lower their prices, can, I am certain, be trusted not to lower their reputation by filling the market with "trash." They are not likely to fall behind in the matter of improvements, even in the event of a reduction in prices.

Another point is that I am not one of the "old expert riders" or "racing men," but hoping shortly to be merely an amateur motor cyclist, and not having any money to throw away where it can be saved, I do greatly appreciate Messrs. Humber's action.

In conclusion, and replying to "Utilitas's" last paragraph, I feel perfectly confident that all manufacturing firms can look after themselves in the way of profits and also in the way of reputation. The suggestion of "reducing prices by a few pounds," which "Utilitas" treats with such scorn and contempt, is one which, I feel sure, will be universally appreciated by all intending motor cyclists and certainly by myself. G. GORDON G. FRANCIS.



SATURDAY'S B.M.C.R.C. BROOKLANDS MEETING.

G. W. Hands (10 h.p. Calthorpe) and B. Haywood (10 h.p. Singer) who had a long tussle in the hour race; the Singer proving victorious.

Half-day Trial of the Single Gear Club.

The Shortcomings of Single Gears demonstrated as well as their Efficiency.

THE first trial promoted by this club was held last Saturday over a very sporting course in Kent. The start took place at 2 p.m. and attracted forty-two entries. The rules of this club state that a single gear only will be allowed, but this does not bar machines fitted with speed gears, as it will be permissible to fix the gear and seal the operating lever so that it cannot be used. Leaving Leaves Green, the first hill, and probably the worst in the whole trial, proved to be Cudham Church with its right-hand bend. Here Greene-Nolan (Triumph), Lloyd (Rudge), Chapman (Rover), Bedford (Bat), and Dussuck (Triumph) all failed, while Pinfold (Bradbury) reached the top by foot-slogging, and Brown (Crouch-Jap) charged the bank and came to a standstill. A country lane now brought us to Titsey Hill, but instead of getting a fair run at it the competitors arrived on the stiffest part from a by-lane. Here many came to grief, including Brittain (Triumph), Greene-Nolan (Triumph), Breese (B.S.A.), Brown (Crouch-Jap), Penfold (Bradbury), Graham Price (P.V.-Jap), Bedford (Bat), Kerr (N.S.U.), while Abbott (Bradbury) ran, and Dussuck (Triumph) foot-slogged. A moderately good road led to Polsteeple, and the performances were as follows: Low (Matchless sc.) stopped near top, Greene-Nolan (Triumph) failed, A. G. Roberts (Blacburne), Veacock (Premier), Chapman (Rover), Graham Price (P.V.-Jap) only just reached the summit, but Stocker (Rudge), Eley (Bradbury), Selby (Motosacoche), Gibson (Enfield), Wood (Enfield), Brown (Triumph), Hood-Barrs (Triumph), Brough (6 Brough), and Rex Mundy (Triumph) all made splendid ascents.

L. V. Veacock (3½ h.p. Premier) starting in the trial for single geared machines. Harold Karslake is seen on the right with the watch.

Timed Ascent of Brasted.

The next hill, Brasted, was a timed climb to decide the winner of the cup. A lane brought us suddenly on to the hill where the timekeeper was standing. Many of the men did not understand that the timing would commence here, so, of course, lost much valuable time before getting up speed. In addition to this the hill was crowded with spectators, both mounted and unmounted, who baulked the riders and would not listen to the marshals. This state of things naturally caused a lot of trouble after the trial.

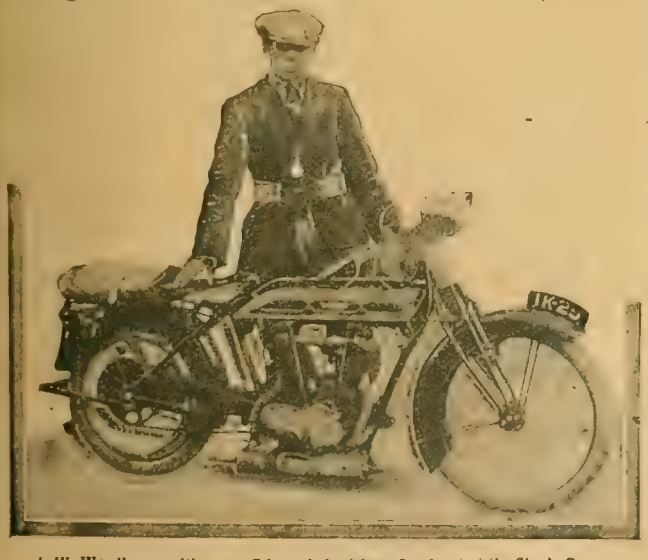
Toys Hill proved easy work for nearly all the competitors, and Titsey, which again had to be climbed, was approached from the foot, where a good start could be obtained. Here, however, a constable stopped two men for riding to the common danger. Polsteeple was again climbed, but nearly everyone knew it this time and made clean ascents.

All was now plain sailing to the finish, Leaves Green, where Harold Karslake timed the men in. A committee meeting was held after the trial to decide the winners, and a protest was handed in with reference to Brasted Hill. After much discussion it was decided that, owing to unforeseen difficulties and baulking by unsportsmanlike spectators in the timed hill-climb, the cup, also gold and silver medals, be not awarded, but kept for a future occasion, and that the only award be a bronze medal to all those qualifying for one on hills, non-stop sections, and times of finishing. This appeared to be the only satisfactory way of dealing with the matter, though the resolution was arrived at after having worked out the results.

The following qualify for bronze medals, having made non-stop runs over all non-stop sections and finished within five minutes either side of schedule time: F. L. Bassett (3½ Triumph), R. Croucher (3½ Kerry-Abingdon), C. W. Meredith (3½ Bradbury), F. G. Kennard (5-6 Matchless), T. Silver (3½ Quadrant), G. S. Davison (3½ Rudge), F. G. Stocker (3½ Rudge), R. E. Eley (3½ Bradbury), B. F. A. Fowke (3½ Blackburne), A. F. Selby (3½ Motosacoche), S. W. Gibson (8 Enfield), J. W. Wood (8 Enfield), T. A. S. Brown (3½ Triumph), L. V. Veacock (3½ Premier), H. R. Hood-Barrs (3½ Triumph), G. Brough (6 Brough), Rex G. Mundy (T.T. Triumph), H. Crouch (8 Horley), and G. Crouch (5 Horley).

J. Woodhouse was disqualified for leaving the route and F. W. Applebee owing to clutch slipping.

It is unfortunate that the first trial promoted by this club should have such dire results.



J. W. Woodhouse with a new 7 h.p. chain-driven Quadrant at the Single Gear Club's trial on Saturday.

NORTON IMPROVEMENTS.

The principal alterations to Norton machines for 1914 are in connection with the engine design and the further development of a passenger model. A special Brooklands pattern at £60, stripped for racing, will be marketed, and accompanying each of these selected machines will be a B.M.C.R.C. certificate showing that the machine has lapped at Brooklands at a speed in excess of 65 m.p.h. The 4 h.p. standard solo mount will be sold with three-speed S.A. hub gear, and the passenger model with three-speed counter-shaft gear. The engine improvements consist of a cleaner crank case casting with the timing gear bushes and tappet guides inside instead of outside, thus leaving a flush side and top to the timing case. The cylinders have been redesigned so that the cooling should be uniform throughout.

Ben Lomond climbed by Motor Cycle.

A Task which occupied Three Days.

AFTER the ascent of Ben Nevis by motor cycle and sidecar, it was only natural to expect that Ben Lomond would fall to the scalp-hunting propensities of the motor cyclist. It is rather curious that riders are willing to knock their machines about to such an extent in climbing over boulder-strewn tracks, for motor cycles were never intended as mountain-climbers.

Early last week a small party of enthusiasts left the outskirts of Glasgow, and, after an uneventful journey, were soon at the Rowardennan Hotel, the centre of operations. Two of the members, W. B. Cramb and T. Walkinshaw, the former riding a 3½ h.p. Elswick and the latter a 3 h.p. twin N.S.U., were bent on the conquering of Ben Lomond, and after some minor adjustments were soon tackling the grassy slopes of the base.

The track leading to the top of the mountain was, at the start, of fairly respectable surface, but afterwards developed into the dry rock strewn bed of one of the many torrents which leap down the mountain side in the rainy season. Progress was naturally slow, and falls fairly frequent. Cramb was particularly unfortunate in this respect, for he and his machine turned a complete somersault into the bracken at the side of the track. The toss was due to a very severe back wheel skid, which swung the rider right off the track. The accident was not without its humorous side, however, as all that could be seen of rider and machine were two feet projecting above the bracken.

The N.S.U. rider had also not far to seek for his troubles, and had several narrow escapes of coming to grief. Slowly but surely the two climbers ascended nearer their goal, but, after having covered about a mile, darkness compelled a halt until the morrow.

One Rider Disabled.

The Elswick and its rider had not been long at work on the following morning before another awkward toss disabled the latter, his shoulder coming into violent contact with the ground, and he wisely desisted from his attempt.

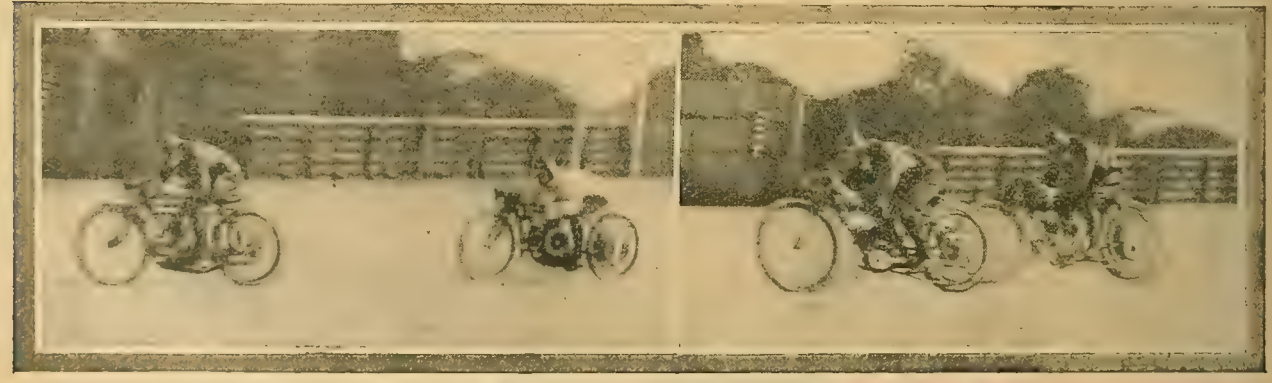
MORE FREAK HILL CLIMBING.

Nearly half way up Ben Lomond, an ascent of which was made by J. Walkinshaw on a 3 h.p. N.S.U. Loch Lomond is seen in the background.

Up to this point the machine gave no trouble, and the steepest of the gradient was easily surmounted on the low gear.

Walkinshaw and his N.S.U. were now left alone to battle with the ascent, and, despite numerous difficulties, fairly rapid progress was made to the summit. Up to the first of the cairns, which is about the half-way point, the climb stiffened perceptibly, and the rider took to the grassy slopes of the mountain in preference to continuing over the boulder strewn path. Shortly after the cairn had been passed, it was decided to rest again for the night.

The next morning the ascent was made on foot, and it was about 10 o'clock when the point where the N.S.U. had been left the previous night was reached. The rider's task was, however, now within measurable distance of completion. About a mile away could be seen the last rise of the mountain, but before this was reached, the intervening ridge had to be conquered. This, however, was not as severe as it appeared, and was quickly covered, despite many hair-raising swerves. Good progress was made to the well, about a quarter of a mile from the summit, but this last bit was the most severe of the whole climb. In addition to fearful surface there was the ever present danger of a fall down the mountain side, and at one place the path is in near proximity to a precipice which falls practically sheer to the valley beneath. The gradient was approximately 1 in 3, and hairpin bends were fairly frequent. Up this rather terrifying portion, the rider made good progress, and in the early afternoon succeeded in reaching the summit. The mist, which had held off during the major portion of the climb, now descended, completely blocking out the surrounding view. The descent was commenced immediately and occupied about 2½ hours, the bottom being reached without mishap. The machine which Mr. Walkinshaw used was a 3 h.p. twin N.S.U. of last year's make, fitted with the makers' two-speed gear. During the whole of the trying ordeal no trouble was experienced, the engine in particular being in excellent fettle, and on the journey home to Glasgow the machine led the way in fine style.



Spectators at Brooklands on Saturday were treated to a number of exciting duels such as the above photographs show. LEFT: C. Williams (A.J.S.) and A. H. Alexander (2¾ Douglas). RIGHT: F. G. Edmond (Humber) and Hugh Mason (N.U.T.)

Club News

Cape Peninsula M.C.C.

A fault-finding competition took place last month. The winner found the fault in his machine, and rode 200 yards in one and a half minutes. Results: 1, J. Ockleford (Rudge); 2, D. Lynch (Humber); 3, A. Furness (Humber); 4, H. Becker (Triumph).

Middlesex M.C.C.

A one day reliability trial was held last week for the Mills Cup over a fairly stiff course. The cup and medal winners were as follows: Mills Cup, D. H. Noble (Rover); silver medals, E. A. Colliver (Indian), J. A. Hilger (Douglas), V. Garland (Chater-Lea sc.), G. Nott (Clyno sc.), and P. Dangerfield (Douglas), *hors concours*.

South Birmingham M.C.C.

The result of the novices' trial, held recently, is as follows: 1, T. Stevens (3½ James sc.); 2, F. W. Merrick (6 Enfield sc.); 3, T. Cooper (6 Enfield sc.); special non-stop medal, H. Warden (4 L.M.C.). Splendid weather prevailed throughout the trial, which included such famous hills as Sunrising, Edge, and Warmington.

Single Gear M.C.

The club is being formed with the idea of catering for that class of rider who does not favour speed gears, and to whom the present day trials with their freak hills and split second timing do not appeal.

Reliability trials, hill-climbs, etc., will be run on somewhat similar lines to the old sporting events, which were so popular before the advent of speed gears necessitated the inclusion of freak hills and badly surfaced roads. Hon. sec., Mr. H. A. Cooper, 206, Algernon Road, Lewisham, S.E

Lincolnshire A.C. (Motor Cycle Section).

A reliability trial took place on the 11th inst., over a very difficult course. Each competitor was allotted 100 points at the start. The results are as follows:

Solo machines.—1, W. Copley (6 Rex), 88; 2, J. E. Harston (6 Campion), 78; 3, A. O. J. Readhead (3½ Rudge), 70.

Sidecar machines.—1, Dr. H. J. Smith (3½ Rover sc.), 69; 2, J. Parr (3½ B.S.A. sc).

Herts A. and Ae. C.

A members' half-day reliability trial for the New Hudson Cup will take place on November 8th over a stiff course containing several good hills.

Merthyr M.C.

The result of the recent reliability trial was as follows: Gold medal, Cled Lewis (6 Zenith); silver medal, L. Pearson (3½ Excelsior); bronze medal, Cromwell Lewis (10-12 Swift).

Bristol M.C.C.

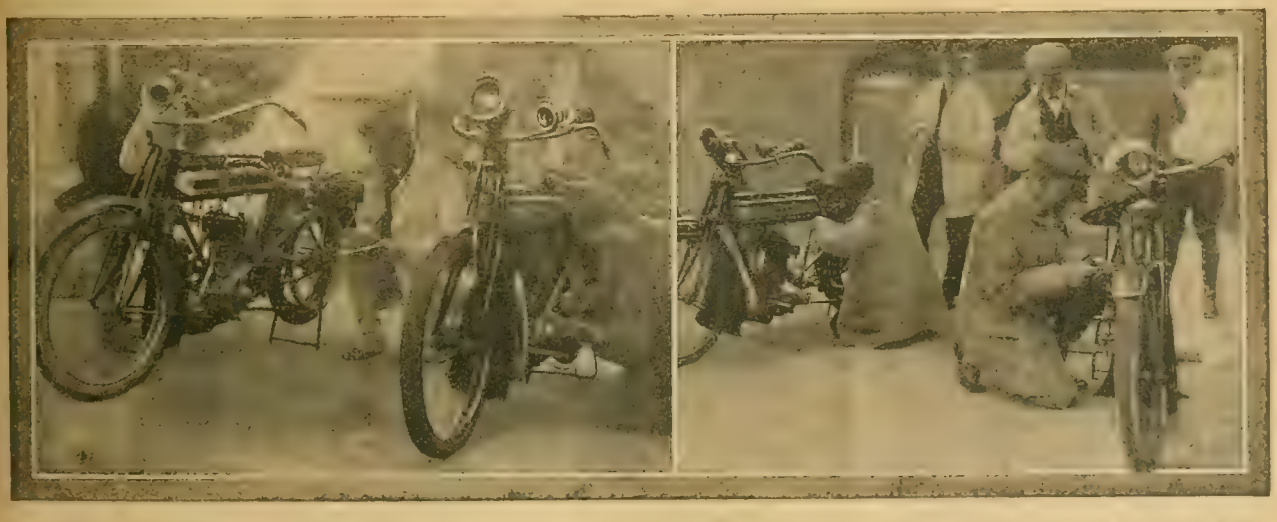
An open twenty-four-hour trial is being organised for the Christmas holidays to Land's End and back on somewhat novel lines. Twenty-three club members have already sent in their names as entrants. For all information, apply to Mr. P. Grout, Warmley, near Bristol.

Leeds M.C.C.s (combined).

On Saturday last the whole of the Leeds motor cycle clubs combined to enjoy a final gathering for the year. Invitations were sent out to adjoining clubs, and eventually over seventy vehicles made the journey to a little village called Monk Fryston, where members of the joint clubs and their friends were permitted by the Rev. B. Hemsworth to wander in the grand park and grounds of Monk Fryston Hall, and also to view the splendid collection of animals and birds located in over one hundred cages close by the Hall. Mr. Harry Moore, a member of the Leeds and Doncaster Clubs, won the prize for the smartest turnout—a 3½ P. and M. and sidecar enamelled light blue grey. The Harrogate Club won the prize for the biggest mileage. Mr. Stuart White was hon. sec. for the event.

"THE MOTOR CYCLE" DIARY.

Oct. 25th.—Finsbury Park C.C. (Motor Cycle Section). Closing run to Radlett.
,, Coventry and Warwickshire M.C. Closing run.
,, Birmingham M.C.C. Closing run.
,, Middlesex M.C.C. Closing run.
,, Streatham and District M.C.C. Closing run to Godstone and club supper.
,, Walthamstow M.C. Competition.



TRACING TROUBLES. A competition which is quite good sport in the winter months, and which we recommend to motor cycle clubs, is one for fault finding. The above photographs, which were taken during a competition held recently by the Cape Peninsula M.C.C., show (1) Behind the scenes, "doctoring" the machines before the start. (2) J. Ockleford (3½ h.p. Rudge) and E. Campion (3½ h.p. Triumph) at work on their machines under the eyes of the timekeeper.

French Motor Cycles and Cycle Cars.

Position of the Industry in France as evidenced by the Paris Salon.

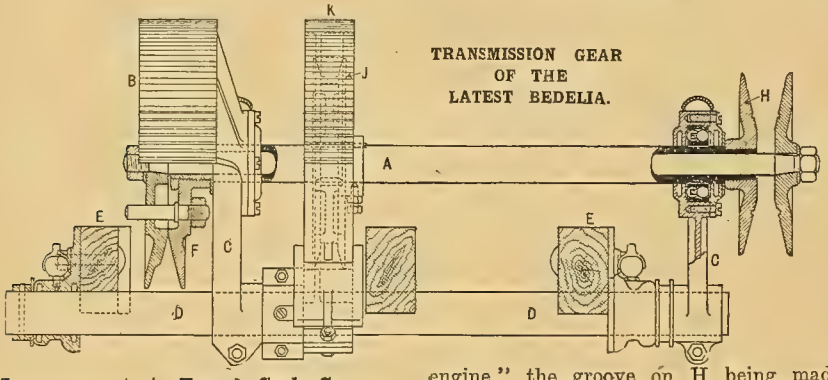
THE cycle car manufacturers in Paris and neighbourhood are making very few alterations to their 1913 models, and, from what we have gleaned from an inspection of the exhibits at the Paris Salon, which opened on the 17th inst., and a visit to the different motor cycle and cycle car factories in the neighbourhood of the Seine, there is very little with which our readers are not already fully acquainted. The position so far as cycle cars are concerned is very much the same in Paris as at home. The French manufacturer, speaking generally, considers the true cycle car is a tandem-seated vehicle like the Bedelia and Automobilette, and the moment side by side seats are employed it becomes a voiturette, and is usually over the chassis weight of 6 cwts, even if the engine comes within the 1,100 c.c. definition. No large manufacturer in France has tackled the cycle car question seriously. We refer to firms like Clément-Bayard and Peugeot. The latter firm introduced the Baby Peugeot this time last year, but it is not regarded in France as a cycle car, although the English definition would admit it. Those French makers who interest themselves in a four-wheeler on motor cycle lines are mostly small firms who have not the inclination or facilities to make the whole of the chassis and engine themselves, but have a fairly good range of tools for assembling purposes, and buy many of the component parts.

The tendency for 1914 among the makers of tandem cycle cars like the Bedelia and Super, both of which are sold in England, is to simplify the construction and adhere to all belt, chain and belt, or cardan and belt transmission. The friction drive is popular for small two-seated side by side machines, and with this type there is a tendency to increase the number of cylinders to four. In England we are accustomed to see all new models at Olympia. In Paris in many cases we were informed that the newest models would not be on the market until January.

As regards motor cycles, the French have still a lot to learn in the manufacture of a really practical machine, though the engines are often very taking examples. English ideas in the matter of fittings are more than ever adopted on the latest French designs.

Many British-made motor cycles are staged (including one or two new models), the home-produced motor cycle now having a big hold in France. Belgian, Swiss, Italian, and Dutch machines are also among the exhibits.

A DESCRIPTION OF THE MORE INTERESTING EXHIBITS.



TRANSMISSION GEAR OF THE LATEST BEDELIA.

Improvements to French Cycle Cars.

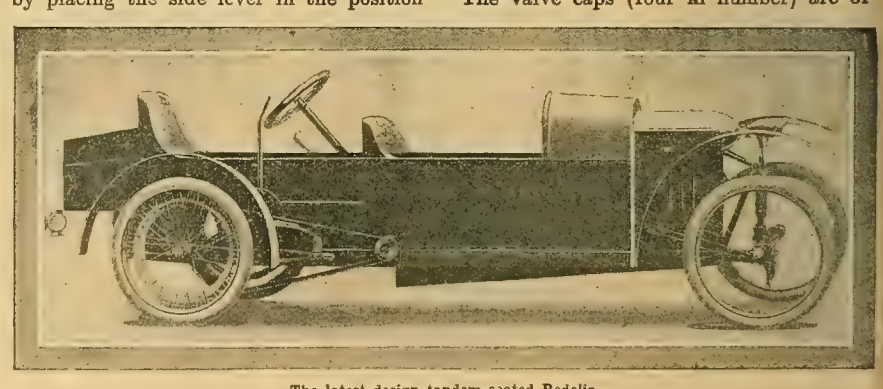
Taking the Bedelia first, as it was the earliest machine of its type, M. Bourbeau pointed out to us his 4 h.p. model for the British motor cyclist who does not care for a sidecar and wants better protection for the driver than is provided by a motor bicycle. It has been designed to suit a low-powered engine, where pure speed is not the desideratum. The principal alteration lies in the control and transmission. On this model the whole of the transmission is by belts, the first drive being by a Whittle leather belt from a fixed pulley on the engine-shaft to an expanding pulley on a rocking counter-shaft A carried on brackets C provided with ball bearings, and pivoted to a cross tube D bolted to the wood chassis members. The rocking shaft E carries two expanding pulleys, one, F, taking the drive from the engine, and the other, H, transmitting it to the rear wheel. These open and close automatically with the pull of the engine, but there is a pedal control of the rocking shaft, which enables the gear ratio to be instantly lowered to zero and again brought back to the original gear. The drawing shows how the fixed flanges of pulleys F and H are attached to the hollow part of the rocking shaft, and the movable flanges to a solid shaft sliding inside the hollow one. Our illustration of the rocking shaft shows the pulleys in the position of "free engine," the groove on H being made to allow the Whittle belt to slip. The gear is lowered by pressing down the pedal B, which is directly attached to the shaft, and in traffic the foot is kept on B ready to bring the free engine into play. Letting up the pedal B gradually against the pull of a spring causes F to expand, and the drive is taken up gradually. When on the open road the pedal B can be left alone, and the usual Bedelia side lever holds the rear axle in the desired position to obtain any one of four or five ratios which are marked on a quadrant against which the lever works.

To start, the free engine is obtained by placing the side lever in the position which is equivalent to holding down the pedal B to its fullest extent. The engine can then be started by a device which consists of a steel cable wound round a big diameter drum permanently fixed on the engine-shaft, and provided with a clutch which throws it out of gear and a spring which rewinds the cable the moment the engine starts running. The handle by which the cable is pulled out is situate at the front of the vehicle, and is in permanent attachment, always ready for use. It does not have to be carried loose, like the top-spinning affair used on the other Bedelia models.

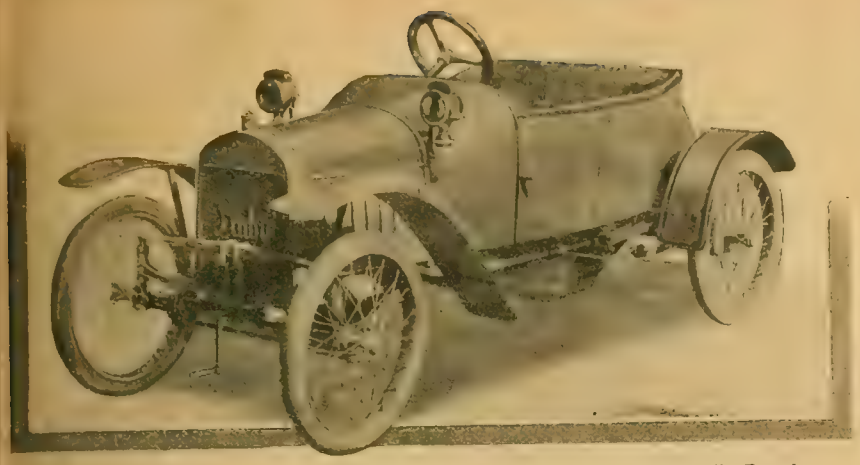
A simple form of counter-shaft brake is fitted on the rocking shaft, consisting of a V pulley J (shown dotted) and a pedal K pivoted on shaft D, and provided with a V band which engages with the groove.

The Tweenie Car.

The same firm who make the Super also make the Tweenie car sold by Jozot and Co., 59-61, New Oxford St., W. Next year this will be fitted with a little four-cylinder engine of 55 × 95 mm., 904 c.c. We saw the designs for this, and, when completed, it will be one of the smallest four-cylinder engines on the market. All the valves are operated by a single camshaft which is gear-driven. The two-bearing crankshaft runs in double ball bearings of large diameter. The valve caps (four in number) are of



The latest design tandem-seated Bedelia.



The 8 h.p. water-cooled Ruby—a French built machine—which is sold in England as the Tweenie.

large diameter, and each cap covers a pair of valves; by this arrangement the cylinders are very close together—in fact, the walls touch each other. This little engine is designed to give 10 h.p. at 2,500 to 3,000 revs. per minute.

The Super Tandem.

The Super tandem (sold in this country by Jozot, Ltd.) now has a cardan-shaft drive to the cross-shaft instead of a chain. This consists of a steel propeller-shaft running inside a tube, and connected to the engine by a universal joint at the one end and to the cross-shaft at the other extremity by a bevel gear which drives the cross-shaft on which is the variable pulley. The gear is covered by a neat aluminium case, and the shaft runs in ball bearings; there is also a thrust ball bearing behind the bevel pinion. Handle starting is fitted to the front of the engine. The weight of this vehicle with two seats does not exceed 4½ cwts.

Impressions of French Motor Cycles.

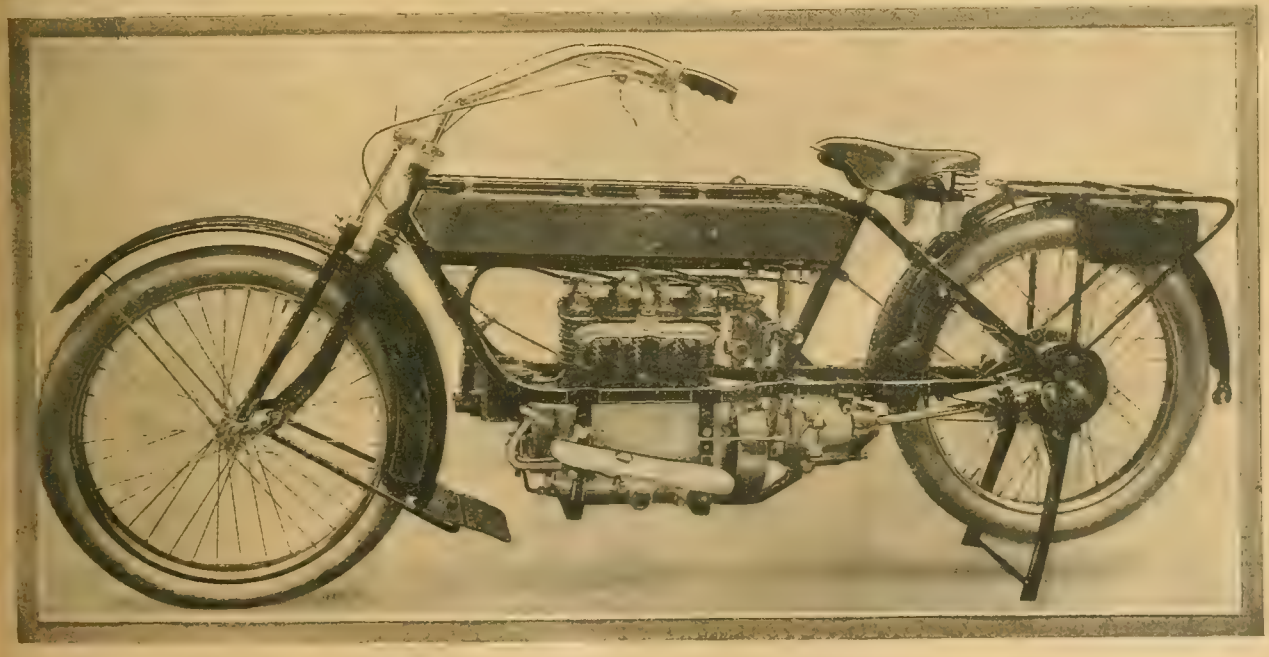
On the whole, French motor cycles are steadily improving, though, in some cases, fittings are very poor and there are too many bent frame tubes. A great many machines are fitted with band brakes on the rear hub instead of front wheel brakes. The band brakes are much too small to be of any serious use. English machines are being extensively copied, and English fittings are becoming more and more common. Several well-known British machines were on view, and in a few cases 1914 models were exhibited. Below will be found a general description of the more interesting machines. No attempt has been made to deal with every stand, as, on inspection, it was found that many exhibits differed only in name and were identical in construction. In a few other cases models are well-known and remain unchanged. Sidecars are increasing greatly in popularity, and though many of those exhibited were of well-known English makes, several good French designs were to be seen. It is interesting to note that the boat body, so prominent among the cars, has spread to sidecars.

F.N.—Entirely New Four-cyl. Model.

The latest single-cylinder F.N. has recently been fully described in *The Motor Cycle*, but a very smart four-cylinder mount of entirely new design was staged. This machine has four cylinders of 52×88 mm. bore and stroke, giving a capacity of 748 c.c. The new engine has mechanically-operated inlet valves on the near side, while the exhaust valves are on the off side, the gases passing out into a single pipe, from which the rider's clothes are protected by a neat guard.

Oil is drawn from a sump below the crank case and forced by a pump through the crankshaft to all the main bearings. A gear wheel indicator shows if the circulation is correct, and if more oil is needed it is only necessary to turn on a tap from the tank. A much heavier flywheel is fitted, and through a disc clutch drives a three-speed sliding gear box in the counter-shaft. The three-speed gear box affords gear ratios as follows: First speed, 11 to 1; second speed, 7 to 1; third speed, 4.5 to 1. The change speed is worked by a lever at the side as in the present four-cylinder, working on a quadrant with a spring ball stop engaging with depressions in the side of the quadrant. There are five positions for this, namely, low gear, neutral, medium gear, neutral, high gear. In changing gear on this machine it is advisable to use the foot clutch lever. A clutch stop has been fitted to the clutch. The final drive is, as usual, by cardan-shaft, but the arrangement has been greatly improved and is very neat. In front of the engine is mounted a segment and pinion kick starting device.

The spring forks are on the lines of those used on the 2½ h.p. model, and are



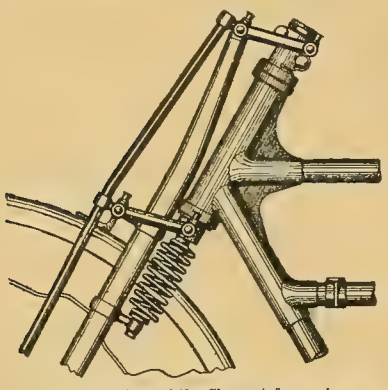
Transmission side of the 1914 model 8 h.p. three-speed four-cylinder F.N

French Motor Cycles and Cycle Cars.—

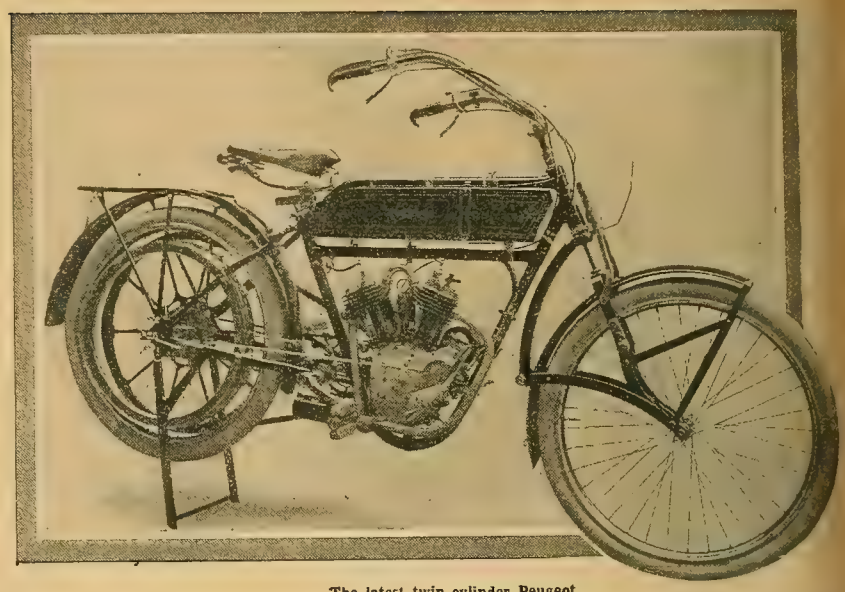
very neat in appearance. The gears may be inspected by merely removing a cap held in position by a leaf spring. All the details are well carried out, and no machine will be supplied without an efficient silencer. The new four-cylinder F.N. forms one of the most interesting features of the motor cycle section of the Show. The frame has been designed for fitting a sidecar. The wheelbase of the machine is 5ft. 1in., while an excellently large tank, holding two gallons of petrol, is fitted. The price of the machine is £78.

Clement.

One of the most successful French machines is the Clément, which is built very much on English lines. An M.A.G. engine is fitted and a chain drive with selective clutch two-speed on the lines of the Enfield. A considerably improved head lug is used on the new models, and snap-down filler caps, internal V rear brake, detachable carrier and rear mudguard, and larger rear chain are all innovations for 1914. Greame Fenton's victorious racer is on the stand.



The front portion of the Clement frame is now now made in one piece, with the steering socket as shown.



The latest twin-cylinder Peugeot.

Alldays.

The feature of this exhibit is undoubtedly the big twin-cylinder model, fitted with a chain drive, two-speed gear, and kick starter in the counter-shaft. The valve gear is protected by aluminium cover plates, and the magneto lies behind the engine. Saxon forks are employed, and the engine is lubricated by a Best and Lloyd sight feed device.

A similar model is shown with a single-cylinder engine. Both machines are fitted with footboards, and have a most businesslike appearance.

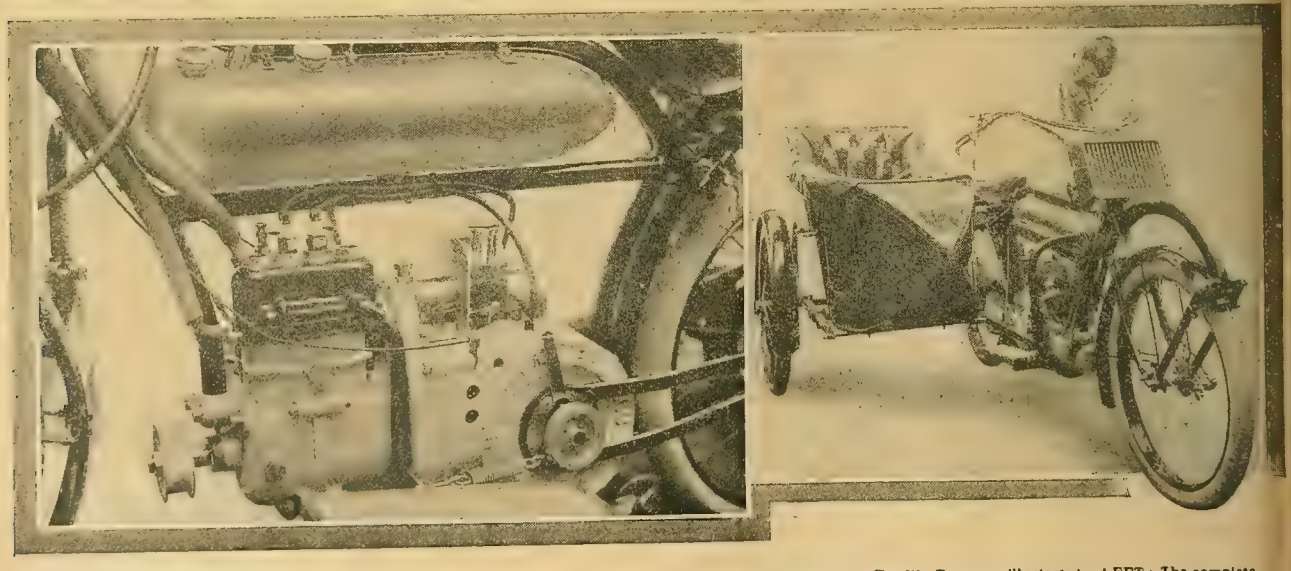
A Friction-driven Vehicle.

The Violet-Bogey friction-driven two-seater, which won two first prizes in its class at Gaillon hill-climb on the 6th inst., will be fitted with a four-cylinder engine in 1914. It is shown at the Salon with the standard two-cylinder engine.

The Ronteix, with gear and chain transmission, which did so well in the Grand Prix cycle car race, has had its four-cylinder engine increased from 62 × 80 mm., 964 c.c., to 60 × 100 mm., 1,132 c.c., which will bring it a little over the limit. This machine is sold in England as the Cummikar.

The Latest Model Moto-Reve.

Two new models of this well-known make are on view, a 3 h.p. and a 4 h.p., for solo or sidecar work. The design has been completely altered. The top tube is dropped at the rear, a counter-shaft type of gear is fitted in which the gear wheels are always in mesh, and the clutch is of the cone type, faced with fibre, fixed on the engine-shaft and



An ingenious, and one of the most praiseworthy of French designs at the Salon is the 3 h.p. twin-cylinder **Hurdtle-Bruneau**, illustrated. **LEFT**: The complete power unit, showing water jackets and twin chain stays. **RIGHT**: The complete sidecar combination. Observe the spring forks and radiator carried up close to the handle-bars.

French Motor Cycles and Cycle Cars.—

mounted on ball bearings. A thrust bearing is fixed inside the engine to prevent side thrust. The clutch is operated by lever on the handle-bar. The chain from engine to gear box is entirely enclosed in an aluminium case. The final drive is by belt, and there is a shock absorber in the rear hub. A foot starter is fitted, and footboards in the form of "skis." The back wheel is easily detachable merely by undoing a nut and withdrawing the spindle.

Chartier-Desvarennes.

On the stand under the above name we found a fine display of Indian models, a make which is in great demand in France. There were, however, no notable deviations from the design of the standard models.

Ajax.

What is regarded as one of the sensations of the Paris Salon is the Ajax four-cylinder friction-driven cycle car, which we described in detail a fortnight ago. The design of the vehicle itself, it may be remembered, possesses no really startling feature. It is its low price which commands one's attention. The cylinders and top portion of the crank case are cast together in one piece, the bore and stroke of the cylinders being 57×96 mm. Detachable wheels are included in the equipment of this car, which is to sell at under £100. It is being handled by Messrs. Briscoe Bros., who are Americans, but the car is being made in France, the engine being the product of one of the largest car manufacturers in that country.

Douglas.

The Douglas and Williamson machines made a most imposing display, most of the former being of the popular T.T. type, though tourist and ladies' mounts were shown. The Williamson has a roomy sidecar attached.

The Baby Peugeot.

The Baby Peugeot, which was exhibited at the Olympia Car Show last year, has undergone one alteration only, that improvement being the addition of a third speed forward, the original model having only two forward speeds and a reverse. It was described and illustrated in detail in *The Motor Cycle* of October 31st, 1912.

Alcyon.

The Alcyon models remain almost unaltered. The little machine is already well-known in England, and is well finished and soundly built throughout.

B.S.A.

A wide range of the well-known B.S.A. motor cycles is staged with either chain or belt drive and the hub two-speed gear. This make has earned itself an excellent name in France by its fine performances on the road.

Rene Gillet.

The twin 64 mm. × 77 mm. René Gillet is fitted with a metal cone clutch and enclosed chain drive to a two-speed counter-shaft gear. In some cases the magneto is carried in the tank and driven by a vertical shaft, but one machine was shown with a platform cast with the crank case on which the magneto is carried.

Swift.

A standard model 3½ h.p. Swift is shown, and is, unfortunately, not displayed in a very conspicuous position.

Triumph.

The single-cylinder Triumphs at the Salon are practically 1914 models of that famous make, as all have dropped top tubes, Best and Lloyd semi-automatic lubricators, and one or two other detail improvements.

Terrot.

Both single and twin-cylinder Terrot are on similar lines, and both are well made, and have an excellent reputation. The twin has one vertical and one sloping cylinder, the ribs being parallel to the ground. The bore and stroke are 67 mm. × 90 mm., and the magneto is worm driven on the rear of the crank case. Though of the loop type, the frame and fittings are otherwise on English lines, and a very simple spring fork is used, and a single-cylinder model has spring rear suspension. A simple variable pulley and cone clutch can be supplied.

Motosacoche.

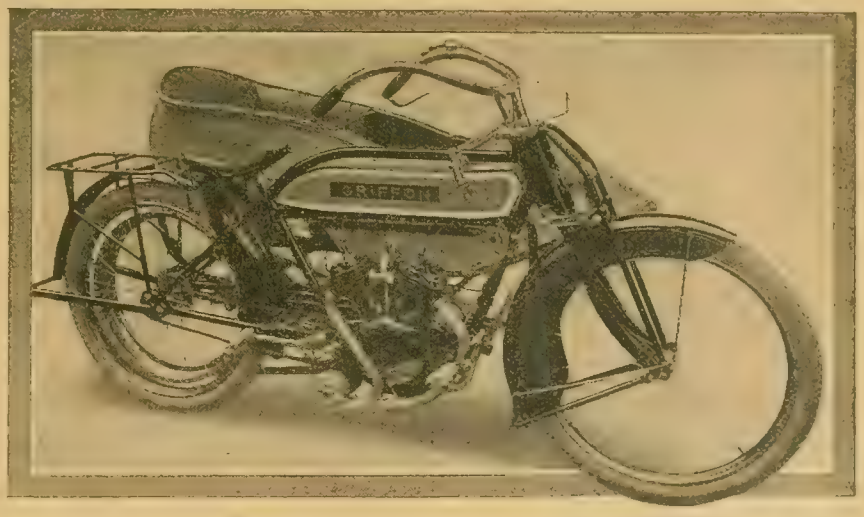
Motosacoche models are well-known to the British public and are shown in all forms. An addition is the model fitted with the 6 h.p 750 c.c. engine. Handle-starters are now fitted.

Valpic Clyno.

It was a relief to find Mr. Frank Smith on this stand, especially as our French was becoming strained. The 1914 Clyno is fitted with roller bearing big ends, pear-shaped radiating fins, and inverted lever control, otherwise it is practically unchanged, as before mentioned. A boat body was fitted to one sidecar on this stand.

Simplex.

Several types of this interesting machine are staged. It is not entirely unknown in this country, as it took part in the English-Dutch trials. The 4 h.p. engine is mounted in an unusual frame, which is designed to give maximum strength for the weight. A 2½ h.p. model is also shown in a standard type of frame. Sturmey-Archer three-speed hubs are fitted.



Valve side of the 1914 4 h.p. Griffon sidecar. As will be seen, a number of English fittings are employed.

Humber.

The 3½ and 2⅜ h.p. Humber models as already described are on view, and look very smart with their excellent finish.

N.S.U.

N.S.U. models have undergone no great change, but the well known two-speed is now fitted with a very neat and simple handle-bar control. This type of gear has a well-merited popularity, as can be seen by the number on various stands.

New Hudson.

Quite a new departure from this firm's models is the new 6-7 h.p. twin, which has a bore and stroke of 75×85 mm. The engine is a very clean piece of work. The magneto is carried behind the engine, and a Mark VII. gear is carried in the hub; some improvements and modifications have been made in the spring forks. Best and Lloyd drip oil feed and aluminium footboards are fitted, and the machine is carried out on the well-known New Hudson lines with counter-shaft drive, the finish being as fine as ever.

Rover.

Besides the usual Rover models the forerunner of the 1914 models is on view. This machine has a new bottom bracket lug and footboard which can be swung up to allow the kick starter comfortable room. The rear guard and carrier are instantly detachable for tyre mending purposes. The Mark VII. gear is fitted, and spring links are used on the top of the spring forks.

Herdtle Bruneau.

The Herdtlé Bruneau has undergone no great alterations since it was originally described in *The Motor Cycle*. It retains the two-cylinder vertical water-cooled engine, the enclosed friction gear, and final chain drive. The suspension is very unusual, the rear of the frame being carried on a combined leaf spring and rear mudguard. The radiator is carried on the front forks, and the whole machine presents a most curious appearance, though it is well built and the design is clever. A single-cylinder water-cooled engine set for attachment to pedal cycles is also shown.

French Motor Cycles and Cycle Cars.—

Matchless.

Standard Matchless machines are shown with and without sidecars and form a much admired exhibit, both 8 h.p. and 3½ h.p. twin being staged.

Peugeot.

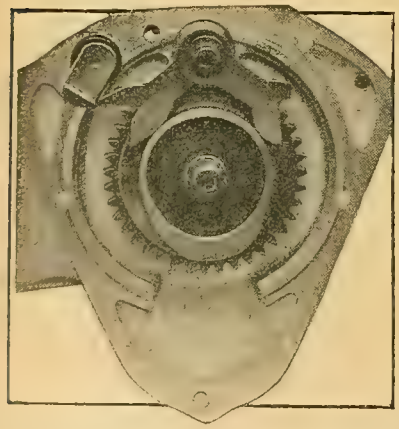
The little twin Peugeot has an engine of 55×80 mm., and is in itself a beautiful piece of work, but though the machine is fitted with an Armstrong gear and dropped tube frame, it looks less like a British machine than many others. This is largely accounted for by the loop frame, narrow tank, and the Truffault forks, which, though extremely comfortable, are not often seen on this side of the Channel. A single-cylinder 3½ h.p. model is also shown, the engine having a gear-driven magneto in front.

MORGAN RUNABOUTS FOR 1914.

The sporting and standard models of Morgans will remain practically unaltered in 1914 save for the addition of a tail to the body, in which will be found ample locker space for tools and luggage. Grand Prix types, both air and water-cooled, with overhead valves, will be notable exhibits at Olympia, while perhaps the most interesting model shown will be a new type with water-cooled cylinders and side by side valves, which should prove a very excellent touring machine. A striking exhibit will be a plated chassis.

T.D.C. ENGINES.

Although not directly exhibited at Olympia, the T.D.C. engines will be found on several complete machines in the Show. These engines are made by T. D. Cross and Co., Vesey Street, Birmingham. The standard 3½ h.p. 85×88 mm. model will have roller bearings to the big ends.



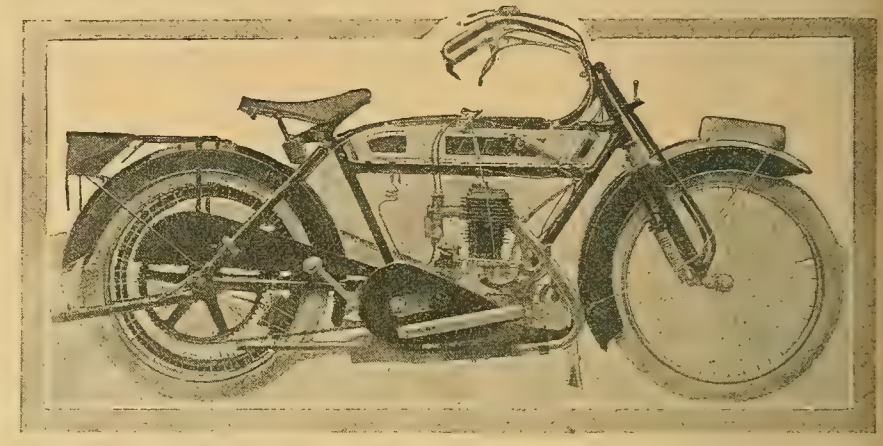
Simple timing gear of the 2½-3 h.p. T.D.C. engine. Note the exhaust valve lifter lever, which engages with a jaw on the end of the exhaust rocker.

A new model is the 2½-3 h.p., 70×76 mm., which follows the lines of the bigger engine, but is designed to enable the magneto to be fitted in front or behind the cylinder. In both cases, the armature-shaft is chain-driven.

THE L.M.C. IN 1914.

The Lloyd Motor Engineering Co., makers of the L.M.C., are making very slight alterations to their new Show models. The principal improvements are a larger tank to hold 1½ gallons of petrol. The silencing arrangement has been improved by the addition of a cylindrical expansion box fitted under the bottom bracket; into this is led the exhaust pipe, which is 1⅜in. diameter, the exit being a 1in. pipe, which extends alongside the rear wheel on the off side. A little improvement to the L.M.C. two-speed gear is that the clutch for the high gear is now held in engagement by a coiled spring, and the lever, with ball bearing on the end to take the thrust, has been done away with, as the high gear is in use the greater part of the time. This should very much facilitate the control of the gear, and obviates the necessity of renewal of the thrust bearings on the end of the lever. The chain transmission for the low speed on the off side is now completely enclosed in a metal case.

Milford and Bramble sidecars will be exhibited on the show machines.



Valve side of the latest two-speed L.M.C.

PASSENGER RECORDS AT BROOKLANDS.

In our report of the B.M.C.R.C. meeting in this issue a good many records were annexed, but on Monday last H. C. Newman, whose 85 × 88 mm. Ivy-Green-Precision sidecar was in excellent form, carried off several more. Timed by Mr. A. V. Ebblewhite, the flying kilometre was covered in 36⅖s., equal to 61.45 miles an hour; the flying mile was covered in 59⅖s., which is equal to 60.81 miles an hour, while Newman took 5m. 35⅖s. to cover the flying five miles, which works out at 53.67 miles an hour. These records stand for both the 500 and 750 c.c. classes. Newman, after covering the ten miles (standing start) in 11m. 22⅗s. (52.74 m.p.h.), went for the hour record, which, however, he was prevented from completing through a puncture, though he was successful in annexing the fifty miles, which distance he covered in 57m. 59⅖s.

It may be interesting to note that Newman's equipment comprised Dunlop tyres and belts and Amac carburetter. His records are the more interesting as this is the first time that a 3½ h.p. sidecar outfit has been officially timed to beat a mile a minute speed.

J. F. Buckingham, driving a Buckingham cycle car of 4.9 h.p. R.A.C. rating, 89×120 mm. bore and stroke, then went for records, and succeeded in annexing the cycle car records for the standing start kilometre and mile, his speeds working out at 56.78 m.p.h. and 56.6 m.p.h. respectively. Buckingham's intention had been to go for the cycle car hour record, but a broken oil pipe, combined with pouring rain, caused him to postpone his attempt.

The Buckingham cycle car was equipped with Michelin tyres, Continental belts, and Solex carburetter.

FLEXIBILITY OF CYCLE CARS.

The Cycle Car Club held some interesting flexibility tests up Woodcock Hill, near Rickmansworth, last Saturday, and the results prove an undoubted triumph for the simple belt-driven cycle car.

Every type of miniature car and cycle car competed. For instance, the Singer represented the light car class: the belt-driven machines included the Duo, Warne, and Adamson; the three-wheelers were represented by the Morgan; while the G.W.K. and Pyramid belonged to the friction-driven class.

Lionel Martin on the Singer put up fastest time of the day. In the slow climb, Mr. Welham came out on top, his time being 10m. 1s., while his average speed must have been between one and two miles per hour.

The winner was that competitor the ratio of whose slow and fast times was the greatest. Results:

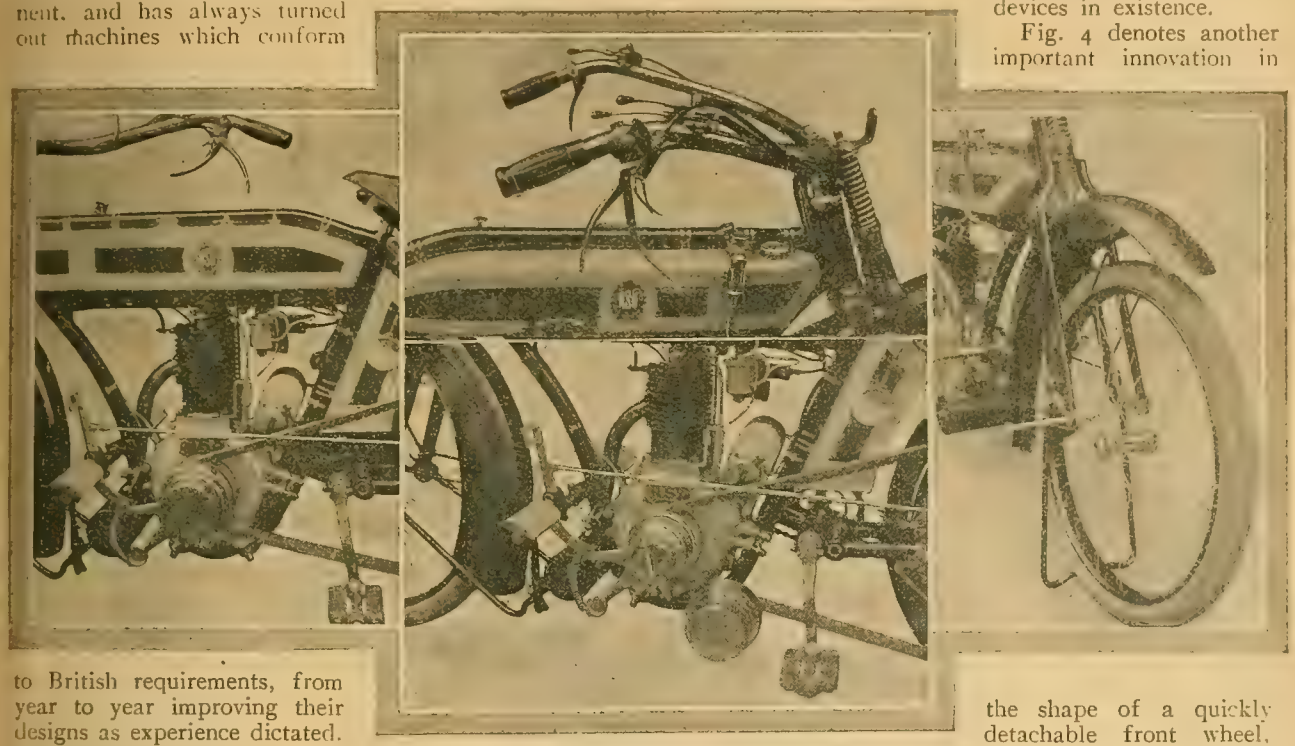
	Time of fast climb. s.	Time of slow climb. m. s.
R. Barton Adamson (8 Adamson)	43⅖	8 18⅖
A. Percy Bradley (8 Duo)	42⅕	7 57⅕
L. Martin (10 Singer) ...	29⅗	5 12
L. W. Spencer (8 Morgan)	34⅘	4 40⅗
F. Thomas (10 G.N.) ...	43⅗	5 40
H. Welham (3½ Welham)	106	10 1

N.S.U. IMPROVEMENTS.

Dust Cover for Gear. Quickly Detachable Wheels.

IN a recent issue we made brief reference to the 1914 N.S.U. improvements. The four accompanying photographs show these improvements in detail. It is not out of place to mention here that the N.S.U. firm is among the most up-to-date on the Continent, and has always turned out machines which conform to British requirements, from year to year improving their designs as experience dictated.

FEATURES OF THE 1914 TWO-SPEED N.S.U.



(1) Pressure oil pump and sight feed on the tank and the new two-speed gear control on handle-bar.
(2 and 3) The latest type of two-speed engine shaft gear. A dust cover is now provided (shown in fig. 2 in position).
(4) A quickly detachable wheel is one of the latest features.

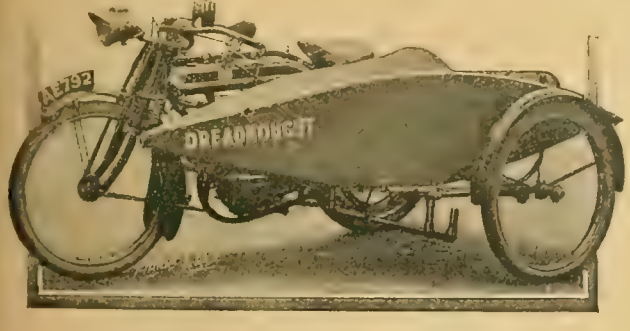
Fig. 1 shows the pressure oil pump and sight feed on the tank, and the new two-speed gear control on the handle-bar.

In figs. 2 and 3 the latest type of two-speed epicyclic engine-shaft gear may be seen, while it will be noted that the operating mechanism is now fitted with a dust cover, which is shown in position in fig. 3 and removed in fig. 2. The long brake pedal conveniently mounted on the footrest should also be noted. Incidentally, the N.S.U. gear is one of the oldest change-speed devices in existence.

Fig. 4 denotes another important innovation in the shape of a quickly detachable front wheel, which greatly simplifies tyre repairs and renewals. It is interesting to remark the substantial front wheel stand and the improved front mudguard. The fact that the front wheel can be so easily withdrawn is owing to the absence of a front brake on the N.S.U.

NEXT WEEK'S A.C.U. CYCLE CAR TRIAL.

The A.C.U. have obtained the necessary number of entries for the above trial to be held as arranged on Wednesday next. The start and finish will be at Redhill, and the course will include Reigate Hill, Dorking, Leith Hill, Gomshall, Newlands Corner, Guildford, Frith Hill (Godalming), Milford, Bowlers Green, Hindhead, Haslemere, Fernhurst, Tilford, Hog's Back, Guildford, Merrow, Leatherhead, and Walton-on-the-Hill. A map of the course will be found in our issue of October 9th, page 1316. The start is at 8.30 a.m. and finish about 4 p.m. List of entries:



The Davies racing sidecar fitted to a 3½ h.p. three-speed Premier.

J. T. Wood (G.W.K.)
C. M. Keiller (G.W.K.)
J. T. Panling (7 Swift)
John Portwine (10 A.C.)
A. C. Maitland (8 Beacon)
A. B. Phillips (8 Warne)
S. Wright (8 Humberette)
H. Dew (8 D.E.W.)
H. F. S. Morgan (8 Morgan)
L. Martin (10 Singer)
A. Walden (7-9 Premier)
R. G. Thomas (8 Pyramid)
L. F. Pain (8 Pyramid)
W. McMinnies (8 Morgan)
S. T. Marr (8 S.M.)
A. E. Coyne (8 Ranger)
V. Busby (8 Morgan)
A. C. Armstrong (7-9 G.N.)
A. P. Bradley (8 Duo)
J. Chater-Lea (8 Chater-Lea)
Auto-Carriers (6 A.C.)
Auto-Carriers (6 A.C.)
Auto-Carriers (10 A.C.)
C. Pressland (8 Crouch)
G. N. Higgs (8 G.N.)
R. B Adamson (10 Adam...)
W. Cooper (8 Humberette)
R. Mundy (8 Humberette)
E. A. Parnacott (5½ Cycar)
B. Wilberforce (G.W.K.)
H. R. Godfrey (G.N.)
John Gibson (8 Morgan)

TIME TO LIGHT LAMPS.

Oct.	23rd	... ...	5.50 p.m.
,,	25th	... ...	5.46 ,,
,,	27th	... ...	5.42 ,,
,,	29th	... ...	5.38 ,,

Next Week's Trial for Cycle Cars Only.

The necessary number of entries for the A.C.U. trial for cycle cars had been received on Monday last so the trial will take place next Wednesday. Already a number of machines have been practising on the course which is not difficult now that Pinfold Hill has been ruled out.

Silencer Regulations.

A certain Oxford don once complained to a friend, "People are always accusing me of putting the horse before the cart, and I am sure I never do such a thing." The friend agreed. Last week a motor cyclist was summoned in Wimbledon for "not having his cut-out provided with a silencer" and fined £1. Fortunately his float was suitably furnished with a carburetter, or, we presume, the fine would have been double.

Steam Cycle Car at the Show.

Among the novelties which will be on show at the Olympia Motor Cycle Exhibition will be a steam propelled cycle car, which is being constructed in the Midlands.

A 2¾-3 h.p. motor bicycle with two-speed gear and full equipment for £27 will also be exhibited. We believe this is a record figure for a complete machine of this power.

Colonial Prices.

Apropos of our leaderette in the issue of October 9th, "Colonial Prices," a Midland motor cycle manufacturer, whose business is almost entirely with the Colonies, pointed out that our New Zealand correspondent was labouring under a misunderstanding when he thought that the retail price in the Colonies should not be any more than it is at home plus the duty and freight, and he explained that the colonial buyer has to pay cash for the machine plus the freight, shipping charges, duty and packing, and it is on this total out of pocket amount that he calculates his profit. No importer would be satisfied with a profit on the net cost price of the machine in England. Importers in the Antipodes also contend that they are saddled with the additional cost of trials and competitions in their own country. The results of British trials do sell machines abroad to some extent, but motor cycles are also exploited in Colonial and Overseas competitions, and in supporting these events the importers are called upon to pay the piper—an expense which is covered by the home manufacturer when the price of the machine is fixed.

Motor Cyclist Reserve Committees.

The Secretary of the War Office notifies the following alterations in the list of secretaries, which was issued on July 4th:

North Midland Divisional Area (Northern Command). For Major G. P. Heywood, Staffordshire Yeomanry, Lichfield, substitute Captain F. H. L. Meynell, 3rd North Midland Brigade, Royal Field Artillery, Bridge Street, Stafford.

Welsh Divisional Area (Western Command). For Captain and Adjutant W. F. Basset, 7th (Cyclist) Battalion, the Welsh Regiment, 11, Newport Road, Cardiff, substitute Major B. T. Ready, Brigade Major, South Wales Infantry Brigade, 29, Windsor Place, Cardiff.

Motor Cycles and Rear Lights.

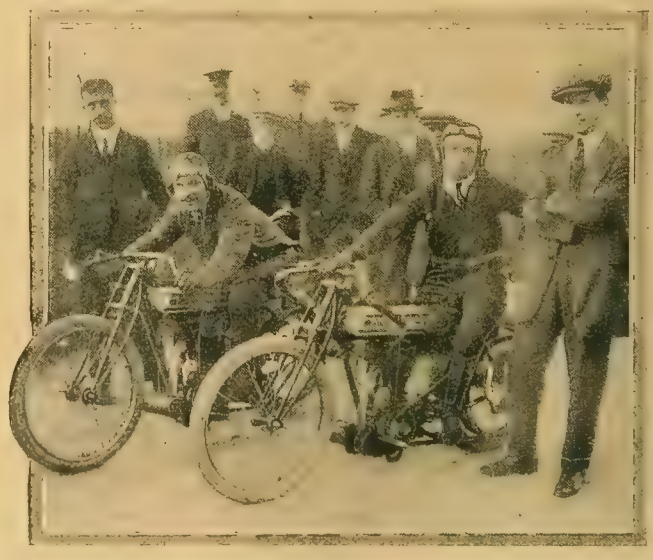
An exceedingly important case came before the Divisional Court of the King's Bench on Monday, when Justices Bailhache and Ridley held that, under the Motor Car Act, 1903, a motor cycle is a car and not a velocipede, and that in consequence it is incumbent on a motor cycle to carry a red warning rear light after dark. Mr. Justice Scrutton dissented from this reading of the Act, holding that a motor cycle was a bicycle or velocipede within the meaning of the Act of 1888. The matter came before the Court on an appeal from a decision of the Epping justices, who had fined a motor cyclist 6s. for not carrying a red light visible in the opposite direction to which the cyclist was travelling. The effect of this judgment is that the conviction was affirmed.

The Official Decision.

We understand there is no appeal possible from the judgment of this court, and the only way to make the matter perfectly clear is for the Local Government Board to issue a statement as to their view of the matter, and to state what measures will be adopted in the future to deal with the question of rear lights for motor cycles, in view of the Board's circular of the 10th March, 1904, which order makes it perfectly clear that motor cyclists need not carry a light at the rear, as required to do. The A.C.U. have already forwarded a letter to the President of the Local Government Board asking for a speedy settlement of the matter, and there is every reason to suppose that an early pronouncement will be made.

The Midland Reliability Trial—Results.

The results of the open reliability trial, held on the 4th inst., under the auspices of the Sutton Coldfield and Mid-Warwickshire A.C. are as follows: Winner of Levis Cup, L. W. Guy (Scott); winner of P. J. Evans Trophy, G. W. Hands (Calthorpe); winner of Matchless Gold Medal for best performance of a solo machine presented by Mr. F. S. Whitworth, L. W. Guy (Scott); winner of the Precision Gold car machine performance of a side-car machine presented by Mr. F. E. Baker, R. Pearson (Clyno); winner of the Team Prize presented by Messrs. H. Collier and Sons, Ltd., R. E. Guest's Matchless team. Best ascent in flexibility hill-climb, J. S. Watson (2¾ Sunbeam).



"The Motor Cycle" Cup for the one hour 500 c.c. race at Brooklands was won by C. G. Pullin (Rudge) who is seen on the right, while T. E. Greene (Rudge) on the left secured third place in the same event. S. A. Rowlandson is standing at the extreme right of the picture.

An Impudent Theft.

The rear wheel containing Sturmey-Archer hub was recently stolen from a 1913 Triumph. The owners, Messrs. W. Wilder and Sons, Crowmarsh Iron Works, Wallingford, are offering a reward of £5 for its recovery.

Racing Motor Cyclist Married.

Graeme Fenton, who is so well-known as a rider of Clément motor cycles in France, and who won the 350 c.c. class in this year's Grand Prix on the Amiens circuit, was married last week in Paris to Miss Sturrock, of Birmingham. The wedding took place at the English Embassy and at the English church in the Rue d'Aguesseau. We extend our congratulations to the happy pair.

News from France.

It seems likely that the International Six Days Trial will be held either in the Dauphiné or the Puy-de-Dome. Several delegates from the Motor Cycle Union of France, among whom we may mention Messrs. Fenton, sen., and G. Longuemare, have been instructed to investigate a suitable course. We shall hope to hear something more definite about this after the International Conference to be held in Paris next Saturday.

Tubs or Baskets !

A correspondent writes : "While going over Whinlatter Pass (part of the Six Days Trial course) recently, I happened to call at a very out-of-the-way farm-house. Both the farmer and his wife are about eighty years of age and live by themselves, so they do not get much of the current news. In talking I asked the old lady if she had seen any of the motor cycles passing, and was somewhat amused when she answered in the broadest Cumberland, 'Oh, yes; we saw them, and we did laugh, for some of them brought their sweethearts up in washing-tubs fastened on to the side of their bicycles, while one brought his up in a basket.'"

FUTURE EVENTS.

Oct. 25.—Herts M.C.C. Open Flexibility Speed Trials.
" 25.—Mersey M.C. Open Trial.
" 29.—A.C.U. Open One Day Trial for Cycle Cars.
Nov. 1.—Streatham and District M.C.C. Open One Day Trial.
" 7-15.—Motor Car Show at Olympia.
" 24-29.—MOTOR CYCLE & CYCLE CAR SHOW AT OLYMPIA.
Dec. 26-27.—Motor Cycling Club Winter Run from London to Exeter and back.

Paris-Nice Trial in the Spring.

The Paris-Nice Trial will be held again next year, and it is expected that the route will be continued, after Lyon, over the mountains from Grenoble. Instead of ending at Nice, the trial will probably be terminated at Monaco. The course will be certainly more difficult than last year.

A.C.U. News.

On page 1310 of our issue of the 9th inst., a letter appeared in the correspondence which suggested that a one hour record made at a speed of 50.99 miles an hour should cover all existing records up to one hour, and should beat an existing five miles record made at a speed of 50.56 miles an hour. The A.C.U. has decided, however, that to stand a five miles record must be separately attempted.

The Cycle Car Trial.—The following officials have been appointed for the cycle car trial on October 29th: Stewards, Major F. Lindsay Lloyd, R.E., Messrs. J. R. Nisbet and A. Sharp; judges, Mr. Glyn Rowden, The Rev. E. P. Greenhill; timekeeper, Mr. A. V. Ebblewhite.

Permits have been granted to the Herts. County A.C. to hold an open trial on October 25th, and to the Foleshill and Warwickshire M.C.C. to hold a hill-climb on October 25th.

Membership.—Although the present month is one in which few members are expected to join the A.C.U., the increase has been most satisfactory. One hundred and seventy-five touring members and twelve full county members have been elected. Two overseas motor cycle clubs, the Colombo M.C.C. and the Rangoon M.C.C. have become affiliated.

Fees for Records.—It has been decided that a permit for attempt at record should be available for any number of attempts within one calendar month of the date of issue, provided that no record has been claimed in making these attempts.

The Classification of Sidecars and Cycle Cars.—All three-wheeled motor vehicles, other than motor bicycles and sidecars, coming within the weight and engine capacity limits of a cycle car will in future be treated as such.

Definition of a Sidecar Combination.—By the term motor bicycle with sidecar is meant a three-wheeled vehicle consisting of a motor bicycle to which a chassis is attached carrying a body or seat for the passenger or passengers.

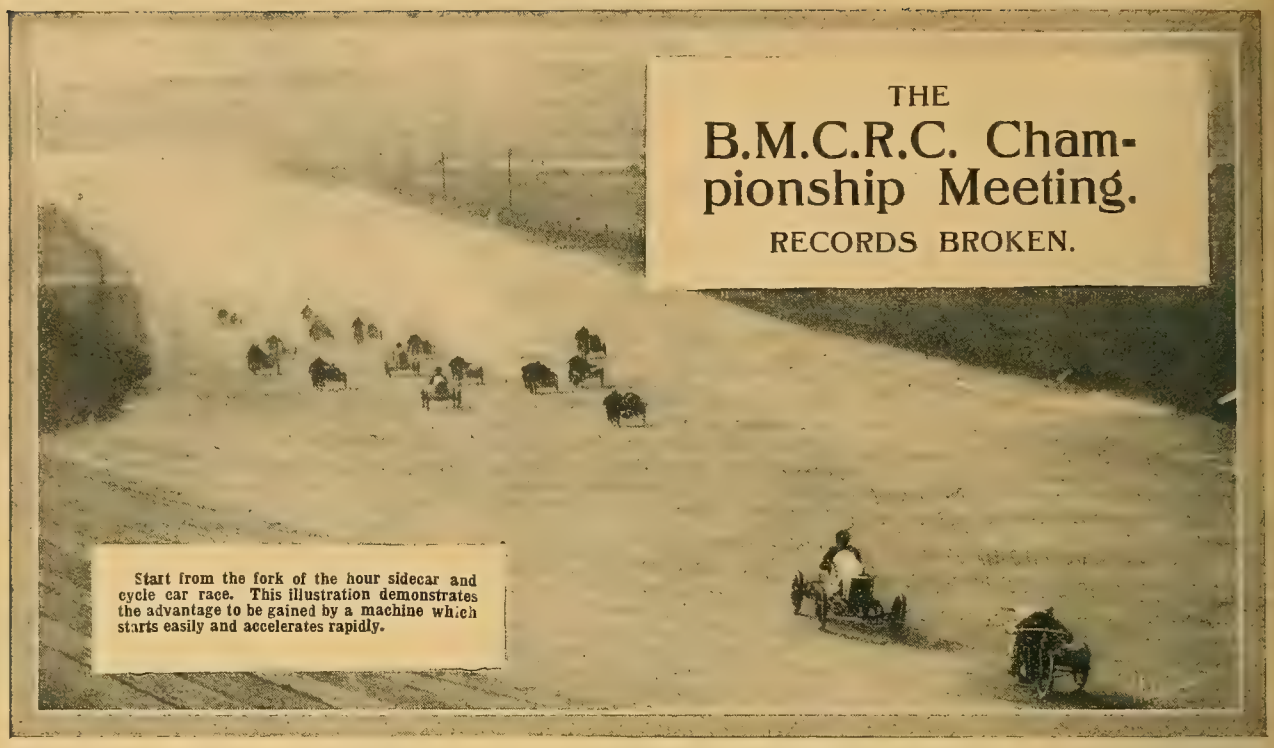
A Conference with the R.A.C.—A conference between certain delegates of the A.C.U. with certain members of the R.A.C. will shortly be held to discuss the cycle car question. The Auto Cycle Union will be represented by the Rev. E. P. Greenhill, Messrs. G. S. Carter, A. V. Ebblewhite, I. R. Nisbet, Otto Thomas, W. G. McMinnies, and Dr. A. M. Low, D.Sc., and the Secretary.

The Meeting of the F.I.C.M.—On Saturday next the annual meeting of the Fédération Internationale des Clubs Motocyclistes will be held at the Automobile Club de France in Paris, at which the classification of cycle cars, the 1914 International Trial, and other matters will be discussed. Messrs. T. W. Loughborough, Secretary of the Auto Cycle Union, and E. M. P. Boileau (*The Motor Cycle*) have been instructed to represent British interests.

L. W. Spencer (8 h.p. Morgan) nearing the finish of the slow climb in the Cycle Car Club's flexibility hill-climb last Saturday.

THE B.M.C.R.C. Championship Meeting.

RECORDS BROKEN.



Start from the fork of the hour sidecar and cycle car race. This illustration demonstrates the advantage to be gained by a machine which starts easily and accelerates rapidly.

AS if to make up for the delinquencies of the clerk of the weather on the 11th inst., last Saturday was perfectly glorious, more like spring than autumn, and so warm that before mid-day no one wore his coat. The wind, however, which blew against the men in the railway straight, was rather strong. The meeting started at 10 a.m. with time trials, during which we had an opportunity of noting interesting fitments on several of the machines. The Singer cycle car body possessed a cocked up tail which gave it a peculiar appearance. Tessier's water-cooled Bat was quite an interesting machine; overhead valves are fitted, while the wide and unbroken honeycomb radiator which lies across the down tube and the large water pipe are worthy of note. Ware, on his weird sidecar body, carried a spare oil tank, fitted with a pump designed to be worked by the passenger for the purpose of replenishing the main oil tank. Pullin's Rudge had a large oil tank partly encircling the bottom of the saddle tube, and fitted with a pump worked by a specially designed hinged foot-rest connected to the pump spindle by a Bowden wire. Among the non-competing machines we noticed a Douglas with a pipe from the acetylene generator led into the carburetter air inlet and provided with a Y joint, one branch of which led to the crank case, leading one to suppose that the acetylene gas was sent into the cylinders by forced induction. A. J. Stevens's 5 A.J.S. sidecar was provided with an excellent spring seat pillar.

The Speed Trials.

During his attempt on the flying mile and kilometre S. R. Axford, who was riding a very fast 270 c.c. Martin-Jap, collided with a pedal cyclist and was badly shaken and grazed his wrists, and to add to his disappointment he found afterwards that he had not been timed.

Some extremely fine performances were made in these trials, the most notable being E. Remington's performance in the big twin class in attaining a speed of 85.38 m.p.h. on an 8 h.p. Matchless-Jap—the biggest speed attained on a motor cycle for some time past. Even the redoubtable Collier was beaten. Stanley, as usual, easily headed his two classes, and Cocker on another Singer headed the 500 c.c. sidecar class. Newman's Ivy-Green was not in its best fettle, for it has done much better in practice.

The complete results are given in the next column.

Rider and Machine.	Bore and Stroke.	C.C.	Kilometre.		Mile.	
			Time.	Speed.	Time.	Speed.

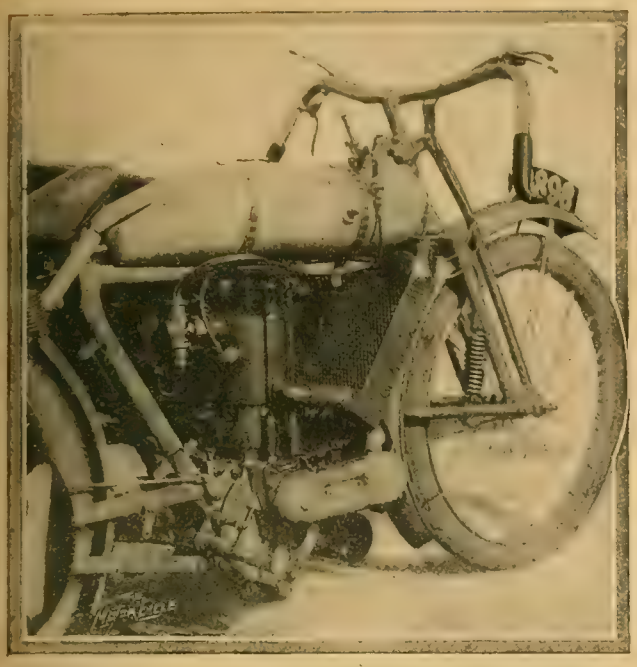
ILIFFE & SONS LTD.,
TRANSFER SPECIALISTS, COVENTRY.
London: 20, Tudor St., E.C.



A single-cylinder water-cooled Bat-Jap sidecar ridden by S. T. Tessier. The large honeycomb radiator will be observed.

with a sidecar carrying a passenger weighing not less than 140 lbs. All started in line except the Singer cycle car, which had to take a place behind the others, and all got away in good form except Newman. At the completion of the first lap the Calthorpe was leading, followed closely by the Singer. After an interval came Ware, who was well ahead of the other sidecars, followed by Collier, Cocker, Pullin, Newman, Buckingham, Mills, Sumner, Garrett, Le Vack, Tessier, Heinzel, Holden, Hoare, and Campbell. After the first lap the Buckingham did not appear again. The Calthorpe ran magnificently, and gradually increased its lead over the Singer. Among the sidecars, Ware continued to hold his own. In his sixth lap Le Vack retired owing to a broken inlet valve, and Cocker dropped out, while Tessier retired in his ninth lap. It is curious how men group together in these races. Hoare, Newman, and Pullin formed one group, which kept intact for several laps, while Holden, Garrett, and Campbell composed another which hardly ever separated. Ware, Collier, and Hoare held first, second, and third places respectively in the sidecar class until the 7th lap, when Newman took third place, which Pullin seized in the ninth lap, and this order did not alter till the end. Ware rode a magnificent race. The Calthorpe, which had run so well, gave up in its sixteenth lap owing to a broken differential casing. Hoare's retirement was due to his magneto coming loose, while Jephson had to abandon the race in his first lap owing to a cracked cylinder. The results divided up into classes were as follows:

	Bore and stroke.	c.c.	mls.	yds.
Class B.				
H. V. Colver (2-cyl. Enfield sc.)	60×61	350	40	98
Class C.				
*C. G. Pullin (1 Rudge sc.) ...	85×88	499	52	764
S. F. Garrett (1 Regal-Green sc.)	85×88	499	50	1,122
H. C. Newmann (1 Ivy-Green sc.)	85×88	499	50	1,122
K. Holden (1 B.S.A. sc.) ...	85×88	499	49	733
A. V. Sumner (1 Zenith sc.) ...	85×88	499	41	702
Class D.				
†E. B. Ware (2 Zenith sc.) ...	76×82	748	56	542

J. L. Buckingham (1 Buckingham)	89×120	746	1	lap

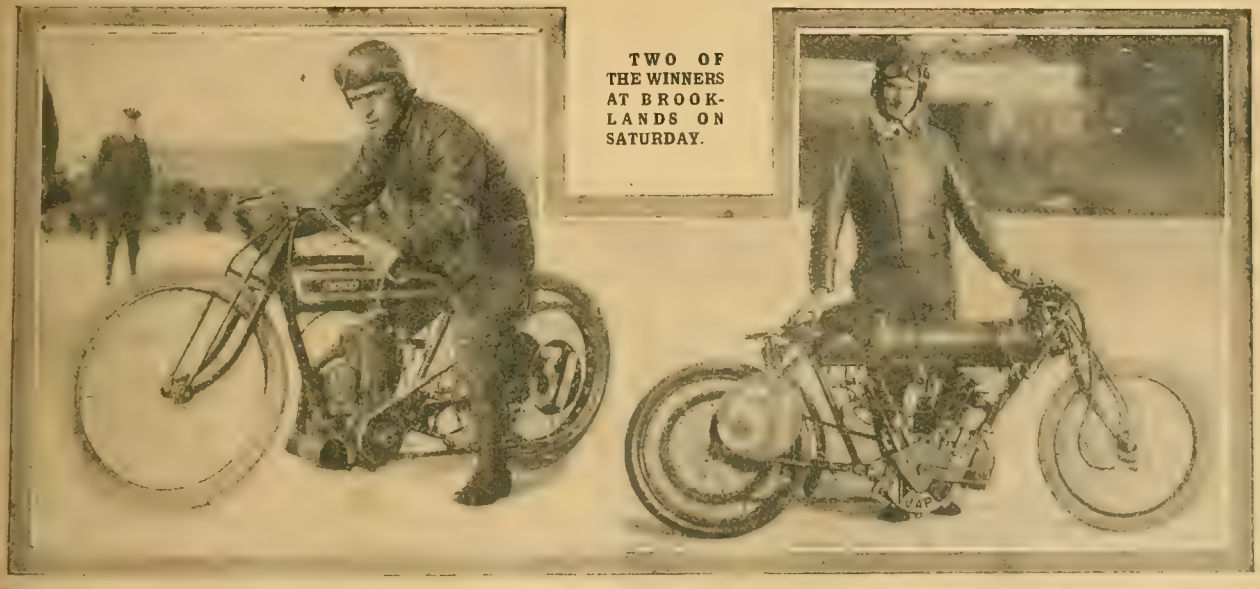
* Record, beating S. F. Garrett (2 Green), 50m. 1,740 yds., 50.99 m.p.h., October 12th, 1912; also the fifty miles record, beating Garrett, 58m. 45.2s. Pullin's time, 57m. 47⅕s.

† Record, beating Garrett (2 Green, 499 c.c.), 50m. 1,740 yds., October 12th, 1912; also the fifty miles record; also beating Garrett as above.

The A.C.U. Junior Championship.

Racing was then adjourned for an hour for lunch, after which the afternoon programme opened with the Junior One Hour Championship Race, for motor bicycles not exceeding 350 c.c. First prize, *The Auto* Challenge Cup (presented by the proprietors of the then *Automotor Journal*

TWO OF THE WINNERS AT BROOKLANDS ON SATURDAY.



(1) G. E. Stanley (3½ h.p. Singer), who won the junior hour race, and broke the 350 c.c. hour record by covering 62 miles 1,199 yards. (2) E. Remington (8 h.p. Matchless), winner of the Five-lap A.C.U. Championship.

A string of competitors at the start of the hour sidecar and cycle car event.

to the R.A.C. in 1900 as a perpetual trophy) and the A.C.U. gold medal; second prize, the Club's gold medal; third prize, the Club's silver medal; fourth prize, the Club's bronze medal.

In this race Alexander rode the new overhead valve Douglas. Axford's Martin was conspicuous for its neat exhaust pipe arrangement, one pipe from each cylinder being fitted each side of the machine. All made a good start, but Alexander nearly upset Elwell. The completion of the first lap was heralded by a group all in close order, of which the first was Stanley, who was followed by Newman, Mason, Alexander, and Williams. Then after a short interval came Edmond, Axford, Elwell, Greaves, Heinzel, Colver, and Holzapfel, whose engine was misfiring and continued to do so throughout the race. Axford's luck was out on Saturday, for a plug and a tyre badly lacerated by a nail put him out of the running in the second lap. Stanley, Newman, and Williams led for the first five laps, and then Alexander assumed third place, while Williams dropped back, and finally had to stop in the seventh lap owing to a sticking tappet. Elwell had also to pull up owing to a stretched valve, which he had to change. Alexander continued to hold third place till his twelfth lap, when Newman's withdrawal placed him second. Then in the thirteenth lap (unlucky number!) a broken inlet tappet rod placed him *hors de combat*. Stanley meanwhile continued to forge ahead and increase the miles between the first and second places. Mason was now running second and Edmond third. Then Edmond retired, and Greaves, whose machine was running most consistently, was third. The result was as follows:

	Rider and machine.	Bore and stroke.	c.c.	mls.	yds.
1.	*G. E. Stanley (1-cyl. Singer)	75×79	349	62	1,199
2.	H. Mason (2 Nut-Jap) ...	60×61	350	58	556
3.	H. Greaves (2 Enfield) ...	60×61	350	54	1,042
	H. V. Colver (2 Enfield) ...	60×61	350	52	885
	A. Holzapfel (1 Regal-Green-Precision)	70×90	347	51	872

*Record, beating Stanley's previous hour record, 16th July, 1913, 62 miles 920 yards.

The Five-lap A.C.U. Championship.

The next event was the only short distance race in the programme. This was the Five-lap A.C.U. Championship Race, for motor bicycles up to 1,000 c.c. First prize, *The Motor Car Journal* Challenge Cup (presented by the proprietors of the above journal to the R.A.C. in 1900 as a perpetual trophy) and the A.C.U. gold medal; other prizes as in the preceding race.

An inspection of the machines before they started revealed the fact that the majority were fitted with Senspray carburetters. All the competitors were mounted on big twins except Stanley. All got away well, and as they finished the first lap were almost equally spaced out. The order was George, Remington, Collier, Stanley, Hellaby, Baragwanath, Howard, and Baldwin.

In the second and third laps the order of the first three was unaltered, Baldwin's belt came off at the end of the third lap. In the fourth lap, Remington was leading easily, H. Collier was second, and George third. In the last lap the order was the same, but Collier, who had broken down, did not cross the line. His machine appeared to have had sufficient momentum to do so, and had he stuck to it he would have had had an excellent chance of finishing second. Result:

	Rider and Machine.	Bore and stroke.	c.c.	Time. m.	s.
1.	E. Remington (2 Matchless-Jap)	90 ×77.6	986	10	40*
2.	S. George (2 Indian)	82.5×93	994	11	12⅘
3.	G. E. Stanley (1 Singer) ...	85 ×88	499	11	27⅘
	J. A. Hellaby (2 Indian) ...	82.5×93	994	12	5⅘

*Speed, 76.43 m.p.h.

The Senior A.C.U. Championship.

The last event of the day, for which the largest number of entries had been received, was the popular Senior One Hour A.C.U. Championship Race for motor bicycles not exceeding 500 c.c., for *The Motor Cycle* Challenge Cup (presented to the R.A.C. in 1900 as a perpetual trophy for a one hour motor cycle race). Other prizes as in the preceding races.

The first lap order was Cocker, Hill, Pullin, O'Donovan, Green, Miller, Carryer, Garrett, Hoare, Edmondson, Le Vack, Grenfell, Hawkes, Baker, Cushman, and Abraham.

In the second lap Hill was the leader, Cocker second, and Pullin third. In the third lap Pullin assumed the lead, which he held for the next fourteen laps, Hill kept the second place for the next five laps, but O'Donovan, who, though driving an engine which, to use his own expression, "had not seen petrol" before the race, was gradually gaining ground, and in the eighth lap took second place, which he held for some time. Then the newness of the engine eold, and a seizure brought him up in his tenth lap. Meanwhile Pullin kept the lead, and very little separated the next two men, Cocker and Hill.

An Exciting Finish.

At the end of fifteen laps Hill had had two stops, and Green was pressing him hard. In the seventeenth lap Pullin stopped for oil, and now Cocker was ahead, and kept the lead for four laps. Meanwhile Pullin gradually picked up and amidst great excitement passed his rival in the twenty-second lap. It is a strange fact that in every race we recollect for *The Motor Cycle* Cup since 1903 there has been an exciting finish. Result:

	Rider and machine.	Bore and stroke.	c.c.	mls.	yds.
1.	C. G. Pullin (1-cyl. Rudge)	85×88	499	64	298
2.	J. Cocker (1 Singer) ...	85×88	499	63	1,707
	T. E. Green (1 Rudge) ...	85×88	499	63	1,380
	L. Hill (1 Rudge)	85×88	499	60	1,034
	F. Carryer (1 Imperial-Jap)	90×77.5	493	58	1,124
	S. F. Garrett (1 Regal-Green-Precision)	85×88	499	57	125
	W. Edmondson (1 Triumph)	85×88	499	56	800
	P. H. T. Hoare (1 C. and H. Jap)	90×77.5	493	54	1,446
	J. G. Grenfell (1 Norton)	79×100	490	53	689
	W. D. Hawkes (1 Ixion-Precision)	85×88	499	49	1,096
	G. W. Baker (1 Veloce) ...	85×88	499	46	353
	M. G. Abraham (1 Zenith-Green)	85×88	499	46	353
	L. Cushman (1 N.L.G.-Jap)	85×85	482	43	350
	H. Le Vack (2 Motosacoche)	64×77	496	38	83
	D. R. O'Donovan (1 Norton)	79×100	490	10	laps.

It's RESULTS that count!

—and the results obtained from the "RELIABLE" Belt have given perfect satisfaction to its users—for proof—note the following letters from "RELIABLE" Belt users—a few of the many received:—

"Re Reliable Belt which I bought from you on July 1st, 1913, I am pleased to tell you it is the best belt I have ever used during my twelve years riding a Motor Cycle, having run about 1,500 Miles on 3½ h.p. Motor Cycle with Sidecar and Phillipson Pulley. On August 6th I won Silver Medal (2nd Prize) in the Manchester Motor Club Reliability Run to Colwyn Bay and Back, also on Sept. 20th, Gold Medal (1st Prize) in the Manchester Motor Club Hill Climb. Both events with your Belt. I recommend it to all my Motor friends. Wishing you every success with same."

F. KNIGHT, Pendleton, Sept. 25th, '13.

"With reference to the 1 inch Reliable Belt you supplied me with in July last. I have been using this Belt continuously since that date, and have covered in all 2,294 miles—including an 800 mile tour in Wales on my 8 h.p. Matchless and Sidecar, and have not had occasion to touch the belt at all. It seems good for at least another 2,000 more miles yet. I am more pleased with it than I have ever been with any other belt before, and its flexibility and strength are most surprising, and I am sure could not be too highly praised." T. S. RIGBY, Perry Hill Farm, Quinton, 19th Sept., '13.

"You will be interested to know that I won the Triumph Cup in the Westmorland M.C.C. Reliability Trial, Sept. 21st, using your Reliable Belt. The Trial was originally held on 31st Aug., but five of us tied, and the re-run took place yesterday, over a course which included nine of the A.C.U. Six Days Test Hills. I have had to ride 500 miles to get this Cup, and the 'RELIABLE' is in A1 condition."

A. ARTHUR GREGSON, 12, Hesketh Road, Southport, Sept. 22nd, '13.

WINS on the "RELIABLE" Belt!!

At Brooklands, Sept. 30th, Mr. D. R. O'Donovan on Norton, fitted with **"RELIABLE" Belt, broke 4 World's Records, viz.:—**

CLASS C and D. FLYING 5 MILES — 4 min. 11⅗ secs. — 71.54 m.p.h. CLASS C and D. STANDING 10 MILES — 8 min. 48⅘ secs. — 68.08 m.p.h.

BRIGHTON Open Speed Trials, Sept. 20th. — CLASS II. for Racing Lightweights, Experts' Division. Mr. J. P. Le Grand, FIRST. Mr. W. A. Jacobs, SECOND — both used "RELIABLE" Belts. 3½ h.p. Norton machines, fitted with "RELIABLE" Belts, obtained the following results: — FIRST in 500 c.c. Touring Class, General. FIRST and THIRD in 500 c.c. Racing Class, General. SECOND in 750 c.c. Racing Class, General. Also a Big Four Norton (fitted with "RELIABLE" Belt) with 14-stone rider, successfully climbed STOUP HILL — which had never before been conquered by a Motor Cycle, in spite of many numerous attempts.

B.M.C.R.C. Meeting at Brooklands, Sept. 13th. TIME TRIALS. Class E. Kilo. and Mile. F. W. Barnes (Zenith) FIRST. SIDECAR RELAY RACE, F. W. Barnes (Zenith) FIRST. 10 MILE RECORD RACE FOR SIDECARS. F. W. Barnes (Zenith) FIRST and also broke the 10 MILE CLASS E SIDECAR RECORD. All on "RELIABLE" Belts.

Westmorland M.C.C. Reliability Trial, Sept. 21st. TRIUMPH CUP, WON by Mr. C. Arthur Gregson, using "RELIABLE" Belt.

Birmingham to Carlisle and Back, Open 24 Hour Trial, Sept. 19th. S. A. Rowlandson (Rudge-Multi) GOLD MEDAL. A. G. D. Clease (Rudge) GOLD MEDAL. Both used "RELIABLE" Belts, untouched from start to finish.

—If you want to WIN events use the "RELIABLE" Belt results have proved its supremacy! Try it!! Ask for our new folder, "A Better Belt Way."

LYCETT'S, "The Saddlery," Bromley St., Birmingham.

New Edition. *Now Ready.*

SIXTEENTH EDITION REVISED and ENLARGED

THIS new edition of "Motor Cycles and How to Manage Them" is, in many ways, a great improvement on its predecessors. It has been entirely revised and brought up-to-date by the staff of "The Motor Cycle." 50 extra pages and nearly 100 new illustrations have been added. The chapters on the Carburetter, Transmission, and Gearing, have been enlarged considerably, and form a very important feature of the new edition. New matter is included dealing with Cycle Cars. Every user of a motor cycle, and every purchaser of a new or second-hand machine, will find this book interesting, instructive, and helpful.

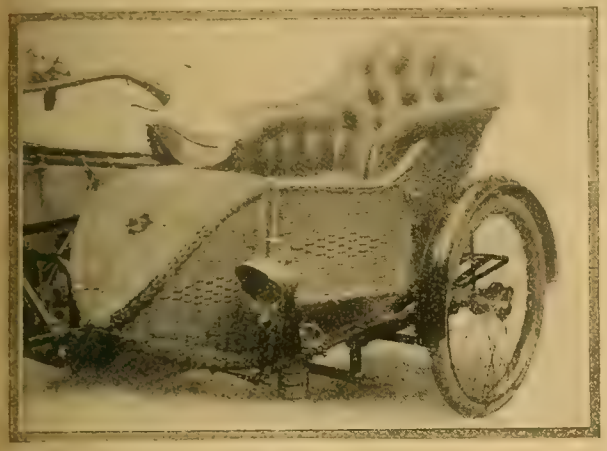
Price 1/- net. **By Post, 1/3.**

Obtainable from
Iliffe & Sons Ltd., 20, Tudor St., London, E.C.,
and all booksellers and bookstalls.

AMONG THE ACCESSORIES.

The Samson Sidecar.

A very strong and comfortable sidecar is that sold by Reg. Samson, Motor Works, Islington Row, Birmingham. The body, which is made of art cane and well upholstered throughout, is suspended on C springs on a dual dropped chassis. A spacious cupboard for spares is placed underneath the seat. Fitted

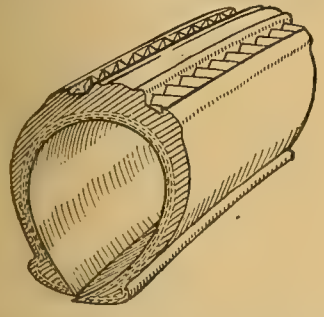


The Samson cane sidecar.

with a large apron and Clincher 2¼in. tyre, it makes a very workmanlike job, and sells for just under £12. It is shown attached to a 3½ h.p. Reg. Samson, one of the features of which is a special tank holding two and a half gallons of petrol.

Roberts Moulded Tyre.

In addition to the large variety of rubber goods handled by Messrs. the A. Roberts Non-skid Tyre Co., St. Mary Street, Birmingham, a new tyre is to be marketed shortly. Our sketch illustrates the pattern of the tread to be used on the 2¼in. tyre, which is moulded on car lines and very stoutly constructed.

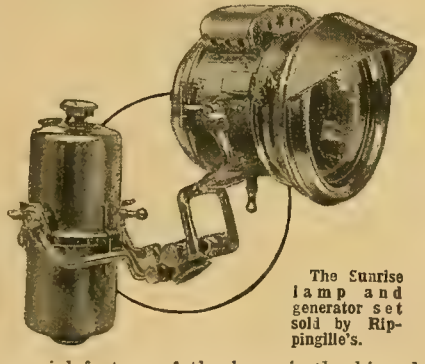


Special attention has been paid to the walls and beads, which, in some tyres, are a frequent source of trouble, and the tread has been designed to give a good rolling surface in the centre with a gripping pattern at the sides. 2¼in. and 3in. tyres will be manufactured on the same general lines, though the tread of the 3in. may be slightly varied. These tyres are made of excellent material, and, owing to their special construction, should wear well.

Rippingille's Separate Generator Lamps.

A few days ago we had an opportunity of inspecting one of the Rippingille motor cycle lamps and separate generators which this firm is marketing. Rippingilles have a splendid name for their oil stoves, and their motor cycle lamps and generators have previously been supplied mostly to trade customers, but they are launching out on their own account, and a very substantially constructed well-designed lamp was the one submitted to us, and which we illustrate. The firm have adopted the name of "Sunrise" for all their motor lamps. As will be seen, the generator has a shackle fastening for the gas joint, and the position where the gas tube leaves the generator obviates all bends in the tubing, and gives a direct feed to the lamp; it is almost an ideal position for the feed tube.

The bracket is adjustable for either ⅞in. or 1in. pillars, and both lamp and generator can be set at any desired angle. A special feature of the lamp is the hinged back, which renders the Mangin mirror easily accessible. The burner has a focussing adjustment, the bell of the lamp being fitted with a reflector extension. The dimensions of the lamp are 6½in. high, front 6in diameter, the Mangin mirror being 4¾in. in diameter; a 14 litre Roni burner is used. The generator is 8½in. high and 3¼in. diameter. This set is sold at the moderate price of 35s., nickel plated.



The Sunrise lamp and generator set sold by Rippingille's.

In addition to the above, Rippingilles make a number of small gas and oil lamps suitable for light cars and cycle cars, their latest type round generator being particularly suitable for this class of vehicle.

Improved Roc Gear.

We illustrate herewith the large clutch model Roc hub gear with double fulcrum adjustment, which is specially designed for sidecar work. One of the advantages of this gear is the ease with which the back wheel can be taken out for tyre replacement or repair.

The latest pattern Roc gear, which has a very large clutch.

Attwood's Sidecar Body.

The illustration shows a very neat sidecar body made by F. Attwood and Co. (C. H. Apsey), 99-107, Rosebery Avenue, E.C. This body is made of sheet metal panels riveted together, and has a very smart appearance. We had the pleasure of a ride in Mr. Apsey's sidecar, which was fitted to a 1913 three-speed Excelsior machine. In spite of the fact that the road surface was appalling owing to the great number of pot-holes we found the sidecar extremely comfortable. Owing to the long nose of the sidecar, there is enough leg room for the tallest person. There is a tool compartment under the seat, and the sidecar we tried was fitted with a detachable lining fastened by spring studs. The cape would protect the passenger in any weather.

The cushion was of the type employed in car practice—leather padded with horsehair and containing nine coil springs. A special feature is the large "boot."

Attwood's sidecar which has a tyre boot at the rear.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Blackpool to Skipton.

Would you kindly tell me the best way, not necessarily the shortest, from Blackpool to Grassington, near Skipton, for a 3½ h.p. and sidecar, avoiding steep hills if possible?—J.B.

Route: Blackpool, Lytham, Preston, Whalley, Clitheroe, Gisburn, Skipton, Rilstone, and Grassington.

How to Find Cubic Capacity.

Will you be so kind as to give me the formula for working out the cubic capacity of a petrol engine, provided that the bore and stroke were given? In your paper I saw a formula given, but I did not understand it. It was $D^2 \times S \times 7,854$, I think, but what do D and S stand for? For example, an engine of 90 mm. bore × 90 mm. stroke, what is the cubic capacity? I see in a catalogue of J.A.P. motors an engine 120 mm. × 120 mm., two cylinders set at 90°. Is this suitable for fitting to a motor cycle?—A.R.L., Ceylon.

The formula given is quite correct. D^2 equals the bore of the cylinder squared, and S the stroke. If you multiply this by 7,854 it will give you the cubical capacity. A single-cylinder engine 90 × 90 would be 572 c.c. An engine 120 × 120 mm. two-cylinder would be too large for a motor bicycle.

North London to Brooklands.

Would you be so good as to give me some idea as to my best route from Wood Green, N., to Brooklands, avoiding the City of London, as I have a 1913 Douglas and sidecar (two-speed) and passenger?—F.W.F.

We have pleasure in giving you the following route, which is clearly shown on the R.A.C. Official Map of Recommended Routes Round London (which can be obtained from these offices, price 1s. 7d. post free): Muswell Hill, Fortis Green, Finchley, down Fitzjohn's Avenue, at the bottom of which turn right and go down West End Lane, past West Hampstead Station, down Cavendish Road, Wrentham Avenue, to Royal Oak, where turn left and follow the tramlines to Acton, then through Gunnersbury, Kew, Richmond, Petersham, and Kingston, where you join the Portsmouth Road, which follow through Cobham and then turn right for Brooklands after leaving the village.

Beckennam to Deal.

Would you kindly tell me the best route from Beckenham to Deal, passing through Westgate-on-Sea?—D.M.

Your best route would be as follows: Beckenham, Bromley, Farnborough, Riverhead, Borough Green, Maidstone, Charing, Canterbury, Westgate-on-Sea, then go through Ramsgate and Sandwich to Deal.

Acid for Batteries.

Would you kindly let we know the way to make new acid for my motor cycle battery as I want to renew it?—J.A.

If you will refer to page 222 of the sixteenth edition of "Motor Cycles and How to Manage Them" you will see instructions for filling accumulators with fresh acid. This should have a specific gravity of 1.20. The acid should always be added to the water, and the preparation should be allowed to cool before it is put into the accumulator. The specific gravity is found by means of a hydrometer.

Slow Running Difficulty.

I have lately purchased a second hand 5½ ...S.C. two-speed which I find difficult to start. I have examined magneto, and the timing seems correct from instructions in your handbook. The B. and B. carburetter, instead of being attached in the centre of the cylinders, is at the rear end of machine. Would this make any difference? The machine will not fire at a slower speed than 15 m.p.h. Would Badcock's pilot jet make any difference? The two-speed N.S.U. gear, after running a short distance, gets very loose on the shaft; it does not come off, but wobbles about tremendously, and yet before starting I can tighten it up so that it will not move a fraction either way. Would you please inform me why it should get so loose?—H.H.

See that your magneto points are clean and that the faces meet truly; if this does not cure the hard starting and enable slow running, make quite certain that there are no air leakages between the

MOTOR CYCLES IN THE WILD WEST.
A group of American motor cyclists in the back forests of America. Another instan e of the ubiquity of the motor cycle.

carburetter and the engine. We believe the engine you are speaking of is fitted with atmospheric inlet valves. The opening of these should not exceed $\frac{5}{16}$in., and it is quite possible that the springs are too stiff to allow the valves to open at low speeds. The position of the carburetter at the back of the inlet pipe is standard on that machine, and is not likely to be the cause of the trouble. Badcock's pilot jet would probably improve matters.

The trouble with the two-speed gear is unusual, and as we are unable to examine the case, we would suggest that the key, by means of which the gear is fitted to the crankshaft, is a bad fit. Probably a new key properly fitted would cure the trouble. Consult the makers.

Improving an Old Machine.

I have a 1904 2¾ h.p. Kerry to which I propose fitting a magneto which will have chain drive, being driven at half engine speed from the camshaft. (1.) I wish to know whether the camshaft, which is ⅜in. diameter and has a ⅛in. hole right through one end of it, will be sufficiently stout to withstand the strain of driving the magneto. (2.) Can you inform me why sometimes my engine suddenly stops and when restarted will run for some yards as though each explosion were a tremendous effort, and then suddenly start going properly without my having altered the position of the controls? (3.) I further propose converting my automatic inlet valve to mechanically operated by means of overhead mechanism. This will be worked by means of a cam fitted on the camshaft. Will this alteration make for distinct improvement in running, and is the conversion to be recommended? (4.) I cannot, do what I will, get the engine to take full throttle. The carburetter is a 1913 Senspray, and I use 28 jet with petrol and 26 with benzole. If I open the throttle more than about half-way the engine starts to slow up and fires erratically, yet when I bring the control back it picks up speed again. —A.R.J.

(1.) Your query as to whether the camshaft is strong enough to perform the work of driving the magneto is one that we cannot possibly answer without inspection, and we advise you to consult some practical mechanic in your neighbourhood who would be able to advise you. (2.) The symptoms you describe of your engine slowing up and then going on again quickly might be due to many things, probably unsuitable adjustment of the carburetter for slow running, insufficient lubrication, or else the jet of the carburetter has some obstruction in it which rises and falls, but does not come clear out of the jet. (3.) Probably the conversion you mention would improve the running of your machine. It is highly necessary for you to arrange that the rod working the rocker to the inlet valve should be made adjustable in order to take up wear. (4.) The reason you cannot give your engine full throttle is probably because the carburetter will give more gas than the engine will take, and in that case the engine will choke up as the mixture would get too rich. Provided you are getting good results with the throttle only partially open, we do not advise you to interfere with it.

Trouble in Gear Changing.

Will you kindly give me your advice on the following troubles which occur on my machine: (1.) I have lately purchased a 1911 model 7 h.p. V.S., with atmospheric inlet valves. The two-speed gear is in the hub, V.S. hand lever on the side of the tank. When I start the engine and change from free to low gear the machine will scarcely move unless I run at a good pace with it, and can only change into direct drive when going at about 10 m.p.h. down hill; it then changes with a terrible jerk and noise. If I attempt to change under above rate it pulls up dead. I have a nearly new 1in. Whittle belt which, on these occasions, is usually broken. The engine will gradually stop at every little rise in the ground, and seems unable to pull the load. (2.) Should I raise the exhaust valve when changing gear? (3.) It is fitted with a B. and B. single jet carburettter. What size jet would be best for this combination? (4.) Do you think the above faults are caused by the carburetter, gear, or engine?—H.H.

(1.) It looks very much as if something was binding in the low gear, causing too much friction, from the symptoms described in your letter. The only thing to do is to see that everything is perfectly free, and not to attempt to change up too early. As you are a novice you would be well advised to have the machine examined by a competent man. (2.) Of course, you must lift your exhaust valve when changing, and not drop it until the top speed is engaged. (3.) You should try a No. .033 jet. (4.) We should say the trouble is caused by some defect in the gear.

READER'S REPLY.

Tyres for High-powered Sidecar.

Being actively engaged in retreading motor cycle tyres, we venture to take mild exception to your statement in reply to "Cedax," in a recent issue, that retreading is sometimes rather a lottery. If *every tyre* sent for retreading was put in hand, your remark would doubtless be fairly true, but what reputable firm would do this? "Cedax" can be quite assured that if his cover is despatched to a responsible firm, with a reputation, it will be minutely and expertly examined, and only retreaded if, in the opinion of the firm's experts, good service is likely to result. This is our invariable rule with both car and motor cycle work, and in the course of the last ten years we have retreaded many thousands of covers, and have also rejected a great many thousands.—ALFRED ROBERTS AND SONS, LTD.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"J.G." (Staffs).—2¾ h.p. twin Levis.

"R.R.M." (Sleaford).—Wall Autowheel.

"B.R." (Leeds).—Brampton variable gear, especially with regard to free engine and belt wear.

"S.P." (Stroud Green).—2 h.p. Humber, single speed. General capabilities, wear of belt, etc.

"W.M." (Birmingham). — 2½ h.p. Veloce. Forced lubrication and metal-to-metal clutch.

"A.S.R.M." (Mysore).—1913 F.N., four-cylinder, with sidecar. Flexibility, reliability, consumption; also a.o.i.v. 7 h.p. 1913 Indian with sidecar.

"V.A.R." (Ruthin). — Benzole with 8 h.p. Matchless-Jap, Amac carburetter. Whether any alterations necessary to carburetter, size of jet, etc.

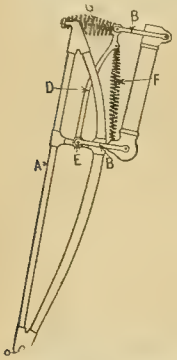
"W.S.W." (Enfield).—7 h.p. blue Indian, two-speed F.E. and sidecar, also solo. Wear, reliability, hill-climbing, consumption, and ease of control when used solo.

DANGEROUS CANAL BRIDGES IN CHESHIRE AND LANCASHIRE.

A typical example of a dangerous canal bridge on the Altrincham Warrington Road is shown above. The Roads Improvement Association is making an effort to have them removed. Though examples are encountered in all parts of the country they are most common in Cheshire and Lancashire.

A Spring Fork.

The link system of this fork permits movement of the wheel, not only vertically, but in a longitudinal direction. The girder A is connected to the top and bottom of the steering head by pairs of links B, the upper links being connected to the girder through a strut D. A pivotal support is afforded for the girder at E, permitting the compound action referred to. The disposition of the springs is clearly shown in the drawing, F acting for the vertical component, whilst the longitudinal movement is under the restraint of the spring G.—A. J. Hayes, No. 19,705, 1912.



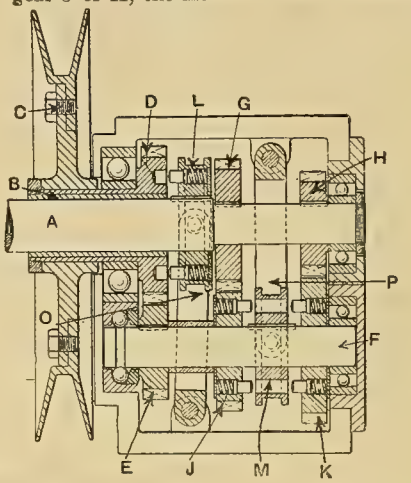
PATENTS

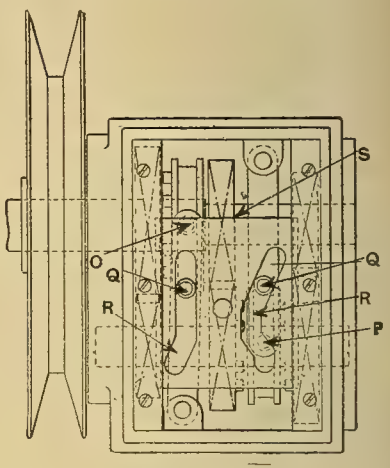
BY

ERIC W. WALFORD, F.C.I.P.A.

A Three-speed Gear Box.

The sectional plan shows the arrangement of the gears. The shaft A is driven from the engine, and has loosely mounted upon it a sleeve B to which is attached the driven pulley C. On the sleeve B is secured a gear wheel D, which meshes with a similar wheel E fixed on the layshaft F. On the driving-shaft A are keyed further gear wheels G H, engaging others J K on the layshaft. Clutch devices L M are arranged on the driving-shaft and layshaft respectively; the actual engaging means comprising spring plungers on the one part taking into holes in the other part as shown. Operation is effected by forks O P, which can rock about their pivots. When the clutch L is engaged with the gear wheel D the drive is direct. On disengaging this clutch and engaging that M with either gear J or K, the motion is from the main-shaft through the gears G J or H K to the layshaft, and thence through the gears E and D to the driven sleeve. The plan view shows the means of actuating the forks O P. Each fork has a projection Q, which is engaged by cam slots R in a plate S movable over the top of the gear box. It will be seen that, owing to the angularity of the slots, movement of the plate will effect rocking of the forks O P, and this movement is so arranged that engagement and disengagement of the gears is effected in progressive order, and no gear is engaged until that previously in operation is taken out.—J. Doherty and the D.H.K. Motor Cycle Specialities Co., Ltd., No. 23,519, 1912.





Armstrong Gear Success.

In the recent Midland reliability trial only two lightweights were successful in gaining gold medals, one of these being G. Taylor's 2½ h.p. Connaught fitted with the Armstrong gear.

Puch Motor Cycles.

Messrs. Sidley, Crawley, and Gates, Ltd., 115, Fore Street, E.C., will exhibit models of the Puch motor cycles at the Show. These are, we understand, at present being re-designed to suit the requirements of the British rider.

Up the Stelvio on a Douglas.

A postcard from Mr. Edmund Bacon (of Twickenham, Middlesex) announces that he has succeeded in climbing the Stelvio Pass, despite the snow and newly mended roads, on his 2¾ h.p. Douglas. Up to that point the machine had run 8,436 miles, and all Mr. Bacon found necessary to do was to grind the valves and scrape the cylinders.

A Novel Wicker Sidecar.

Mr. W. E. Manning, sidecar manufacturer, St. John's Works, 85, South End Road, Hampstead, N.W., informs us with reference to a neatly designed wicker sidecar attached to a 2¾ h.p. Douglas, illustrated on page 308 of our issue of the 9th inst., that this is a design registered by him in July, 1912. Mr. Manning makes a point of supplying similar sidecars which weigh only 46 lbs. to the F.N. motor agency for their light machines, and to Messrs. Robertsons for such machines of medium power as the Douglas and twin Humber.

SPARKLETS

Gaulois Road Atlas.

Messrs. Gaulois Tyres (1909), Ltd., 6, Bath Street, City Road, E.C., have lately published a road atlas of the British Isles, which is quite clear and excellent for following the principal roads in the country. It is thin and bound in stiff paper, and can be conveniently carried in the pocket.

Waterproof Gloves.

Asbestol waterproof gloves, to which we have made previous reference in *The Motor Cycle*, are to be supplied to the Aviation Corps of the French Army. They have been subjected to very severe tests during the past twelve months, from which they have successfully emerged, and are used by a large number of motor cyclists in this country.

New Home of Precision.

F. E. Baker, Ltd., makers of the Precision engines, notify us that their address now is Precision Works, King's Norton, Birmingham. The new works are three minutes only from King's Norton Station, to which there are frequent trains from Birmingham (New Street Station). The telephone address is: King's Norton 184 (two lines).

The 3½ h.p. Ariel.

All the awards in the recent Falkirk and District M.C.C. reliability trial were made to Ariel riders, viz., J. Cameron, E. Shakespeare, A. M. Cockburn, and R. M. Hope, all on 3½ h.p. Ariel motor cycles.

In addition to the ordinary prizes, J. Cameron was awarded the special prize for the best performance in the solo class and R. M. Hope in the passenger class.

Rom Tyres for 1914.

For next year the Rom Tyre Co. will continue to specialise in their well-known combination cover, which is one of the most successful tyres of this type manufactured. Among the novelties we may mention a new rubber-studded cover to go with the 2¼in. combination cover on the front wheel, designed to fit 2¼in. rims. The chief feature of these tyres is the thickness of the tread. The round tread, 650 × 65 mm., cover is sold at a very moderate price.

Albion Two-speed Gear.

In describing last week the new two-speed dog clutch counter-shaft gear introduced by the Albion Engineering Co., Ltd., we inadvertently referred to Messrs. Harris, Sons, and Co. as the makers (the title of the original firm). We publish this paragraph in order to correct any misunderstanding our reference may have caused, as the Albion Engineering Co. took over the business some considerable time ago.

For 1914—*all* Twins

N.S.U.

FOR 1914—many ingenious detail refinements, and the use of twin-cylinder engines exclusively, is the N.S.U. programme. Increased efficiency—smart appearance—and very advanced designs, ensure a popular demand for the new models.

3½ H.P. Twin-cylinder, 493 c.c., two-speed gear and free engine, belt drive.

6-7 H.P. Twin-cylinder, 870 c.c., chain drive, three-speed countershaft gear, 26×3in. tyres.

7-9 H.P. Twin-cylinder, 996 c.c., chain drive, three-speed countershaft gear, 28×3in. tyres.

THE N.S.U. TWO-SPEED GEAR AND FREE ENGINE PULLEY

can be fitted to practically every well-known make of motor cycle. Is lighter than any other gear on the market—and remarkably frictionless on the low speed.

£7 0 0 - - - (with fixed pulley)
£8 0 0 - - (with adjustab'e pulley)
Including all Fittings.
IDEAL FOR SIDECAR WORK.

THE N.S.U. MOTOR COMPANY, LIMITED.

PRIVATEER (a good cheap tyre) - - - - - - -	„	23/3

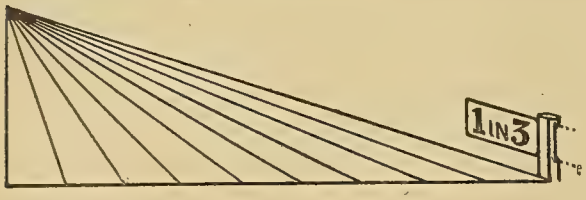
A Tyre to suit every class of rider.

The above-mentioned tyres are absolutely the best possible value ever offered to the motor cycle owner, and can be relied upon for durability and efficiency.

Write for Illustrated Booklet—

THE PALMER TYRE LTD., 119, 121, 123, Shaftesbury Avenue, LONDON, W.C.

MOTOR CYCLE DEPOT: 103, St. John Street, Clerkenwell, E.C.



Climb 1,750 feet in a mile, and you

will want to have motor-cycle tyres which grip any surface—which will stand frightful bumps and shocks, and sharp stones. At least that is what Messrs. W. B. Little, Raymond Drinkall and T. B. Westmorland found on their recent famous climbs of redoubtable Skiddaw and Helvelyn.

¶ All three of these daring riders used Stelastic tyres. Skiddaw is 3,058 feet high. There is a rise of 1,750 feet in less than a mile—an average gradient of one in three. At many places the grade is almost one in two.

¶ There is no road or pathway. For a long distance the surface is covered with loose stones of shapes and sizes calculated to strike terror into the heart of any rider —or tyre!

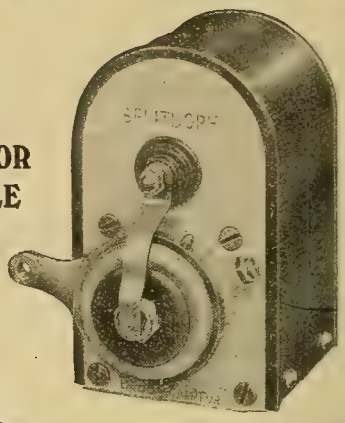
¶ But, as is now motor-cycling history, all three of these Stelastic users accomplished this marvellous climb with flying colours. On Mr. Little's machine were the same Stelastic tyres which he used in the Six Days Trial.

¶ Do you know the unique construction of Stelastic tyres which makes such almost unbelievable wear possible? Let us send you printed matter which tells about the wonderful Stelastic Tread, in which woven steel "meshes" "give and take" in perfect harmony with the purest Para rubber. Stelastic tyres are absolutely cut-proof, and almost impossible to puncture. If you do not know the address of the Stelastic Depôt nearest to you, we shall be glad to advise you.

STELASTIC TYRES, LTD.,
76, York Street, Buckingham Gate, London, S.W.

Stelastic Tyres

TRADE SPLITDORF MARK **SPLITDORF** TRADE SPLITDORF MARK



MOTOR CYCLE AND CYCLE CAR

TRADE SPLITDORF MARK **MAGNETO** TRADE SPLITDORF MARK

Represents the very best in design and workmanship. Its use on your motor cycle or cycle car will insure you against all ignition troubles.

WATERPROOF — DUSTPROOF — FOOLPROOF.

Built by a firm who entered the ignition field in 1858 and have been making magnetos ever since their adaptation to internal combustion engines.

Remember: Experience counts. A trial will convince.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.
York and Lancashire.

SECTION III.

Phone—Holborn, 5777. Wires—"Opificer, London.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry" or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

Mending tyre covers.

Next time you have a bad cut or gash in your cover **don't scrap it.** It may look quite hopeless, but ten to one you can save it—with the aid of Chemico Tyre Stopping.

This stopping is a plastic preparation which placed in the cut or gash quickly amalgamates with the material to which it is added making a **perfect repair.** It is easy to use, cannot fall out, sets quickly and is permanent. It is **not** a liquid. Get a tin to-day and have it handy.

CHEMICO TYRE STOPPING.

CHEMICO CARBIDE—

The "All Service" Carbide.
Every particle in a tin of Chemico Carbide yields the maximum amount of gas. All impurities are removed, and the carbide itself carefully coated.

½ lb. tins 4½d. 1 lb. tin 7d.

RELIANCE PATCHES

Enable you to make a permanent repair, that is a real mend, by the roadside. They are faced with pure Para Rubber. When solution is applied, solvent action is set up, resulting in perfect cohesion.

In all sizes from 1d. upwards.

Security

OUR "STANDING" in the motor trade is your SECURITY.

The fact of our having merited the distinction of being appointed Official Repairers to the three representative Motoring Organisations of the Kingdom is evidence of our worthiness and reliability

If you purchase a new Motor Cycle or Cycle Car from us you will have the satisfaction of knowing that your order is entrusted with a firm who are accredited Agents of all the leading manufacturers.

We are very jealous of our good name, and we avoid the possibility of a dissatisfied customer by very carefully overhauling every second-hand machine and holding ourselves absolutely responsible for them by a written guarantee.

The following is a selection of our second-hand stock:

Date.	H.P.	Particulars.	Price.

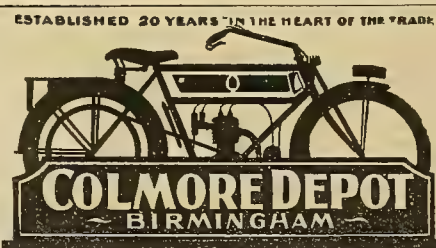
ESTABLISHED 20 YEARS IN THE HEART OF THE TRADE



COLMORE DEPOT
BIRMINGHAM

The time to buy is NOW! Agreed!!
The question in your mind is WHERE?
In deciding this the leading thought should be—Shall money be spent

BEFORE OR AFTER

the purchase? Many seemingly extraordinary bargains, offered at low prices to attract, become, upon enquiry, very dear, inasmuch as *pounds in some cases have to be spent on them after purchase*, making the ultimate cost very heavy; but when the COLMORE DEPOT is made the market, *first cost is last cost*, and, except for replacements due to wear and tear, no further expenditure beyond the purchase money is necessary. Every Colmore second-hand is PUT RIGHT TO STAY RIGHT by skilled mechanics before sale, and the purchaser is thus assured of a complete "*no trouble*" motoring career.
